come down in size, I think the current White Book number is 16, but the actual number of people who work in the press office in one way or another is closer to 30. That includes, for example, press officers who specialise in Urdu language work and in Arabic language work in London, that is the London team. The total budget for which I am responsible is considerably larger than that, it is £497 million a year, but that is because I have managerial responsibility for the Foreign Office's funding relationship with the BBC World Service, with the British Council, with Wilton Park and with the scholarship programmes that the Foreign Office runs. Clearly that is a very large number, but it would be a mistake to confuse that with something to do with press officers or whatever.

Q330 ***Chairman:*** You have got 16 regular press officers, have you?
Mr Hargreaves: That was the number at the official census in the White Book. It moves around a little bit. It is a team of almost 30 people if you take into account the people who provide support services like photography and various web-related activities and other things that these days you need in a press office other than individuals who can take telephone calls and make telephone calls to journalists.

Q331 ***Lord Inglewood:*** In terms of your figure for press officers, that does not include people based in embassies outside this country dealing with the press and the media abroad, is that right?
Mr Hargreaves: It includes the London team only, yes. We have a global network of just under 250 UK missions overseas. Large missions have got substantial communications capacity. With small missions the communications task is part of an individual's job who will be doing quite a lot of other things as well. That is not a number that we have computed.

Q332 ***Chairman:*** We might ask you to do so.
Mr Hargreaves: We could do that. It would be an estimate.

Q333 ***Baroness Eccles of Moulton:*** Do your 122 communicators have anything at all to do with the rolling out of the massive communications system between all patient health records?
Ms Jarvis: No. It will do in time. We are actually just transferring that team into our team, but that has not happened yet.

Q334 ***Chairman:*** Let us concentrate on the press for a moment and relations with the press because otherwise we might go all over the place. How do you define your role in dealing with the press? Are you there as public relations officers for any government? How do you avoid being dragged into politics? Is it really your job to fight out there for Ministers' policies? Is that how you regard your role?
Ms Jarvis: The rules around the Code of Practice for civil servants are quite clear and they were revised in 2006. It is quite clear from that that we do have a duty to explain and to defend government policy and to promote it to the public but obviously we would not do anything political. In many ways that is why it is very useful having two special advisers in the Department who we can call on, so we do not get dragged in to any political activity at all. Any work of that kind is given straight to the special advisers.

Q335 ***Chairman:*** So much of what you do in the Health Department is political. How do you make that division?
Ms Jarvis: I think you can make the division. Obviously something that is party political is quite obvious. If you are opposing Opposition policies, for example, that is not something that we would do, but if the policy is open to scrutiny then it is our job to defend it. We also have discussions around when is something actually a managerial issue. Obviously the media always like to—and tend to—turn everything into a political issue because the NHS has become a bit of a political football. Quite often, if it is an operational issue around infection rates or financial spending stories, then wherever possible we get the Chief Executive to present and to defend those issues. Increasingly what we have done is we have a whole number of national clinical directors who have as their subject area maybe cancer, mental health or older people and they are trusted voices to the public and they are able to present stories in a way that is not always entirely political.

Q336 ***Chairman:*** So you are not just responding, are you? You say you defend the policies. Does that mean by any means basically? Even if the policy is wrong you defend it, do you?
Ms Jarvis: Our job is to actively promote and to explain government policy and I guess to a degree there may be an element of defending it because in explaining it you are trying to make the case for why it works.

Q337 ***Chairman:*** That was the word you used.
Ms Jarvis: Yes, I did use the word defend.

Q338 ***Chairman:*** When do the two special advisers come into play?
Ms Jarvis: We have a close working relationship with the special advisers. In health we have a very good relationship with them. Every week we meet for a formal meeting where we go through our long-term planning grid, so we will go through the stories that we know are coming up for announcement that week

or indeed for the next few weeks and we are able to have a discussion about that. It is useful to have them at the meeting. We also have the Secretary of State's Private Office there so that if our discussion should stray into issues around policy or questions of policy then the Private Office is able to pick those up. As the Private Office works closely with the Secretary of State they have a very clear view of what is in his mind and they are able to bring that to the table which saves a lot of time sometimes.

Q339 ***Chairman:*** And the special advisers would deal with a ministerial speech in a party context, for example, a party conference or something of that sort?
Ms Jarvis: If it was in a party context we would not be dealing with it. If there was a speech, for example, and there was a section which was quite blatantly political, we would not publish that either. We would ask the special adviser to put that out through the party. We are very clear about those dividing lines.

Q340 ***Chairman:*** What kind of paragraph would that be that you would excise?
Ms Jarvis: If it related directly to the Opposition, for example. If it was an attack on their policies specifically then we would not put that out.

Q341 ***Bishop of Manchester:*** One of the largest factors that I imagine your Department is going to have to cope with sooner maybe rather than later is the pandemic flu. I imagine that is going to be a far greater factor than the obesity issues that you are dealing with. How are you coping with the plans for that issue in terms of communications and indeed budgeting?
Ms Jarvis: We have got very well prepared plans. We have a pandemic board which either I or one of my deputies sits on, and we have a whole grouping of scientists, so we have a communications plan in place. We also have a strategy for dealing with pandemic flu. I have not got the budget figures for that here but I can get them to you.

Q342 ***Lord Grocott:*** A huge proportion of your communications work presumably is information that needs to reach the public. We talk about press officers and the press and relations with the media and everything else, but with all due respect to our friends in the press, from your perspective and the public's perspective they are simply the conduit which may or may not work. Obviously think pieces and everything else come en route, but there are huge areas of your policy where it is absolutely vital that the message gets to the public. How important are the media to you in that crucially important area of your communications strategy? Are they a help or a hindrance? Secondly, is there any way in which you can differentiate in your budget that part of the budget which is dealing with the media and that part of the budget which is dealing with the public? I suppose my prejudices are inherent in the question. I think it is very important the public knows.
Ms Jarvis: I will take your first question first. Sometimes they are a help and sometimes it feels like they are a hindrance. I think for us in health it is a slightly different engagement with the media because obviously we are a huge public service. We treat one million patients every 36 hours. There is a point at which with the information that we are putting out, whether it is through the media or directly to citizens, we cannot go far from the truth because people will see it with their own eyes and obviously they have their own experiences and so if we do get it wrong then we are going to hear about it very quickly. We have a huge respect for the media, we have very good working relationships with the media, but we also endeavour to get out direct information to the public wherever possible, perhaps through our new website. NHS Choices has been a fantastic innovation that went live in 2006. The public are able to go on there and get information about their local hospital. They are able to see and compare MRSA rates, for example. They are able to make informed choices based on information like that. They are also able to get information on 700 different conditions, but for those who cannot access NHS Choices, GPs are able to download information in a user-friendly way so that they can hand it to patients as well. We have got a whole range of communications where we try to speak directly to the public. We are very clear about the budgets.

Q343 ***Chairman:*** I just want to go back to your attitude to the press and how you define your role. Ian, what do you think?
Mr Hargreaves: I think anybody who has worked most of their life in journalism, as I have, knows that probably the most valuable thing you can get from a press officer in any organisation is speedy, accurate information which deals with the gaps in your knowledge that you have when you are doing the story. That is undoubtedly the most valuable thing that our press officers provide. Therefore, there is a high premium on a balance of expertise and access to expertise in a very tight time-frame. On the issue of whether that is promoting or defending government policy, I think that inevitably and correctly it is. If the public is to understand what the Government's stance is on the conflict in Afghanistan, for example, then press officers have a role to play in explaining the circumstances on the ground in Afghanistan as best that we can. We work very closely with Nick and his colleagues in that. It is a balance of information and context. Does that stray into something unacceptable? As Sian says, we are governed by the

Civil Service code and I think that everybody who works in our press office is very clear about what the rules are.

Q344 ***Chairman:*** Speedy and accurate information is quite a good way of putting it, is it not? It has to be accurate.
Mr Hargreaves: It does indeed.

Q345 ***Chairman:*** How do you do it in Defence? How do you view your role?
Mr Gurr: I would agree very much with what my colleagues have said. One of the important changes that have been brought about in recent years as a result of Phillis and also the work that Howell James did is that we are engaged now right at the beginning of policy formulation, we do get involved from the outset and we are consulted throughout. That was not necessarily always the case. It certainly was not the case when I was in policy jobs a decade or so ago. Through the process that we have now it is much more likely that if a policy does have presentational flaws which might in turn mean that it has flaws full stop, we can discuss those at an early stage and they can be factored into that policy as it is worked forward. Above all what I want is a productive relationship with the media where they feel that they can come to us and get accurate, timely advice on the issues that are of concern to them. Over the last couple of years we have put a huge amount of effort into rebuilding a relationship with the media, which I think had suffered quite considerably at the time of the Iraq War and the events that followed that, and I think we have made an enormous amount of progress. I would echo Ian's point about expertise in the press office. Sometimes the media will want to speak to somebody who has got current military expertise, and we make sure we have people who have got that and can talk from that experience. In fact over the last year or so we have doubled the number of military officers in our press office so we can provide that.

Q346 ***Lord Maxton:*** Ms Jarvis, an obesity campaign is not just a matter for your department, although the health issues are, the educational issue in terms of getting children to eat properly is a matter for the Education Department. How closely do you work with your equivalent people in other departments?
Ms Jarvis: We work very closely and very well. Obesity is a very good example because I think it involves six different government departments. We decided that the most effective way of doing that, apart from email, is to have a monthly meeting actually specifically on that issue. So while we have the directors of communication meeting where we discuss a whole range of topics, we have also singled this out as being a particular issue that we want to focus on. We have a network of communicators and a network of policy officials as well, and we share PSAs as well on this particular issue.

Q347 ***Chairman:*** We have had evidence from journalists which probably has been brought to your attention. We have had evidence from Tony Collins, the Executive Editor of *Computer Weekly*, who did not seem particularly happy with the way that he had been treated by the Department of Health. He said that on one occasion he was actually excluded from a press conference on the grounds that the Department took the view that he would not be particularly interested even though it was about IT.
Ms Jarvis: I am aware of his comments and his criticisms. I was not in post at the time: I was on maternity leave, so I cannot speak first-hand, but I have spoken to my colleagues about this particular incident. There are some other facts of the case that I would like to put on the table which will help with the context, if I might do that. From time to time on particular issues we will organise bespoke briefings. If there is a big announcement obviously everybody is invited and we respect the primacy of Parliament and we make the announcement there first. Sometimes we want to bring a group of journalists up to speed on a particular subject and in this case we identified that the health lobby did not have as much information about the national programme for IT. That particular group of journalists, who work together a little bit like a pack, we invited in for a special briefing. We did not invite the trade press—Tony Collins is part of the trade press—because they had so much information about it. They wrote on it every single week and had intimate knowledge of it. So Tony Collins was not invited, he was not on the list. We had not made arrangements for him. Had we invited him we would have had to invite all his trade colleagues. The daily press officer who was handling the event excluded him because he was not on the list.

Q348 ***Chairman:*** You had an expert in computer science there who was actually following the national IT programme.
Ms Jarvis: We were giving very basic information in order to bring health correspondents up to speed on the subject. There would have been nothing that he did not know. If he wanted to have a specific meeting with the official or the Minister, that is something that we would have considered.

Q349 ***Chairman:*** You made this contrast between national and trade press. You could say the trade press is actually rather expert press, could you not?
Ms Jarvis: Yes, you could call it expert press as well.

Q350 ***Chairman:*** Do you really think it is justified to physically exclude someone from a press briefing?

Ms Jarvis: There may well have been better ways of doing it, but he was not invited. We did not set out to exclude him, but we did not set out to invite him because it was a bespoke briefing organised for another grouping of journalists. I would also add that not only do we have the specialists or the trade press, we have the health lobby and they have very different deadlines, different interests, different angles on stories from the political lobby and also from the regional and local lobby. We try to respect their differences, which is what they ask us to do, and we try to treat them in a different way in order to give them what they need.

Q351 ***Chairman:*** It did not cross your mind that you would get a nicer story if you did not have an expert there asking awkward questions?
Ms Jarvis: It was not about getting a story. It was a background briefing.

Q352 ***Chairman:*** Background briefings normally lead to something, do they not, otherwise it is a waste of time?
Ms Jarvis: We sometimes call them fireside chats or background briefings. We do them on a regular basis in order to make sure that journalists have a lot more information and context. Obviously they are busy people too, but we like to give them the opportunity, for example, to speak to national clinical directors about a particular topic area like cancer so that they get a much better understanding. We are educating them about what might just lie behind the headlines.

Q353 ***Lord Inglewood:*** You mentioned that you have a number of lists. Who compiles the lists? Do you compile the lists or can any journalist put himself forward and say "I would like to be on that list" and have the right to go?
Ms Jarvis: Which lists are you referring to?

Q354 ***Lord Inglewood:*** You were referring particularly in the context of Mr Collins—
Ms Jarvis: The briefing for the lobby?

Q355 ***Lord Inglewood:*** There seems to be a series of different lists of people for different topics. Can anybody say, "I would like to be on that" and be asked, or is it you at the centre who compiles the list and says we want A, B, C, D and E on it?
Ms Jarvis: Anybody can be on our standard list for the issuing of press releases. They can also go to the website where everything is published. Anybody can be on our list for information that we send out on a routine basis. When we organise bespoke briefings that is exactly what they are. Sometimes journalists come to us and say they would like to be brought up to speed on a particular topic either of interest or because they feel that they have not got all the facts, and we will happily do that, whether it is with a leading official or sometimes with a Minister. Sometimes we organise briefings around particular topics because we think that it is something new. On obesity, for example, we will probably organise a background briefing, and we will also have the formal announcement, in which case everybody can come, but there will be people who perhaps have written about a particular subject or who we know need information, and for them we will organise bespoke briefings. If somebody has an interest they can call us, say that they have a special interest, put their hand up and we will make sure that they are on whatever list we compile for particular briefings.

Q356 ***Lord Inglewood:*** If this character had wanted to come to your briefing then what you are saying is he should have said, "I know you're doing this briefing. May I come?" and you would have said yes. Is that right?
Ms Jarvis: I still might not have said yes simply because it was a special briefing to bring health correspondents, who did not have much information, who did not have much understanding about the topic areas, up to speed.

Q357 ***Lord Inglewood:*** I can understand that. What I am trying to work out is where the initiative lies here. Is the selection with you or can anybody have the right to ask to come?
Ms Jarvis: Yes. He could then ring us and say, "I would like my own briefing", or "I would like a briefing for the trade press in order to bring us up to speed", and we would then consider that.

Q358 ***Chairman:*** So he would have to have a separate briefing, would he? According to his evidence to us, he did ring and he did ask whether he could go and he was told that the conference was full.
Ms Jarvis: That may well have been the case, because if we had organised a briefing for a certain number of people then there would only have been enough room for a certain number of people. I was not there at the time: I was not in post. I have tried to find out to the best of my ability what actually happened.

Q359 ***Lord King of Bridgwater:*** There is a rather more serious point that emerges out of this. You have just said that if somebody said they would like to have a fuller briefing with somebody or perhaps even talk to a Minister about something you would be happy to arrange it. The allegation Mr Collins makes is that he and his editor were told you were not happy with their coverage and unless they wrote more articles that the Department was happy with they would not get that access. Those were the bad old days, and without going over the bullying that used to go on and the allegations about what Alastair

Campbell was doing, I thought the new administration had cut that right out. Would you like to comment on that point?
Ms Jarvis: I think it is very difficult for me to comment. That is their allegation. That is not what I have heard in the investigation, but I am happy to investigate further. I think it is easy for people to make allegations and accusations. I am very proud of the press office and the way that they conduct themselves. I am sorry that in this case it seems to have caused offence. It certainly is not our intention to do so. It is always our intention to be as helpful and as open as possible and I absolutely underline that.

Q360 ***Chairman:*** Mr Collins is not the only person who has made a complaint to us. We asked Nigel Hawkes, the Health Editor of the *Times*, how he found his relations with the Department of Health, and "not particularly good" was his reply. He found himself agreeing with Adam Boulton, who had also given us evidence, saying that he would not these days ring departmental press officers to find out what was happening. Nigel Hawkes' main criticism -and he is a very experienced journalist—was that there has not really been any greater openness since 2004 and the Phillis report and that everything is trailed. When a report is coming out it is embargoed for a certain time but, nevertheless, journalists who are likely to take a favourable view of it are then told about it. He gave a number of examples of that, including the Darzi report, which was apparently trailed in every paper, and the annual report of the Chief Medical Officer. Do you preannounce things and trail things in advance?
Ms Jarvis: We always respect the primacy of Parliament, so we do not preannounce big announcements like the Darzi report.

Q361 ***Chairman:*** So how did it get into the press beforehand?
Ms Jarvis: We can put out information more generally about the fact that the Darzi report is coming and some of the themes that will be in it, and I think that is entirely appropriate. In order to promote government policy we want to get on to the front foot, but that is not making any announcements. The journalists are incredibly hungry. When you have got something like that coming in they are really, really hungry. They have got very good contacts. They will go to all sorts of sources. It does not take much to present a story that looks like it might be incredibly well briefed which is based sometimes on speculation or a perfectly sensible comment about maybe the themes that we are tackling or the problems that we want to address and it looks as if everybody has had an incredibly well-briefed story, which is not the case and certainly was not in the case of Darzi.

Q362 ***Chairman:*** The press stories on Darzi were wrong, were they?
Ms Jarvis: There was no detail about what was coming up. The thing about Darzi to remember is that it was not our information to hold on to. We launched a massive consultation which lasted for a whole year in designing Lord Darzi's policy. We had consultation events all around the country. We involved 2,000 doctors and 60,000 members of the public. We had deliberative events. I went to one myself where we were able to discuss local properties—that is, what did local people want from this report. What I am saying is that there is an awful lot of information out there. We had already briefed every single strategic health authority so that they were prepared. We were more open than I think we have probably ever been both with journalists and with the public and with clinicians and local managers. There was no sense that there was a secret story.

Q363 ***Chairman:*** When you say you briefed strategic health authorities, do you mean you briefed them on what was in the report?
Ms Jarvis: Yes, we did. We did not brief them on every single detail of it because obviously we had to go to Parliament first—

Q364 ***Chairman:*** You keep on saying that. It sounds to me as though Parliament comes a very long way down the list.
Ms Jarvis: Much of Phillis was about a much, much closer engagement with the public, putting the citizen at the heart of policymaking and the heart of service delivery. It strikes me that it is very difficult to do that unless you are very open with information. When it comes to the actual detail of reports that go to Parliament, obviously we make sure that in the detail of specific announcements and policies we respect the primacy of Parliament. I think the way that we handled the Lord Darzi report was extremely professional. We had very good coverage for it. It was embraced by doctors mostly. It was also supported by the public. We almost do not own it any longer is what I am saying so it is very difficult for us to be necessarily in control of every single detail. With Adam, I think it is a very unfair criticism: I know he described press officers as "puny". I do not know if it is worth me describing to you the context that our 30 press officers work in. On the news desk we have five press officers and they deal with between 10 and 20 health stories a day, sometimes up to 30 on any busy day. Each of them is taking 40 calls, and they are all trying to respond, for example, in Sky, to a rolling news deadline throughout the day and also, in terms of the national newspapers, they like us to have our lines and a response by 5 o'clock. These are very, very pressurised jobs. People work under

extreme pressure. I am incredibly proud of my press officers. They have huge amounts of integrity. They have an enormous sense of responsibility about the work that they are doing and they always try to do it to the best of their ability. I think in general, despite the three that you have picked out, we have an extremely good working relationship.

Q365 ***Chairman:*** They are not the three we picked out, they are people who gave us evidence.
Ms Jarvis: I agree.

Q366 ***Baroness McIntosh of Hudnall:*** The question I want to ask has a broader application than simply in relation to health. You have said several times that you respect the primacy of Parliament, which is admirable and part of what you should be doing, but what you are describing is an environment within which the primacy of Parliament is very hard to sustain. I wondered if you were aware of the evidence that we had last week from journalists within which it was clear that there is really no way of controlling information and retaining the integrity of formal structures about the way information is passed on because there has always been and there will always be a sort of parallel universe in which, as you yourself have just described, information is passed on, researched, dug out or otherwise brought to light through informal connections between journalists and people who are not necessarily under your control, in fact very often not under your control. Within that general environment what role do you see for your Department in terms of preserving some of the integrity of the relationship between Government and Parliament, for example?
Ms Jarvis: There are certain things that will be announced to Parliament where maybe after hearing from huge numbers of the public and doctors and all the rest of it about what policies they want in a particular area obviously Government nationally has to design a national framework for what the policy might be or enablers might be in terms of workforce, for example, money and those are issues that are in our gift. We do not brief on those facts before we go to Parliament. The information that I am talking about is really about getting a deep insight and understanding from citizens and from people who work in the service, who really understand what it is that they want—maybe the public do not always understand what they want and need—and need from their local services or in order to make behavioural changes like changing their lifestyle or diet, giving up smoking, for example. We have made dramatic improvements in getting to grips with that and we are making some very exciting developments which are shown in our tobacco campaign, for example. The things that we are talking about may come over as information. One woman who had recently had a baby was talking about her experience, for example, and how it was really important that she wanted to have the same midwife, she wanted that continuity of care. What we then had to do nationally was look at what all that meant. We wanted local strategic health authorities to publish their vision documents locally because they were responding to local need and local priorities. We then had to identify what were the enablers in policy terms that we would need to put in place to make sure that everybody could do what it was that they wanted to respond to the public. Those things were in our gift. We withheld that. We announced it to Parliament. I think that that there is a place for everybody in all of this, but we have to get closer to the public and to the citizen.

Q367 ***Baroness McIntosh of Hudnall:*** The thing that I hear coming out of what you have just described is an admirable, well-constructed view of how you manage that kind of information, but in terms of what the public hears and the quality of the information that actually gets into the public domain and circulates, the information that is really making an impact is not coming through those formal ways of managing information, it is coming through the informal structures and therefore your ability to control how it is received or even to influence how it is received is very limited, is it not?
Ms Jarvis: To be honest, I am not sure I really understand what your question is getting at.

Q368 ***Baroness McIntosh of Hudnall:*** Let us take the Darzi report. You have described your very careful management of the way that, firstly, the report was created, and in parenthesis I would say it sounds to me from the way you described it as though you and your team were very much part of the development of that policy, a point to which we might come back, but do not respond to that now.
Ms Jarvis: I would not want you to think that that is the case. We are talking about making a policy here and we are working very closely with policy, which is one of the Phillis principles actually.

Q369 ***Baroness McIntosh of Hudnall:*** Yes, it is. I simply say in parenthesis that it sounds to me as though that is happening from what you have described.
Ms Jarvis: I am sorry if I have misled you.

Q370 ***Baroness McIntosh of Hudnall:*** I do not think you should be sorry. The more important point that I am trying to get to is that all of that careful management and very careful iterative process that you have described between collecting public information, feeding that back into the policy process, codifying it and making it into something

that can then be announced is running in parallel with another kind of interpretive process that is going on through the informal networks that journalists have which is going out alongside your carefully managed information as another way of looking at the way that that policy has been developed. Is that not the case? It does not seem to me to be a very controversial thing to do. It is just a fact, is it not?
Ms Jarvis: You mean that the media are not then reflecting properly what it is that local people are saying or what it is that we are trying to do?

Q371 ***Baroness McIntosh of Hudnall:*** What it is that you are trying to get them or encouraging them to say is actually not necessarily what they are going to be encouraged to say.
Ms Jarvis: You might be right to a certain extent and I think that is probably why we have tried to find all sorts of other ways of getting information out to the public which are unmediated through the media—it is something that we cannot ignore—and through social networking sites, for example, we used Netmums and Mumsnet. As part of the Darzi review they were very, very closely involved. They held what they call coffeehouses where they have forums. We had Lord Darzi doing web chats on there. We are trying to approach it from all sorts of different ways to get that closer engagement.

Q372 ***Lord King of Bridgwater:*** Mr Gurr has come up through the system. You were an internal candidate for this. Mr Hargreaves, presumably you were appointed by David Miliband to the position and had an interview with him before you were appointed, is that right?
Mr Hargreaves: No. I was appointed by a Civil Service process.

Q373 ***Lord King of Bridgwater:*** You never saw the Minister before you took up your job?
Mr Hargreaves: I have seen the Minister. I have known the Minister for a very long time.

Q374 ***Lord King of Bridgwater:*** So you went through the Nolan process, did you?
Mr Hargreaves: Yes. Let me be precise about what happened. There was an open competition for an openly advertised post which took some considerable time. I was aware of that competition but did not enter it. When the competition failed to result in a decision that was satisfactory to the panel, which certainly, as you will recall from your own time as a Minister, does not involve the Minister or Secretary of State, that then led to a conversation between myself and the permanent secretary at the Foreign and Commonwealth Office in which he discussed with me whether or not there was a basis on which I would be prepared to take on this role that was consistent with the rules and procedures. There is a procedure which makes that possible but for a very limited period of time. I am on a two-year appointment which is technically known as a secondment and all of that was ratified by the Civil Service Commissioners.

Q375 ***Lord King of Bridgwater:*** Really?
Mr Hargreaves: Yes.

Q376 ***Lord King of Bridgwater:*** The Government has just published its reply to the Public Administration Committee today saying very clearly that the ultimate responsibility in public appointments rests with Ministers, and that remains paramount, and that Ministers must retain the right to choose. You are in a crucially important position for the Secretary of State and for the Ministers for the performance of that department. I find it extraordinary that you never saw him.
Mr Hargreaves: I am not saying I did not see him. What I am saying is that the process that was undertaken was that: that was the process that was undertaken. The basis on which I was then employed is the one I have just described to you.

Q377 ***Lord King of Bridgwater:*** One of the things we are going to come on to is the relationship with the press department and special advisers, and obviously it is very important that there is a harmonious relationship even though they have different agendas. I make no allegation here, but it rather gives the impression you are more of a political appointment if you are on a short-term assignment that might not last after a change of government.
Mr Hargreaves: Short-term assignments, if two years is short, are not unusual in the Foreign and Commonwealth Office. Two years is a normal tour of duty for a London-based job in the Foreign Office. That is not the system that I am part of, but I make that as a contextual observation. The question of why those responsible for the appointment judged me to be a suitable candidate I think is a question that they would have to answer.

Q378 ***Lord King of Bridgwater:*** I recall one chap, Andrew Burns, who would have been one of your predecessors in that job, who became our Ambassador to Israel and then came back. Some of these jobs have been done by ex-ambassadors, people coming through the service in that way. Who was your predecessor?
Mr Hargreaves: My predecessor was Lucien Hudson who had done a similar job in another government department prior to doing it at the Foreign and Commonwealth Office, although he, too, was somebody who had come into government service after having done many years working in journalism.

Q379 ***Lord King of Bridgwater:*** The point that interests me is that you are in a very challenging and important job. We have heard enough already of the extraordinary pressures that are on news communication press officers and all that is going on and this issue of changing people as frequently as that seems to me an absolute nonsense. What you need is a measure of continuity and experience if you are really going to discharge the role that is expected of you.
Mr Hargreaves: That is a point of view I share, but I think the correct answer to the point of view is that the right balance needs to be achieved. If you look at the team of senior people who report directly to me, the Head of News at the Foreign Office, Carl Newns, is a career Foreign Office man with deep experience in the way that the service works and he is clearly in a very important job; he is the Foreign Secretary's Press Secretary. You could say he and I offer some kind of balance in that regard. Likewise, one of my other direct reports, a man who runs our web operation, is also a career Foreign Office person. There is somebody I brought in from the Cabinet Office who is balanced in experience in cross-Whitehall working, and then there is somebody else who has come in from the private sector. We have a balanced team. One of the biggest problems that one is dealing with in government communications is trying to get this balance between expertise and professional competence which needs to be well-informed from contact with the outside world but also not to violate the standards and the principles and indeed the continuities that are also indispensable to doing the job well.

Q380 ***Lord King of Bridgwater:*** Ms Jarvis, you have come in from outside and been appointed. Historically that was unusual. I certainly do not resent it at all. Were you appointed by the minister?
Ms Jarvis: No. I was appointed by the Civil Service Commissioners. I applied through an ad in *The Guardian*.

Q381 ***Lord King of Bridgwater:*** But that was to come in as Head of News, was it not?
Ms Jarvis: Yes.

Q382 ***Lord King of Bridgwater:*** So that was at a lower level, was it not?
Ms Jarvis: Yes.

Q383 ***Lord King of Bridgwater:*** Your promotion to the position you have now was an appointment by the Minister, was it not?
Ms Jarvis: No. Of course it was not an appointment by the Minister.

Q384 ***Lord King of Bridgwater:*** The Government has just made quite clear that the ultimate responsibility is with Ministers for senior appointments.
Ms Jarvis: I see what you mean. They would have had to have approved—I am slightly rusty on this. At the time I think they would have put forward a single recommendation and that would then either be accepted or refused and in my case it was accepted.

Q385 ***Lord King of Bridgwater:*** The point which interests us also is this issue about access to people in your department. We get a tick for the MoD and the FCO, the officials who are dealing with the issues know what they are talking about, feel more confident about it perhaps and it is more difficult for the Department of Health. Can we just hear Mr Gurr's view on this? You are dealing with some jolly sensitive issues. You have got it at the moment with the sort of reports coming out from the frontline and retiring brigadiers and other people who say things are not going in the right direction. Would you like to comment on that, about letting people get access?
Mr Gurr: I certainly would. The nature of the work that we do in Defence does mean that there some things that we cannot talk about, and I know that can be a frustration at times to journalists, but I hope that they understand why those issues are there; they are often there because of the safety and security of our forces or for operational considerations. We are very much of the view that our own people are our best advocates and therefore we want to give as much access to them as we can. There are practical constraints associated with that, particularly when those people are serving in operational theatres and, at the moment, that is the area that the media really want to go and see them at work in. We think that they are doing an outstanding job—I echo what Sian said earlier on –we are very proud of what we do in Defence, and we want to show what our people are up to and give them the opportunity to talk about it. We do facilitate a large number of visits by people from the media to operational theatres—the numbers have doubled over the last couple of years both for the national media and media across the board—but demand does still outstrip the supply. The other sorts of things that we have been trying to do is to encourage commanding officers to talk about what they do to local and regional media, arranging background briefings to Defence correspondents, to the top decision makers in Defence, as well as the more general press conferences that we have for everybody. There are risks in this and sometimes we do find that somebody will say something from a perspective that perhaps does not see the overall picture. Sometimes someone will say something on an issue that perhaps they individually do not actually know that much about, what the Americans call the strategic corporal, commenting on the big

picture when he is only seeing a part of it. We do sometimes get criticism in the media as a consequence of those sorts of remarks and we have to deal with it, but I think that overall the benefit of allowing the media access to our people, particularly in operational theatres, does outweigh the potential risk.

Q386 ***Lord King of Bridgwater:*** Do you have specifically assigned people who are approved for talking to the press? We do have the sad memory of Dr Kelly who I think was one of those. Do you continue that process of having people, officials, serving officers or whatever they may be, who actually are designated as media participants?
Mr Gurr: Not in quite that way. What we do have is a process of authorisation, if you like. If somebody wants to engage with the media, they will seek authorisation. If it is regional media, usually through their own local public relations people in the brigade, command or whatever. If it is national media, usually they will come to us. An important part of that is making sure that people do get the support they need to deal with the national media and the training that is required. In operational theatres in particular, we do delegate a lot of this authority down the line. So, again an individual visit from a particular part of the country talking to their regional media who might be visiting Afghanistan, which is another thing that we try to encourage, support and facilitate, we will apply a pretty light touch about that.

Q387 ***Lord King of Bridgwater:*** Accompanied?
Mr Gurr: It depends. Again, there are different types of visit. We have a duty to look after these people and it would not be right to allow them to be roaming around in dangerous areas like Afghanistan and they would not be able to get around themselves. What we sometimes do is embed people in a local unit or a unit where they essentially live with that bunch of soldiers, marines, airmen or whatever for a period of days without any hands-on minding from our media people.

Q388 ***Lord King of Bridgwater:*** What about the Foreign Office?
Mr Hargreaves: We, as I think Tim Marshall told the Committee, make it a habit to try to put journalists in touch with the person most effectively able to help them. I think that there is not a good alternative to doing that, precisely because we are living in the world that has been much discussed this morning where the idea that you can command and control two or three information channels and shape the outcomes in a directive manner is a fantasy. You cannot do that, nor can journalists these days exercise the amount of control that they used to be able to exercise about the competitive framework in which they are working. The most dangerous thing in the world is an uneducated and uninformed journalist from everybody's point of view. From my perspective, it is a one-way bet. You make sure that you inform and open up to journalists to the maximum extent that you possibly can. Obviously there are sometimes circumstances where that is not, for some good reason, possible.

Q389 ***Lord King of Bridgwater:*** Poor old Department of Health, but actually what you have already given us evidence about suggests that the criticism made that the Department of Health discourages journalists from developing relationships with individual press officers and channels all media communication through one central phone number is not right, is it?
Ms Jarvis: For reactive. If you want a story on the day, yes, but people are able to develop relationships with press officers on particular topic areas, so we try to do both. We try to be responsive with the news desk, but we also try to allow people to develop close relationships and develop stories in a pro-active way.

Q390 ***Chairman:*** Who are your press officers? You were saying in Defence that there are a number of people with actual hands-on experience and is it the same in the Foreign Office?
Mr Hargreaves: Yes. The ideal person joining the Foreign Office Press Office is somebody who has a combination of good knowledge of the Foreign Office by having done a number of postings in the Office combined with some hands-on experience of doing communications work, perhaps in an overseas mission working on the press side or whatever. That is the ideal balance. So long as in the team as a whole you have the balance, you can make it work.

Q391 ***Chairman:*** In the Department of Health, do you have bright, young people getting up to Assistant Secretary and beyond? Do you have them working in the press office or are they all professional press officers?
Ms Jarvis: They are mostly professional press officers. We have some fast-streamers who are policy officials and they like to do a stint in communications.

Q392 ***Chairman:*** But not in the press office?
Ms Jarvis: Yes, in the press office.

Q393 ***Chairman:*** How long do they spend there?
Ms Jarvis: Usually around six months but in fact the last one, who is in fact sitting behind me, has decided that he wants to stay.

Q394 ***Bishop of Manchester:*** We have an impression from some of the evidence given to us earlier that the level of competence in communications in the different departments was actually very varied. Since the recommendations from Phillis and maybe particularly since 2004, are there particular things that can be identified briefly from each of the three departments that have been a significant improvement in the way that you are dealing with communications?
Mr Gurr: I think that the biggest improvement I would point to is that we have moved very much away from a culture of reacting to stories and issuing press notices to one where we are looking to engage with journalists and build relationships with them, not only about individual stories but about the way that they want us to do business. Sometimes we can meet the requirements. As I said earlier, we have real practical constraints in some cases and we cannot. We have put greater emphasis, as I said before, on giving access to our people, our top decision makers, through background briefings and a lot more emphasis on dealing with the regional media as well, but not instead of national media because, if anything over the last four or five years, the demands of the national media have increased. There are more broadcast channels, more magazines, more features, books, et cetera interested in what we do. We have tried to build up our regional presence and engagement, so that we have a much stronger engagement now with, for example, regional radio and regional television, and of course the web as well. Three or four years ago, we would have had a traditional website where we put information on there and expected people to come to us to seek that information out. We still have that through the Defence website and the individual service sites but we are engaging much more now on other parts of the web. We have put information on YouTube, we engage with the internet channels that are used, we know, a lot by service personnel and ex-service personnel, so we are engaging outside our area and, rather than expecting people to come to us, we are pushing information to them. I would say that the main changes are much more pro-active efforts focused much more on delivery and on priorities, and the big priorities for us at the moment are operations obviously in Iraq and Afghanistan, personnel issues and equipment issues. That is what we are trying to explain above everything else.

Q395 ***Bishop of Manchester:*** Thank you and I think that there may be one or two things in there that colleagues later wish to take up, but may I ask Ms Jarvis to comment.
Ms Jarvis: I think that communications is really central in health and the health challenges that we face, particularly in that we are now trying to deal with lifestyle diseases and not just infectious disease, so obesity, tobacco and diabetes, and we are involved in behaviour change programmes and, in order to do those effectively, you really have to understand what it is that drives people's attitudes and what helps people to change behaviour, so that real focus on getting insight on people. I think also engaging. I talked about the Next Stage Review, the Lord Darzi Review, how we engage citizens in what is sometimes called co-creation of policy. Direct information more directly with the public—I have mentioned Netmums and Mumsnet—and we have also tried to be very creative about how we use the new digital media in our public health campaigns. We have a campaign running on Habbo at the moment, which is the largest virtual online world for teenagers, and we have been promoting our HPV vaccination to prevent cervical cancer through that. There are two others. One is local communications. We know that communications is most effective when it is felt locally or in a personal context because people trust it and believe it. Finally, I think how we have been working together with policy officials; it has almost become joint working rather than just close working and that is moving into a sphere across government as well.

Q396 ***Bishop of Manchester:*** Thank you and again I think maybe there will be things to follow up there. Mr Hargreaves?
Mr Hargreaves: Coming into all of this just four months ago, I am struck powerfully by the extent to which what was set out in the Phillis Report has been taken on board and acted on. In the Foreign Office, the evidence of that is that we do now have a fully co-ordinated communications operation which embraces not only press but internal communications, the web, public diplomacy and marketing. There is a much more limited role to play in the Foreign Office than in the Health Department, but there are examples of that, for example in consular work, helping people to prepare better for going on their trips and so on. I think that that co-ordination and strategic perspective is new; it has followed Phillis and I think can by those who were responsible for Phillis be judged to be a result of Phillis. Even the Foreign Office is trying to be more local and regional. This week, the Foreign Secretary is making a visit to South Wales as part of a series of outreach visits. Senior officials in the Foreign Office are quite regularly visiting different communities in the UK. I think this is not what has always happened in the Foreign Office. On the web front, the Foreign Office web operation is extremely ambitious. This is a 40 language operation across 240 missions; it is now all on a single web platform; it was done on time to budget—not by me but by others; I am the lucky inheritor of the good work that others have done—

and that enables us to be in a very strong position to do the kind of web-based work that you need on the one hand to provide online visa application services through UKBA or to engage in blogging and wiki-based discussion fora and we are doing all of those kinds of things. So, this is not backward.

Q397 ***Lord Maxton:*** I would love to go further down into that area. As you have been speaking, it is clear that there is a major difference between Defence, the Foreign Office and the Health Department and that is this. Basically, you are responsible for all the employees in the Ministry of Defence, what they do and what they say. You are the same with the Foreign Office. However, I do not know what the percentage is, but I would think well over 90% of employees in the Health Service are not employed by the Department of Health and the controversies that might arise come from the other part. If you take the latest one which is this issue of certain people paying to top up their drug regime, that is not a policy. It has not been done by the Department itself, it has been done by individual health authorities, has it not?
Ms Jarvis: Yes.

Q398 ***Lord Maxton:*** And that creates different problems for you.
Ms Jarvis: Yes, although we see ourselves as one. No, we do not have any direct control over staff in the NHS, so the 1.3 million people who work in the NHS are employed separately. We have 2,245 civil servants in the Department of Health and obviously we try to be co-ordinated, but there will be a number of stories this morning where our line will be that it is entirely a matter for the PCT involved. I can think of two particular stories; the one that you have mentioned is also part of that. A great deal of what we try and do is having good co-ordination, making sure that we are sharing information, making sure that there is a kind of "no surprises" rule but, certainly not just in communications terms but in the management of the NHS, the principle has been about devolution and that local organisations are the people who are best placed to understand the needs and wants of their community and priorities and therefore they design services accordingly.

Q399 ***Lord Maxton:*** If you produce a leaflet on obesity, a GP has no direct obligation to have that on display and on a hand-out basis within his surgery or can you instruct them?
Ms Jarvis: No, we cannot instruct them.

Q400 ***Lord Maxton:*** I think that makes a big difference between you.
Ms Jarvis: Yes, exactly and that is why you have serving officers and diplomats in the press office. We do not have any who we directly employ, so ours are professional communicators but we try to use doctors/clinicians to present issues and policies wherever possible.

Q401 ***Chairman:*** But it has always been thus.
Ms Jarvis: Yes.

Q402 ***Chairman:*** It has never prevented, from my bit of experience, Government Ministers being blamed for anything which takes place around the country.
Ms Jarvis: That is entirely true and ultimately they are accountable too.

Q403 ***Lord Grocott:*** Could you send us a paper on this issue giving us an idea of the scale involved? I think that would be very helpful, because I think that it is important for us all to understand the scale of the demand that you are trying to accommodate. I would be very interested to know the number of requests you get during the year from whatever source—the numbers that come from journalists, obviously, but I also understand that there is a massive increase in communication from the public by letter or phone call; the demands that came clearly in relation to 24-hour media, which has had a massive increase in demand as I understand it; the demands that come through web-based work and all of that sort; and the demands that come from the implementation of the Freedom of Information legislation. I imagine, though perhaps you can help us on this, a very large proportion of those requests will be requests from the media as opposed to requests from the public. If you could send us a paper giving us an idea of the scale, I think that would be very helpful. My reason for asking that—and this is not a criticism of you, it is a sense of empathy really—is that I get the sense of operating the system where the water is just barely beneath the nose all the time. These unremitting requests are coming in—they have grown certainly through the web and simply through the public knowing that they have more access to politicians, Ministers and to everyone else. I wonder whether there comes a point at which you say, "Look, we can't keep going on expanding and expanding and developing in order to meet all this. It is just not deliverable. We cannot go any further". One specific example is that it always mildly amuses me that it is now normal that broadcast radio, for example, will quite frequently say at 6.30 a.m., particularly on health matters, "We asked for a Minister but none was put up", accusatory almost in tone, and likewise at 11.30 or 11.15 p.m. when *Newsnight* does it, again, "We asked for a Minister . . ." as though it is the job of all Government Departments and all Ministers and all officials at all times and in all places to be available to do that rather than doing the job. I would like some sense of the scale of that.

Ms Jarvis: I would like to make a couple of quick comments. I know for example that we have 1,000 calls through our media centre every week, and we have 120 FOI requests every year. You are right: it would require a paradigm shift in a way because the more information out there and the more desire there is for more information, actually the more there is a need for having trusted voices and trusted brands who can help interpret that. In the NHS for example, the NHS Choices website is almost becoming an accredited source whereby people can come to the doctor with so much information that they really need people to be able to take them through it. So, while there is so much information out there, it is even more important that we are in the place where we can help people work out what all that information means.

Lord Grocott: However, still inevitably the impression is given that if a journalist, particularly like a prominent journalist, rings up the Department and says, "I need an answer to this within the next 30 seconds", that is the one extreme. If, at the other extreme, someone writes from the Midlands or the North because they have not had their hip operation, which I know is not your direct and immediate responsibility, in my judgment that person has equal entitlement to a reply to that of the important journalist. I think I am right in assuming that it is the important journalist who would get preference in the case being dealt with. That is not a criticism, it is more an observation.

Q404 ***Baroness Eccles of Moulton:*** Could we now return to the relationship between civil servants and special advisers? This has been touched on already in the discussion so far. We have heard more about it from Ms Jarvis, who has told us that there is a weekly meeting which the Secretary of State's Private Office attends, and the special advisers, and that you have two, and it sounds as if it all works pretty well. Mr Hargreaves has briefly referred to the relationship by saying that the Civil Service code governs, but maybe we could hear a little more from the FCO about that, and I do not know that we have had very much so far from the Ministry of Defence regarding the relationship between the two. Perhaps we could start with the FCO, move on to the MoD and then, if there was anything that the Department of Health would like to add, although we have already heard quite a bit about it, and take it in that order, please.

Mr Hargreaves: Let me begin for the FCO. The facts are that, in the Foreign Office, there are two[1] special advisers who job share. We have already discussed the scale of the communications operation that is going on in the Foreign Office, which is vast, and, as Lord Grocott says, is not likely to get less vast, and is something which is a very complicated and large thing to manage. So, it would be unwise to overstate the scale of the special advisory role within the context of that overall communications operation. How does it work in practice? On most issues, it is absolutely clear: special advisers deal with the political activities of the Minister; nobody is any doubt about that; there is a firm line there. In terms of working together so that we do not fall over each other and schedule events and activities at times that do not make sense, like Sian, I work and my colleagues in the Foreign Office press team work to ensure that we are well co-ordinated with the special advisers. Really, I think that there is a great deal of mystique about all of this which deserves to be dispelled. No doubt the role of the press officer and the role of the special adviser can be done well or badly but it is pretty clear what the difference is. You can have a debate about the numbers of them. The numbers in the Foreign Office do not seem to me to be excessive as an observation.

Q405 ***Baroness Eccles of Moulton:*** So, there are not really any tensions within your Department between those two groups of people? The impression that has been given generally to the public, maybe not connected with either the FCO or the MoD, is that increasingly over the last few years there has been an encroachment on the Civil Service role by the special advisers who have been playing too much part in what should be reserved for the press officers, but maybe this is simply not the case.

Mr Hargreaves: Before joining the Foreign Office, I, like others in the room probably, enjoyed *The Thick of It*. The Foreign Office is not like that.

Q406 ***Baroness Eccles of Moulton:*** And the MoD?

Mr Gurr: We too have two special advisers in the Ministry of Defence. We do engage with them on major announcements. I think it is important that they contribute to the discussion on those issues. They have a responsibility for ensuring that the party political aspects are properly managed and taken into account. I have a responsibility for making sure that departmental aspects are properly looked after and, like my colleagues, I have never felt any tension or pressure or problems in terms of the relationship. I have always been very clear, as have they to be fair to them, as to where the lines are drawn. What I think is important to understand is that both they and I, if you like, and all of us in Defence have a shared interest in the reputation of Defence in the armed forces. They want it to be maximised for their reasons, and I want it to be maximised for mine. So, there is as much commonality in what we are doing as there is tension. I know that it does not necessarily always look like that when you are looking from the

[1] In the recent ministerial re-shuffle, the new Minister for Europe brought with her a special adviser, taking the numbers from two to three, of which two jobs are part-time.

outside in, but I have never found it a difficulty or a problem.

Q407 ***Baroness Eccles of Moulton:*** You find it an entirely positive relationship and, if there were not specialist advisers in your Department, that would be a loss?
Mr Gurr: I think that it would, yes.

Q408 ***Baroness Eccles of Moulton:*** Is there anything that you would like to add to what you have already told us, Ms Jarvis?
Ms Jarvis: No. I think that I probably became caught up on the word "defend". I have asked for the specific wording of the code and that was probably the wrong word to use. We do have a duty to promote policies and to explain policies, and we also have to carry the ministerial line. I think for shorthand I probably got into a bit of trouble there.

Q409 ***Chairman:*** Perhaps you revealed your attitude.
Ms Jarvis: No, I did not reveal my attitude. I could have chosen a better word to use.

Q410 ***Lord King of Bridgwater:*** My memory going right back is that when special advisers started, they were actually special advisers and some of those who were brought in were particularly learned on particular subjects and were thought to be useful to the Department and to Ministers. Gradually—and this certainly started in the Conservative Government—they then became a little more political and then some of them just turned into PR spokesmen for their Minister. Do you see that trend? Do you see that as part of their role?
Mr Gurr: I think that some of them do take a very close interest in the way that the media operate. It seems to me that that is not surprising given the world we live in now and the amount of interest that there is certainly in what we do in Defence and I am sure in the other departments as well. Whether or not that is more the case than it was before, your experience clearly is much greater and longer standing than mine, but I seem to recall that they always took a close interest in presentational issues during the time that I have dealt with them. Some of them have a particular interest in the media because some of them do have media backgrounds and we have had examples of this in the past where an individual has come into a special adviser role having worked in broadcasting or the media and clearly that is an area in which they then take a particularly focused interest.

Q411 ***Lord King of Bridgwater:*** Funnily enough, Howell James, who was one of the first to come in, had that sort of PR background and worked very closely with David Young at that time. Actually, the interesting thing is that I think Francis Maude, who was dealing with the Cabinet Office, said that the numbers had trebled since 1996/97. In the old days, it used to be just Secretaries of State who might have had a special adviser in his office attached really to the Private Office who had a perfectly legitimate role and I think that the Department found it an asset because you could make sure that you were plugged into what the likely party-political issues were and whether the propositions put up were likely to be chucked out by a Minister on party-political ground. Now, if the numbers have trebled, do lots of other Ministers, more junior Ministers, also have special advisers?
Mr Gurr: In Defence, we have just the two, as I said, and they are both part of the Secretary of State's Private Office.

Q412 ***Lord King of Bridgwater:*** What about the Foreign Office?
Mr Hargreaves: No.

Q413 ***Lord King of Bridgwater:*** Health?
Ms Jarvis: We do not have special advisers.

Q414 ***Lord King of Bridgwater:*** How many?
Ms Jarvis: Two.

Q415 ***Lord King of Bridgwater:*** And they are in the Secretary of State's Office?
Ms Jarvis: Yes.
Lord King of Bridgwater: I wonder where all the others have gone then!
Chairman: We will find out!

Q416 ***Lord Maxton:*** Just to make it quite clear, one of the key roles of the special adviser is political. They are the link to the party. The party is an organisation that gets the Government elected and therefore they have a responsibility to tell the Minister, having spoken to you presumably and other civil servants, "This is what the party will think about this", and that is one of their key roles, is it not?
Ms Jarvis: Yes.
Chairman: Lord King raises an interesting question, because, according to the Cabinet Office, there were 74 special advisers in Government but only six in these three massive departments. So, we will have to dig and find out where all the others are stored.

Q417 ***Lord Inglewood:*** I would like to move on to something a little different—and I should declare an interest as chairman of a regional newspaper group—and talk about regional communications. When Phillis reported, he stated that he felt that much could be done to improve the relevance and appeal of communication from Government to the different communities in the country. You probably will not

have seen but the evidence that we received last week from three representatives from what I might call the regional media was pretty excoriating about the quality and relevance of much of the information that they receive. I am not going to ask you to comment on that now because I do not think it is appropriate. The two questions I would like to put are, first of all, what changes have you been making to your regional activities, and, secondly, are you satisfied with what is currently happening, and, if not, what particular ideas do you have about improving it?

Mr Gurr: Perhaps I can begin. We have had a Defence presence across the regions for many years, individual brigades and commands and other defence organisations have often had a press office or somebody who deals with local media. What we did a few years ago was to try and ensure that that was more co-ordinated and coherent and we established a number of defence regional press officers. What we have done over the last year is what we call "upgun". We have improved and enhanced that structure and we now have a structure across the country of eight regional press officers; they are out there in the regions or in Wales and Scotland, and their job is twofold: it is to deal with the regional media across the whole range—broadcast, press, local and regional—on major defence issues, but it is also to try and get a bit more coherence in all of the other Defence activity that goes on in those individual regions. We have made a considerable investment in this, as I have said, over the last year. Why have we done that? One of the reasons why we have done it is because it is clear to us that there is a big appetite for information about Defence out in the regions through the regional media, albeit from a different direction than you might get from the national media. The regional media are obviously very interested in the units who come from their particular part of the country, the people from their part of the country and the jobs that are created in their areas of the country by Defence activity. So, we have put a lot of effort into this. It has led to a significant increase in the number of stories that are getting into the regional media; the figures that have been given to me suggest that there has been an increase of about 100%.

Q418 ***Lord Inglewood:*** Over what period?

Mr Gurr: Over the period since this new process was established back in September last year. But it is still new, and it is still in the process of finding its feet in terms of binding together all the Defence activity that is out there. So, it is something that we are putting more effort into and certainly recognise the importance of it. I think that it has proved its worth on things like home-coming parades for units coming back from operational theatres. The way we dealt with the media on those could be a little sporadic at times in the past. Some people found out about them, some did not; it was sometimes at the last minute and all that sort of thing. We have a much more systematic approach to that type of thing now and I think that it is bearing fruit.

Q419 ***Chairman:*** Do you have more or less the same reply?

Ms Jarvis: Yes. We have to work with our NHS communicators to get the messages out, but we are very committed at a regional level because we know that those messages are better: people trust local and regional papers, and so we, wherever possible, try to tailor stories. If it is a national story, we try to tailor a package of stories for the regions, whether it is making sure that we have good case studies from their particular area or good quotes from local people or local stakeholders, and also making sure that we regionalise facts and stats so that they have a good angle for their particular story.

Q420 ***Bishop of Manchester:*** This is the area taking up in a little way the public relation side of things and I just want to clarify, so that we really do have it on record, if any of your departments deploy any external PR companies to assist you in your media work and, if that is the case, how many are employed and at what cost to the taxpayer. That may require some written evidence coming in if the answer to the initial question is "yes".

Ms Jarvis: I do have some figures for you. For 2006/07—for 2007/08 we are going to give you the updated figures—as we have run all these public health campaigns around obesity and we need to have PR support to get the messages out and also to engage with stakeholders, we spent £1.85 million on six particular PR agencies.

Q421 ***Bishop of Manchester:*** Are you happy that those people obviously are covered by the code of neutrality that the Civil Service normally would have?

Ms Jarvis: Yes, we are.

Q422 ***Bishop of Manchester:*** That is not a problem?

Ms Jarvis: They tend not to be in very contentious areas but, yes, the code is explained to them and they are managed properly by COI usually in our case, but they are usually working in very non-contentious areas. We would not have them doing ministerial announcements for example. They would be perhaps doing some of the work that we are doing around HPV virus for example.

Q423 ***Bishop of Manchester:*** Just before I turn to your colleagues, may I remind you that you very kindly suggested that you would give us some written

information about the flu pandemic in terms of its budget and the kind of strategy that you have developed for communications, both to different departments of Government and to the public, because my guess is that that is the big one on the horizon for your Department. May I turn to Mr Gurr and ask you about public relations companies.
Mr Gurr: My organisation does spend a little bit generally in support of major events that we organise such as the Territorial Army 100 celebrations and the 90th Anniversary of the Royal Air Force. I can certainly let the Committee have a note on precise spend. The recruiting organisations spend rather more and they have marketing budgets which are substantially greater. Again, I can include those in a note.
Chairman: That would be very useful.

Q424 ***Bishop of Manchester:*** It does not worry you about the non-observance of the code of neutrality by requirement of people—?
Mr Gurr: I have never had any reason for concern on that.

Q425 ***Bishop of Manchester:*** And Mr Hargreaves?
Mr Hargreaves: We are lighter users of agencies of this kind than the very individual public facing operation like Sian's Department. An example, however, where we do is in the consular know before you go, get your insurance, be prepared campaign, which is a long-running campaign. That spends about £700,000 a year in support of one kind or another. I simply make one other point which is that, in getting the balance right between the right culture inside the organisation and the right availability of external expertise, I think that it is very easy to knock the idea of using PR agencies or marketing agencies or whatever but they do, well chosen and well managed, make an absolutely invaluable contribution to a lot of the Government's work and, in the area of diplomacy, which is obviously my concern, the days when deals were cut primarily by diplomats in private circumstances have been much altered by the open media atmosphere in which we operate and therefore we do need, as a Foreign Office, to be influencing the context of debate around for example climate change globally, and to do that requires very significant skills and resource and some of those resources are best purchased externally.

Q426 ***Bishop of Manchester:*** And it does not worry you that they are not covered by the code of neutrality?
Mr Hargreaves: They are in effect covered by it because they work for us or in some cases, as Sian said, through the COI. Those controls are very much in place. The key art actually is in being a good client and knowing how to get the most out of the service that you are buying and that is a problem that faces Government, business and anybody else who buys such services.

Q427 ***Lord Maxton:*** Mr Gurr, do you have any specific problems, coming back to the regional point in a sense, except that I am dealing with the national point of Scotland, in Scotland, because of course the political atmosphere, the administration in Scotland, is very largely opposed to a large amount of the defence policy of the British Government? Does that cause you specific problems when dealing with the Scottish press in terms of keeping your neutrality for a start?
Mr Gurr: No, it does not. There is greater interest often in the Scottish media, and sometimes they will take a close interest in stories that are just not picked up in the national media south of the border, but, in terms of maintaining neutrality, there is never a difficulty. We have the lines that come out of the departmental officials and those are the lines that we use. We have found that we have had to work extremely hard in Scotland in particular because there is a huge range of Defence activity up there and a huge amount of interest in what we do, everything obviously from the familiar nuclear issues around Faslane to Scottish units on deployment to Iraq and Afghanistan. There is a huge appetite up there. What I would say is that we see that as an opportunity really. It is good that there is that degree of interest up there because we find it more fertile ground to engage. In terms of neutrality, it has never been a problem.
Lord Inglewood: In my earlier remark, I mentioned the criticism that had been levied at central Government communications in respect of region coverage and I was wondering whether, once the evidence is available, if you have any comments, you would let us have them, please, in writing as it seems only fair.
Chairman: I think that we have given you quite a lot of things to come back on and apologies for that in a sense, but this area is so important and it is so important to understand all its current wide variety and range. Thank you very much, indeed. We have kept you far beyond what you have a right to actually expect, you have been very patient, and I would like to thank you very much for coming.

Supplementary letter from the Department of Health

I write in response to my recent appearance before the Lords Communications Committee. I agreed to provide answers to a number of supplementary questions that you and your colleagues posed on the communication activities at the Department of Health.

I do hope that the information below provides you with the information you need.

I would also like to correct an error I made during my evidence and apologise for doing so. You asked me about Tony Collins being refused entry to a press briefing. I said that I was on maternity leave at the time, which in fact was not the case. I apologise for this error.

ENQUIRY STATISTICS

Lord Grocott asked me to supply information about the increase in the number of enquiries made to the department either from journalists via our press office, or from the public via freedom of information requests, calls to our public enquiry line or via our websites.

In terms of visits to our website, the table below shows both the number of individuals who have accessed the departments own website (URL: www.dh.gov.uk) and the total number of times the site has been accessed.

www.dh.gov.uk	*Unique visitors*
February 2004 to December 2004	7,199,130
January 2005 to December 2005	10,457,960
January 2006 to December 2006	11,333,314
January 2007 to December 2007	10,634,788
2008 *To September*	*7,481,054*

Unique Visitors means visitors who download pages from a website during a specified timescale, in this case, one month. A unique visitor is only counted once within the specified timescale.

You may also be interested to note that the NHS website, NHS Choices (URL: www.NHS.uk) is currently the most used health information website in the UK. The site has recently incorporated the website of NHS direct and has since received over 1 million visits per week.

www.NHS.uk	*Unique visitors*
January 2007 to December 2007	10,634,009
January 2008 to August 2008	11,434,982
January 2008 to September 2008	13,217,888

The Freedom of Information Act fully came into force in 2005, since then we have received the following number of requests under the Act:

Year	*Number of FoI requests*
2005	1,203
2006	1,450
2007	1,287
2008 *To date*	*1,020*

Currently, 91% of all FoIs are answered within the 21 day target.

The department's customer service centre sits within Finance and Operations Directorate rather than within my directorate and deals with all enquiries from the public other than the media. The public can contact us via the public enquiries telephone line, via email and the departmental website or by writing, or asking their MP to write to ministers.

The table below shows the number of enquiries the centre has dealt with over the previous five years:

Telephone calls to our Enquiry Line	
2004	102,196
2005	110,132
2006	162,170
2007	138,285
2008 *(to date)*	*99,347*
Emails to our Service Centre	
2004	23,116
2005	19,209
2006	23,901
2007	23,485
2008 *(to date)*	*18,783*
Letters to Ministers from members of the public	
2004	21,407
2005	39,167
2006	46,053
2007	24,880
2008 *(to date)*	*25,296*

Journalists who wish to contact the department, have, since 2007, had a dedicated Newsdesk telephone system which allows them to contact a press officer from 8.00 am to 7.00 pm, five days a week. Outside of those core hours an out of hours duty press office service operates. The desk is extremely busy and on average the Newsdesk team of nine staff handle 5,158 calls a month (giving a weekly average of 1,290 and a daily average per press officer of 29 calls).

Data on the number of calls by journalists to press offices is held by the Department for 12–14 months. This means we are unable to provide information centrally on incoming calls for the last 10 years.

The following table shows the total number of calls received by press officers in the Media Centre, broken down by month, for the period October 2007 to October 2008.

PRESS OFFICE CALLS RECEIVED 2007–08

	Newsdesk 9 staff	*Specialist desks 21 staff*	*Press Office Total*
October 2007	6,288	5,601	11,889
November 2007	5,958	5,709	11,667
December 2007	4,139	4,047	8,186
January 2008	5,812	5,476	11,288
February 2008	4,969	4,964	9,933
March 2008	4,395	4,202	8,597
April 2008	4,527	4,269	8,796
May 2008	5,235	4,953	10,188
June 2008	6,365	6,060	12,425
July 2008	5,218	5,087	10,305
August 2008	4,042	2,632	6,674
September 2008	4,868	3,810	8,678
October 2008	5,234	5,368	10,602
Average/Month	5,158	4,783	9,941

However, we have very limited data on the number of calls to the press office in one previous year which was collected in 2007 as part of the business proposal to establish a newsdesk. It is provided alongside the 2008 data for each month between April and October.

PRESS OFFICE CALLS RECEIVED 2006
AND 2008 COMPARISON

	2006	*2008*
April	11,905	8,796
May	16,981	10,188
June	14,092	12,425
July	13,211	10,305
August	10,730	6,674
September	8,633	8,678
October	13,105	10,602

We believe, the fall in the number of phone calls taken per month in 2008 compared with 2006 to be the result of calls being dealt with more efficiently following the establishment of the Newsdesk in 2007, leading to less repeat and duplicate calls from journalists to different press desks. The Newsdesk now handles most telephone calls from journalists on running or breaking news stories.

We also believe it is likely that the improved website and the service it offers to journalists may account for this fall in calls to the press office.

Pandemic Flu Communications

The Bishop of Manchester asked me to supply information related to the budgets in place to manage the communications related activity required in the event of a flu pandemic.

Experts say an influenza pandemic—or global epidemic—is likely but cannot predict when it will happen. A pandemic flu strain could infect billions of people worldwide, so Governments are making preparations to limit the impact.

The National Pandemic Flu Framework outlines the UK's response to a pandemic and its strategy on preparedness. The Framework and the accompanying communications strategy uses the World Health Organisation (WHO) pandemic stages as their structure.

The current alert phase is Phase 3.

WHO level	*Phase*
1	No new influenza virus subtypes detected in humans.
2	Animal influenza virus subtype poses substantial risk
3	Rare human cases, no human to human transfer.
4	Small outbreaks, limited human to human transfer (world wide but not UK)
5	Larger Outbreaks human to human transfer established (world wide but not UK)
6	Pandemic confirmed
	6.1 UK alert level 1 no cases in the UK
	6.2 UK alert level 2 virus isolated in the UK
	6.3 UK alert level 3 outbreak(s) in the UK
	6.4 UK alert level 4 widespread activity in the UK

During any period of increased alert and throughout the response phase (WHO Phases 5 and 6) the objectives are to promote and reinforce individual and collective actions, particularly around respiratory and hand hygiene, that reduce the spread of influenza and minimise its health and wider impact on the UK.

The role for communications will inevitably change according to how imminent a pandemic is. The key challenge for the communications strategy is to find the most efficient and reliable way of delivering this information to the general public to ensure widespread understanding of the situation and drive appropriate behaviour changes without stimulating widespread panic—in other words, to deliver "measured engagement".

The communications budget for 2008–09 is £3.5 million, which includes the preparation of materials to be used at later WHO pandemic alert phases, and a small scale campaign running imminently "Catch it, Bin it, Kill it" aimed at improving respiratory health and hand hygiene.

There is a substantial budget to be drawn down to cover additional costs in the event of the WHO announcing an escalation of alert level.

The OGC Gateway Review of the Pandemic Influenza Preparedness Programme was carried out 28 July 2008 to 31 July 2008. The reviewers marked out communications planning as one of the areas of the programme that was exemplary and worthy of sharing more widely.

Communications Budgets

For the financial year 2007–08: The total budget allocated to the communications division to cover its operation and work was

£52,203,620.

This amount is made up of:

Administration spend, including staff costs and the day-to-day operation of the directorate

£7,100,437

Programme costs—the cost of the work undertaken by the directorate, including all promotional, campaign activity, and public health communications.

£45,103,183

Programme costs includes spending on the following public health campaigns:

Obesity	**£1 million**
Alcohol	**£4.5 million**

This funding was provided jointly by the Department of Health and the Home Office.

Tobacco	**£27.7 million**
Sexual health	**£3.56 million**
Substance abuse (FRANK drugs campaign)	**£2 million (DH contribution)**

For the financial year 2008–09: The total budget allocated to the communications division to cover its operation and work was

£ 107,193,900

This amount is made up of:

Administration spend, including staff costs and the day to day operation of the directorate

£7,568,900

Programme costs—the cost of the work undertaken by the directorate, including all promotional, campaign activity, and public health communications.

£99,625,000

There are two key reasons for this increase in programme costs, principally the introduction of obesity into our behaviour change portfolio with substantial marketing funds behind it, reflecting the importance of tackling this issue, and a significant increase on expenditure against tobacco control.

Obesity is the biggest public health challenge the country faces, it already costs the NHS £4.2 billion and the economy £16 billion per year. A failure to address the issue now we will condemn our children to reduced life expectancy and cost the NHS and the nation many billions of pounds. The Foresight report predicted that by 2050 if the increasing trend in obesity continues unchecked the cost to the UK will be £50 billion.

That is why we are aiming to create a lifestyle revolution that will help families to eat well, move more and live longer, bringing in contributions from grassroots community clubs to multinational companies to join us.

We have also instigated a new three-year tobacco control marketing communications strategy beginning in 2008, because of the proven effectiveness of our marketing campaigns.

Programme costs include spending on the following public health campaigns:

Obesity (including Change4life)	**£24.2 million**
Tobacco	**£43 million**
Stroke	**£6 million**
Alcohol	**£6 million**
Sexual health	**£5.2 million**
Substance Abuse (FRANK drug campaign)	**£2.3 million (DH contribution)**

Communications Staff Grades

Lord Grocott asked me to supply details of the grades of all staff reporting to me, these are listed below.

COMMUNICATIONS STAFF NUMBERS AND GRADES

	Total
AO	2
EO	11
HEO	33
SEO	31
Grade 7	27
Grade 6	11
SCS	7
Total	122

I do hope that this provides all of the information you requested. If it does not, or if there is more information you require in order to fully complete your investigation please do not hesitate to contact me.

May I also thank you for the opportunity to come and give evidence to the committee. My department operates one of the busiest press offices and communications functions in government and my staff work tirelessly to communicate, actively and effectively, with the public, patients, NHS staff and stakeholders and the media.

My Newsdesk alone takes over 1000 calls per week and on any given day is dealing with upwards of 20 stories. Press officers frequently handle complex enquiries from journalists often responding to extremely short deadlines. I think it is important that I should stress to the committee that our fundamental principle is to give journalists as much information as we possibly can as clearly and efficiently as possible.

However, as the Phillis enquiry concluded, we no longer live in an age where the established press is the sole medium for communicating with the public—newspaper circulations are going down and fewer people watch or listen to the news. It is for this reason that I recognise that we must also build compelling communications strategies, based on high quality insight, if we are going to succeed in changing the way individuals behave towards their health and in tackling the health challenges we as a society face.

I think the fact that trust in the NHS as an organisation is at its highest level since 2000, and the recent announcements that 13% more people quit smoking last year demonstrate that our work is having a positive impact on tackling these challenges successfully.

I look forward to reading the conclusions of your investigation with great interest.

Again, if I can be of any further assistance, please do not hesitate to contact me.

28 November 2008

Supplementary memorandum by the Foreign and Commonwealth Office

It is only possible to make a rough estimate of the number of people working in communications across the FCO global network because all Heads of Mission, and, in a sense, all diplomats and many of our local staff are professional communicators. The FCO has 16,000 staff in total. It is also the case that the FCO has traditionally deployed diplomats into specialist communications roles, though there is increasingly a trend in favour of hiring locally communications specialists for certain roles.

An internal FCO evaluation in 2008 estimated the number of people engaged in communications around the world at around 390, using 2006–7 data. Given that there are roughly 250 overseas missions, some of which have no full time dedicated communications staff, others of which have a team, this is probably a fair judgment.These numbers are in addition to the roughly 100 staff employed directly in London on communications-related activities. The responsibilities of the London team include: press office, all web-related work, internal communications, stakeholder relations, events, publications and public diplomacy (including managing the FCO relationship with British Council, BBC World Service, Wilton Park, British Satellite News and the FCO's scholarship programmes).

14 November 2008

Supplementary memorandum by the Ministry of Defence

Q403—*What are the numbers of visits and hits to the MOD websites?*

The most recent information we have regarding website statistics is as follows:

			2007–08	
Website	*URL*	*Page Views*	*Visits*	*Unique Visitors*
MOD Corporate website	www.mod.uk	25,879,449	6,875,139	4,336,104
Royal Navy	www.royal-navy.mod.uk	39,856,043	4,800,481	4,369,726
British Army	www.army.mod.uk	71,028,217	21,053,139	8,472,991
Royal Air Force	www.raf.mod.uk	56,607,751	9,893,569	6,216,030

These figures are for the financial year 1 April 2007 to 31 March 2008.

Q403—*How many Media enquiries does the central press office receive? How many FOI requests are received by the MOD per annum? How many of these are from the Press? How many general enquiries are received?*

Media Enquiries

The MoD central press office receives between 200–500 calls a day and on average work on 12 national and 12 regional stories daily.

Non-FOI Public Enquiries

Queries from the public are received by the MOD website on a regular basis, those that are not classed as FOI requests are displayed beneath:

Business as Usual—1,760
Genealogical (family history enquiries)—264
Subject Access requests—96

Overall FOI Numbers and Appeals

The MOD receives a significant number of FOI requests, details as below:

Year	*Number of MOD FOI Requests*	*Resolvable Requests**	*Fully Answered*	*Partially Answered*	*Information Refused (includes for cost purposes)*	*Information being Processed at Year-End*	*Public request for Internal Review*	*Appeals against Internal Reviews to the Information Commissioner's Office*	
2005	4,604	4,094	71%	10%	16%	3%	2%	6	0.13%
2006	3,300	2,784	73%	11%	12%	4%	2%	18	0.55%
2007	3,026	2,618	73%	9%	13%	5%	3%	12	0.40%

*"Resolvable requests" are those where it is possible to make a substantive decision on whether to release the requested information. They exclude requests which are lapsed or "on-hold", where the information was not held, and where it was necessary to provide advice and assistance, ie it would not have been possible to resolve the request in the form it was asked.

Data is taken from Freedom of Information Act 2000 Third Annual Report on the Operation of the FOI Act in Central Government 2007.

FOI from Media

A number of FOI requests are received from the media, however these can only be identified where the individual making the request declares who they are/where they work or if their contact details reveal the place of employment (eg johnsmith@thetimes.co.uk). 1 January 2007 to 10 October 2008 we received 944 FOI requests which were identifiably from media sources, there may have been more overall.

Q423—*How much is spent per annum on using agencies/external PR companies including for recruitment?*

It is not possible to accurately compile every item of PR expenditure across the Department as Brigades, regiments or local civilian teams may use PR agencies which are locally contracted or where expenditure is accounted for under wider programme expenditure. As such these figures would not be held centrally.

What is shown beneath is the major spend from the three services and the MOD central Media and Communications organisation. It represents spend on national and/or centrally organised campaigns/events including Armed Forces Recruitment campaigns.

Contracts are placed either via existing Central Office of Information (COI) arrangements or are directly contracted by the MOD.

Expenditure for Financial Year 2007–08 (1 April 2007 to 31 March 2008) that has been reported to us is as follows (all figures are excluding VAT):

Unit	*Via COI (£M)*	*Directly Contracted (£M)*	*Total (£M)*
Army	18.9	5.415	24.315
Royal Navy	5.5	0.851	6.351
RAF	13.257	0.491	13.748
DGMC	0.120	0.243	0.363

November 2008

Supplementary memorandum by the Ministry of Defence

ADDITIONAL QUESTIONS

Q. *What is the breakdown of grades of communication staff managed by Nick Gurr?*

Nick Gurr as of October 2008 had direct responsibility for 184 individuals working within DGMC (Director General Media & Communications). These individuals will include communications staff, support personnel, temporary postings, media trainers, graphic designers and photographers. The break down of grades is as follows:

SCS ML2	1
SCS ML1	2
B1/Grade 6	1
B2/Grade 7	17
C1/SEO	22
C2/HEO	36
D/EO	14
E1/AO	18
E2/AA	1
Commodore	1
Captain RN	1
Colonel	3
Group Captain	1
Commander	2
Lieutenant Colonel	8
Wing Commander	3
Lieutenant Commander	6
Major	8
Squadron Leader	7
Captain	4
Lieutenant (RN)	1
Flight Lieutenant	3
Warrant Officer 2nd Class	1
Sergeant	4
Chief Petty Officer	2
Staff Sergeant	1
Petty Officer	3
Leading Hand	3
Corporal	7
Lance Corporal	1
Senior Aircraftsman	2
Grand Total	184

Exact numbers and grade split of the organisation will alter regularly as people join and leave.

Q. *What is the breakdown of communications costs and budgets within MoD?*

We are only able to provide exact figures for Director General Media & Communications (DGMC) as we have no central read of other Departmental or Service budgets. These costs are as follow for DGMC over the last three financial years:

DGMC HISTORICAL EXPENDITURE (NET OF OPS)

Commodity £M	*2005–06*	*2006–07*	*2007–08*
Service Pay & Allowances	5.160	5.676	5.228
Civilian Pay & Allowances	4.889	4.709	5.123
Personnel	**10.049**	**10.385**	**10.351**
Property Management Minor Works	0.044	0.011	0.047
IT & Comms	0.606	0.408	0.975
Other Infrastructure Costs	0.011	0.028	0.006
Infrastructure Costs	**0.661**	**0.447**	**1.028**
Stock Consumed	0.046	0.043	0.050
Food/Clothing	0.007	0.005	0.003
Fuel	0.022	0.038	0.027
Other Materiel Consumed	0.129	0.165	0.126
Stock/Other Consumption	**0.204**	**0.251**	**0.206**
Equipment Support Costs	**0.046**	**0.005**	**0.076**
Transportation & Movement	0.751	0.803	0.686
Fees for other Professional Services	0.076	0.117	0.358
External Education and Training	0.042	0.167	0.157
Other Costs and Services (inc Programme Costs)	3.818	2.908	2.912
Other Costs—RDEL Direct	**4.687**	**3.995**	**4.113**
Income	−0.179	−0.160	−0.189
Receipts and Other Income	**−0.179**	**−0.160**	**−0.189**
TOTAL OCS DIRECT RESOURCE DEL	**15.468**	**14.923**	**15.585**

Complete figures for spend across the department are not available; however, we believe the expenditure to be approximately £30 million a year (excluding recruitment expenditure and manpower).

The figures previously provided for PR consultancy spend include expenditure on recruitment and as such would not fall into the £30 million estimate.

Memorandum by Citizens Advice

Introduction

1. Citizens Advice welcomes the opportunity to submit evidence to the Lords Committee on Communications in its inquiry into government communications. Our evidence addresses a number of areas within the terms of reference of the inquiry, particularly the ease with which citizens can find specific government information about entitlements and services. Our evidence covers the following areas:

(a) the extent of the role of the Citizens Advice service in England and Wales in providing information and advice to the public about government services;

(b) an overview of our services, the types of problems we deal with and the characteristics of our service users;

(c) written information from government available in printed and web based formats;

(d) developments in government helplines;

(e) suggestions for possible improvements in government information production from our perspective; and

(f) general comments on the effectiveness of government communications for citizens and areas we would like to see improved.

We have significant engagement with government in responding to consultation exercises and would be happy to provide the Committee with further evidence on our experiences of consultation and engagement of the public in policy formation.

The Role of the Citizens Advice Service

2. The Citizens Advice service is a charity which provides free, confidential information and advice to everybody on their rights and responsibilities regardless of race, gender, disability, sexual orientation, age or nationality. A network of 426 Citizens Advice Bureaux give advice from more than 3,200 outlets in England, Wales and Northern Ireland including high street offices and outreach sessions in GP surgeries, colleges, workplaces and community centres, in clients' homes, on the phone and by email. Over, 6,000 paid staff and more than 20,000 trained volunteers deliver advice to help clients deal with 5.5 million new problems a year, on issues such as debt, benefits, housing, employment and consumer matters. CAB advisers can help fill out forms, write letters, negotiate with creditors and represent clients at court or tribunal. To back up this local service Citizens Advice produces and maintains a public information website called www.adviceguide.org.uk which currently has 7.3 million visitors a year using information on 9.4 million problems.

3. In 2007–08 local Citizens Advice Bureaux helped 1.9 million people to solve 5.5 million new problems. Service users come from a variety of backgrounds, though face-to-face users are most likely to be within the C2DE social classes, have a long term illness or live in social housing. In a year 15% of all people in groups DE use a CAB, 19% of all disabled people do so. And 70% of our debt clients are tenants.

4. Public awareness of the service is very high. According to a BMRB poll taken in August 2008, 96% of people have heard of the Citizens Advice service and 42% say they have used a Citizens Advice Bureau (CAB) at some point in their lives. Over 80% of the public would consider going to a CAB in the next 12 months if they needed information or advice on an issue we could help them with. Whilst many of our clients come to us because they feel they have nowhere else to turn or don't know where to start, many are also signposted to us by government and public and private sector service providers. For example, leaflets and letters about where to get advice on debt produced by the banking and credit sectors and the Financial Services Authority all refer to Citizens Advice Bureaux as do many other publications.

Types of Problems Dealt with by the Citizens Advice Service

5. Many of the problems we deal with concern government services—particularly welfare benefits and tax credits, which totaled 1.5 million issues brought to local bureaux last year and account for over 27% of all new problems handled by bureaux last year. 2.5 million of visitor problems to our Adviceguide site concerned information on benefits, tax credits or tax. Table 1 below provides a high level summary of the number of enquiries we received on different issues in 2007–08.

Table 1

NUMBER AND TYPE OF PROBLEMS 2007–08

Problem area	*2007–08 CAB client problems England and Wales 000s*	*2007–08 Adviceguide visitor problems 000s*
Debt	1,737	644
Benefits	1,516	1,533
Consumer and financial services	286	451
Employment	476	1,857
Housing	399	943
Legal	275	531
Relationships and family	295	974
Tax	48	1,146
Utilities	95	1,092
Other	413	233
Total	**5,540**	**9,404**

6. A more detailed breakdown of the volumes of enquiries received on different benefits issues by CABx in 2007–08 is at Annex 1. Benefits is the major area where we are providing information and advice on government services and relying extensively on government produced information to be able to deliver our services. As can be seen from that table a significant proportion of our 1.5 million benefits related enquiries last year were from people asking about disability and incapacity benefits or benefits for pensioners.

CAB Telephone Services

7. The Citizens Advice service does not currently deliver services via a national call centre service. Around 20% of advice given by bureaux is given over the telephone and some bureax and groups of bureaux have mini-call centres and dedicated helplines operating at a local level. We do however recognise and wish to address the fact that there is considerable unmet demand for our services and many consumers have difficulty getting through to their local CAB.

8. The fact that we do not have a national call centre type service is due to a combination of factors over time. First, there has not been sufficient funds at national level to commission and run such a service. Second, at present local bureaux are funded predominantly from local authorities and other funding sources such as PCTs or the Legal Services Commission, which are commissioning and supporting a local or geographically specific service. Notwithstanding this, our strategy is to move to create a single telephone number for the service by 2010 as we believe this will make it easier and simpler for potential clients to gain access to the help available from the CAB service and for the CAB service to collectively manage demand better. Pilots for this service at a local level have focussed on either establishing a virtual call centre (where a number of local bureaux share the same number and route calls between the different outlets) and/or working in partnership with another organisation which has a bulk call handling facility to provide a telephone "reception" service under our brand. These pilots continue.

Our Information Systems

9. To ensure the information and advice we give is accurate we provide training to all new CAB volunteers and provide all CABx with a bespoke information system known as AdviserNet. This is updated constantly for changes in law and must be consulted and referred to by all our advisers when they advising clients. Daily supervision and checking of case records and regular quality of advice audits establish that advisers have used the system appropriately. AdviserNet is available on subscription to other advice giving organizations. Currently it is used daily by CAB advisers in 423 local bureaux. Over 600 other organizations also subscribe to it including libraries, solicitors, trade unions, MPs offices, charities, colleges and community organisations.

10. In order to produce our information systems, and give advice in local bureax, the Citizens Advice service is a major user of government information about legal rights and responsibilities and government services, especially welfare benefits and tax but also covering a wide range of other areas.

11. Our practice in producing information for advisers or the public is not to duplicate content unless it is necessary to do so—our information professionals therefore routinely identify government (and other) produced information which is both hard copy and web based to integrate into our system or to link to for those users and advisers using our web based information. Whilst we are selecting government and externally produced information which is going to be relevant and useful this also means we are dependent on the continued existence and effectiveness of that material. To illustrate the range of our "dependence" on government produced information AdviserNet contains a total of 283 government produced information items and leaflets, a full list of which can be found at Annex 2.

Access To, and the Quality Of, Government Information Materials

12. In AdviserNet, our information source for advisers, we include many links to specific government website pages and other documents (such as codes of practice). In Adviceguide, our internet-based site for the public, we have a number of links to government sites, most particularly to Directgov for public information. Our own written advice documents within AdviserNet and Adviceguide are our interpretations of current legislation and case law, written to best meet the needs of our advisers and clients as we understand them. As such our material often translates a body of legislation and regulation into a simplified, structured and logical form which addresses the problems people are presented with.

13. To keep our information up to date we need to keep abreast of changes in government information. We use the daily e-mail alert service from info4local.gov.uk for government news and updates on policy and legislation. This is a service that central government provides for local government but is freely available to other subscribers.

14. As noted above Citizens Advice is a major user of government information online, most notably Directgov, designed to provide a single point of access to public sector information and services. Directgov is, on the whole, a very good source of government information for the public and we admire its plain English style and its ease of use. It is an improvement on the previous arrangement of multiple sites—though as we highlight below there is scope to improve. We often refer members of the public to this website from our website.

15. In recent years the Government has switched from providing public information in the form of leaflets, letters and other written communications to providing information on the internet or by electronic communication. In short, information that used to be contained in a leaflet is now generally only to be found on a website—or alternatively by telephoning a government helpline or contact centre.

16. We recognize the cost savings and efficiencies that can be achieved by moving from printed materials to electronic publications. Hard copy publications giving information about legal rights and entitlements, particularly on welfare benefits, can become out of date quickly as things change frequently and once in widespread circulation it can be costly and time consuming to ensure that all copies of information in use are up to date.

17. The internet is clearly a fast and efficient method of imparting information to the public. But not everyone has access to it, or knows how to use it. Many of our bureau clients do not have internet access (particularly the over 60s or those from the poorest families) or are prevented from making use of it by lack of literacy, by physical and mental health problems, or because their first language is not English.

18. People who are excluded in these ways will need advice services more to help them make sense of government information and to act on it. In this context it is not evident to us that government departments are recognizing in their delivery plans that switching information to web channels may have the effect of

increasing the need for voluntary sector information and advice providers to act as a bridge to reach the most excluded members of our society.

19. Clearly the Government is right to want to utilize modern communication methods, as well as wishing to keep public sector costs down. But the increasing use of "one size fits all" solutions is simply not suitable for all service users. If certain groups in society need to turn to advice agencies and intermediaries simply to help them locate and "translate" government information, then the government's methods of delivery are not working effectively for those expected to benefit. What is more, such actions effectively displace the responsibility to deliver services equally well to all government service users away from government. The strategy may also inadvertently create a new and potentially disempowering dependency or barrier to information. Individuals who previously might have been able to pick up a leaflet in a public place may now need to go to an agency who will look something up on the internet for them and potentially print it out. For this group of individuals the move to internet only publication may be more excluding and disempowering.

20. Finally, as many CAB clients do not have access to the internet—or may not know where to start in locating complete information on their problem—CABx often report they feel the costs of enabling people to get access to government information are being displaced onto them in printing out leaflets and booklets for clients. We would do this so that the individual can read the information themselves and refer to it later. Some government information items are small booklets detailing legal procedures which our client may need to study at their leisure or be able to refer to as they seek to resolve their problem. Clients who could manage to resolve problems themselves, without representation, are assisted by having public information on paper. But it seems that the costs of bringing this about are now located outside government in a substantial number of cases.

Developments in Government Helplines

21. The Varney report (*Service Transformation: a Better Service for Citizens and Businesses, a Better Deal for Taxpayers, December 2006*) made a number of recommendations for government to change the way services are delivered to the public. The report identified the multiplicity of contact points an individual might have to have with government and has led to a significant number of programmes aimed at transforming services to reduce the extent of duplication in contacts. Citizens Advice is represented on the Delivery Council and supports the goals of this programme in improving the experience of service users. One area of focus has been with government helplines where Sir David's report highlighted the multiplicity of different helplines, suggesting that these could be simplified into possibly one single telephone number for government. The Delivery Council is also overseeing a programme of work to develop standards for contact centres run by government.

22. For most individual consumers contact centres can often work well. They enable people to make contact from the comfort of their own home, at a time that suits them and many problems can be resolved quickly and easily. For people with mobility problems or limited access to transport, being able to make contact from home is a great advantage.

23. However, there are other people for whom the phone is simply not the most suitable or appropriate method that they would choose to deal with government, or any service provider. This is true of many people with mental health problems, people with physical and in particular hearing and speaking disabilities. Telephones may often be inappropriate for people in hospital or for prisoners who may face very high call costs and for other people who have no access to landlines or have to rely on expensive pay as you go mobiles.

24. Citizens Advice has reported regularly on the shortcomings of call centres for consumers, including in its July 2007 report "*Not getting through—evidence on the new system for claiming benefits from Jobcentre Plus*" which highlighted that 93% of bureaux were experiencing, at that time, significant delays in contacting some parts of Jobcentre plus and more than half of bureaux had reported that their clients had been refused alternatives to the telephone as a method of dealing with Jobcentre Plus. We hope to see improvements in a repeat survey.

25. More widely, our research on call centres covering the utility and government sectors (*Are you being served?—evidence on contacting utilities companies*, January 2008) has found that levels of dissatisfaction with call centres is high—25% of those people who had contacted a government agency by telephone were dissatisfied with the way their call was handled. This was a higher level of dissatisfaction than found for those contacting retailers or banks and building societies and almost on a par with the 27% of consumers dissatisfied with their utility company's call handling. Reasons for dissatisfaction were most commonly about the time taken to get through, including the use of menus and queues, costs of calls and lack of competence of call handlers in actually being able to address problems.

Challenges for Us of Working with Government Information

26. The key challenges we have faced in working with and needing to rely on government information include the following issues:

Limited or no notice of statutory publications and codes

Recent examples include:

— The Communities and Local Government Department (CLG) issued a consultation on choice based lettings in January 2007 and responses were due by April 2007. It is normal to expect the document (in this case a Code) to be published soon after the consultation response deadline. However this particular Code was not published until the end of August 2008 and with no notice. We had been in contact with the author of the code at the CLG and requested that we at least have sight of a draft so that we could prepare information for CABx in good time for the start of this Code. But this was not provided.

— The legislation and Code of Practice for identity cards to be introduced on the 25 November 2008 is still only in draft form.

— Regulations made under the Consumers, Estates Agents and Redress Act 2007 (CEAR) presented difficulties for us with the timing of The Postal (Consumer Complaints Handling Standards) Regulations 2008 made on 3 September and due to come into force on 1 October, and the timing of the approval of the redress scheme. Briefing packs were sent out about two weeks before the CEAR Act was due to come in to force by which time it was too almost too late to include the helpful practical information in our information system due to the lead in times for our publishing and distribution process.

— Currently we still have no date for implementation of Tiers 2 and 5 of the points based system. The only date published on the UKBA website is November 2008—no actual day.

Last minute changes

— A recent example is the Social Security (Miscellaneous Amendments) (No. 5) Regulations 2008 (SI No. 2667), which were laid before parliament on 9 October 2008 and come into force on 30 October 2008. This often happens with miscellaneous changes to social security law.

Government departments not being responsive to our requests for them to check our material

Departments are quite inconsistent in their approaches to working with our information needs. Some are very helpful and responsive to requests for support to enable us to get accurate information out to bureaux in time. But this is not universal. For example:

— Employment and Support Allowance (ESA). This is a major new welfare benefit being introduced this autumn effectively replacing incapacity benefit for new applicants. To enable bureaux to be prepared for enquiries at the end of October we would ideally have wanted a programme of information and training to them over the summer of 2008. The Department for Work and Pensions agreed to check our document entitled "ESA: advising clients now" in the middle of May 2008, but did not agree to check our full advice documents for AdviserNet till the start of August 2008. We had several meetings and contacts with them during the spring asking for their support for our needs relating to the introduction of this new benefit. Getting their agreement took four months of emails, phone calls, and meetings. This is in spite of a longstanding and established relationship with the DWP.

— Since the beginning of September we have been trying to find out a timeline for when the various provisions of the Housing & Regeneration Act come into force from the CLG but with no response to date.

Possible Improvements in Government Information Production

27. From the perspective of Citizens Advice, producing the national AdviserNet and Adviceguide information systems, there are a number of ways in which government departments' management of information production could improve so as to help us do our job. These range from simple operational issues to strategic issues.

Information on Changes to Government Leaflets and Sites

28. It would be helpful to be advised when all/any government leaflets are revised and reissued. Without this information, we are dependent on constantly searching government websites for new editions and this is a time consuming and potentially unreliable way of obtaining this information. The Inland Revenue and the Benefits Agency used to send regular updates, but apparently this service is no longer available from HM Revenue and Customs or the Department for Work and Pensions. It would also be useful to know, possibly by an e-mail alerter service, when government websites have been amended or had new content added. It would also be very helpful to know in advance when government leaflets are due to be reviewed. Amendments to leaflets sometimes appear on government websites and we would like to know when these changes will be incorporated into the primary leaflets.

Ensuring Government Information is Up to Date

29. The UK Statute Law Data Base from the Ministry of Justice (http://www.statutelaw.gov.uk/) needs to be brought fully up-to-date with revised legislation. It would be an invaluable resource, both for ourselves and for the public, if it could be relied on to display fully updated legislation, but we are unable to use it as a reliable source at present.

Better Advance Information to Help us to Plan

30. We frequently have insufficient or extremely short notice of changes to legislation and government communications campaigns aimed at the public where there is a desire for the CAB service to be engaged as a distribution channel. In the latter type of situation it often feels as though the voluntary sector role is an afterthought—we are not brought into the conversation and planning at an early stage to advise on whether the campaign makes sense, and when it might be best to run it. And, as in the examples above, statutory instruments are often published at the last minute and with insufficient time for us to publish amendments to our information, both for advisers and for the public, before the law is in force. We would be happy to provide the Committee with some specific examples drawn over the past year.

Languages and Needs

31. We are often asked for written information (both web based and hard copy) in languages (such as Polish) which do not seem to be widely available or easy to find within government information. Whilst there may be an argument that those resident in and working in the UK should be able to deal with matters in English the practical reality is that many residents today do not have English as their first language and we are an increasingly diverse society. Relying on only one language is unlikely to be effective in reaching all who potentially need to not only know information but to understand it properly. There is also limited information available which has been produced and designed specifically for people with learning disabilities.

Information Produced Remains Siloised

32. Individual departmental information products and websites vary greatly in ease of use and their lay-outs are not consistent. It can be difficult to find things within government sites as a result, for example equality policies. A greater consistency of approach would be a boon here for organizations that need to hunt for information regularly on the internet. In our case this is not just a "nice to have" since we are trying to locate information and "translate it" for almost 10 million users a year.

Transforming Service Delivery

33. Moving government information for the public into one website portal (Directgov) will make the starting point for individuals needing to find information about all government services simpler—just one web address as a starting point rather than multiple sites with different designs and organization approach. But ensuring that the information contained in Directgov, and the back office processes supporting any applications and contacts from the public is presented to the individual in a "joined up" way remains a challenge. To give a straightforward example for benefits information, Directgov does not cover some important areas. For housing benefit—a major welfare benefit which covers the housing costs of people on low incomes— the site visitor is asked to refer to his/her to local authorities for more information. The quality of local authority sites also varies greatly. On a more significant level despite the laudable aims of Sir David Varney's report of December 2006, *Service Transformation: a Better Service for Citizens and Businesses, a Better Deal for*

Taxpayers, there is a long way to go before an individual contacting the Tax Credits Helpline is given accurate and complete information and advice about all their benefit entitlements.

34. Until and unless government welfare benefits services are integrated it will continue to be the case that many people who move from benefits into work, supported by Tax Credits, will fail to claim benefits like housing benefit and council tax benefit even though the HMRC has information about their income to enable them to advise on potential eligibility.

Conclusions—Are Government Communications Effective?

35. The key test of the effectiveness of government communications should be that they reach people expected to benefit and that as a result they are better informed about their rights and responsibilities, and act appropriately. Often government communications are calling individuals to act—to apply for benefits and help in particular, to complete forms, make payments or receive payments. One measure of the effectiveness of such communications might therefore be whether the groups those communications are trying to reach do actually respond to communications which promote services and products. In the private sector a measure of consumer take up or sales would certainly be a measure of the effectiveness of advertising and marketing spend.

36. Whilst there are many examples of low take up of government initiatives the most significant evidence of failure of communications can be found in the fact that there are persistently high levels of underclaiming of benefits and tax credits. For example a DWP press release date 19 March 2008 made it clear that an estimated £1.8 billion of Council Tax Benefit is going unclaimed each year and that people "could be owed as much as £600". The total non-take up of means tested benefits is estimated to be up to £10 billion. Specifically this means only a 50% take up of housing benefit amongst households in work and only 22% take up for working tax credit for households without children.

37. Whilst there are cultural and experiential barriers to people claiming welfare benefits, it is puzzling why £3 billion of unclaimed pension credit is still sitting there unclaimed at a time when the inflation rate experienced by people on low incomes is high as the costs of basic essentials such as fuel and food have risen dramatically. When Citizens Advice Bureaux undertake community based benefit take up campaigns we are highly successful in reaching the people who are missing out on significant amounts of incomes. We put this down to the trust and personalised approach we are able to provide. The communications being used by Government (content and methods) are clearly not reaching all those that welfare benefits are intended to reach.

38. So we think the government has a significant way to go in improving the reach of its communications and prompting take up of benefits and tax credits. The key to improving its effectiveness in this area may be how well it works with the trusted intermediaries, such as Citizens Advice bureaux in getting information across to the public and particularly those sections of the public who most need the information. The need for advice agencies is heightened by the "one size fits all" approach and more remote and impersonal service delivery methods such as Directgov and contact centres.

39. However, there is a widespread failure of government information providers to plan properly for distribution of their communications with and through the voluntary advice sector. Voluntary advice agencies should be seen as integral to all departmental information and communications plans—but too often "can we get it out through CABx" is an afterthought rather than built in at the beginning of a plan—and as we have mentioned in our evidence above we are often needing to lobby officials to get assistance from them to check our information content and training materials when major pieces of new legislation are introduced.

40. As we have noted above, the move to establish Directgov as a single web based portal for government information and the potential move to a establish a single number for all government "helplines" has potential to improve access to government services at the starting point. We believe there is a genuine desire at senior levels in government departments to not only reduce costs but to transform the experiences of citizens trying to use government services. However there remain challenges to achieving this for all.

41. First, these initiatives may not help some members of our community get access to services because the methods of delivery used will not be effective for all service users. [See Reaching Out: An Action Plan on Social Exclusion—Social Exclusion Taskforce September 2006]. As well as working better with the voluntary sector, complementary communications services addressing language and capability barriers will be needed. It is not clear how in moving to single points of access the Government is working as hard to maintain adequate reach to those in our society who will find it most difficult to deal with matters on the internet or over the telephone. As a result, certain groups in society will need advice agencies and other intermediaries more in future to help them locate and "translate" or get through to simple government information and services because the

methods and manner of delivery is just not reaching them. This could be viewed as displacing the responsibility to deliver services equally well to all services users away from Government.

42. The second challenge is that whilst presented to the public in a single site, or on a single phone line the actual services offered by government, and back office systems, are far from integrated—particularly in the area of benefits and tax credits. Young parents moving from benefits into work still face a chase around of more than one national government claim handling service and local government services to gain access to all the income supplements they are entitled to as the processes are administered separately in government and as yet no single government service provider gives information and advice on all these entitlements to the same extent that the Citizens Advice bureau is able to do.

October 2008

Annex 1

VOLUMES OF ENQUIRIES RELATING TO BENEFITS AND TAX CREDITS (2007–08)

Type of Benefit	*Number of enquiries*
Income Support	144,228
Pension Credit	68,376
Social Fund Loans—Crisis Loans	16,749
Social Fund Loans—Budgeting Loans	9,082
Housing Benefit	169,682
Child Benefit	38,017
Council Tax Benefit	153,305
Working & Child Tax Credits	144,605
Jobseekers Allowance	68,052
National Insurance	10,400
State Retirement Pension	24,129
Incapacity Benefit	120,100
DLA—Care Component	169,222
DLA—Mobility Component	146,959
Attendance Allowance	48,712
Carers Allowance	38,881
Other benefits issues	123,082
All Benefits and Tax Credits	**1,515,483**

Examination of Witnesses

Witnesses: Ms Teresa Perchard, Public Policy Director and Ms Fiona Monroe, Information Officer, Citizens Advice, examined.

Q428 ***Chairman:*** Good morning. I am not Lord Fowler; I am afraid, sadly, he is ill and is not able to be here today, so I am standing in. I am a normal member of the Committee promoted to this very elevated position for just this day. At any rate, can we welcome you very much? Thank you very much for coming and for helping us in our inquiry into Government communications. Obviously, you, your colleagues and all your volunteers in the Citizens Advice Bureaux throughout the country have very keen and pretty clear knowledge and thoughts on the quality, or lack of it in other cases, of Government communication. Is there anything you want to say by way of opening, or can we go straight into questions?
Ms Perchard: Just briefly, if I may introduce us. I am Teresa Perchard, Director of Policy at Citizens Advice. My colleague, Fiona Monroe, is a member of our information department at Citizens Advice and has also worked as a CAB adviser, so she has been on the frontline and producing information for our advisers to use. Our written evidence focuses very much on our role as an information provider for the public and our reliance on government information to help us do our job. We are a national charity providing support services to a network of local charities throughout England and Wales, and bureaux in Scotland and Northern Ireland also use the information that we produce. We are helped to do our job better by having timely, accurate and complete information from government about individuals' rights and responsibilities and, in advance of changes to those, good notice so that we can prepare not just information but, also, training for our thousands of volunteers. We have 16,000 volunteer advisers in England and Wales alone. Our evidence aims to summarise the channels we use to produce information for our advisers for them to use with their clients and for the public directly through our own website, and, in an annex, highlights a number of government leaflets that we are reliant on in our information system. We then go on to discuss government trends in producing information via the internet, developments in government help-lines and challenges we face working with government, and I am afraid it is a list of things we would like to see improved. We do not want it to come across as a whinge but this is an important opportunity, perhaps, to say there are areas where these things could be done better and suggest improvements in working methods. We have not provided you with any evidence on the question you are looking at of—let us call it—"spin" in government communications, and we have not provided any evidence on citizen engagement in policy making, but we do have a lot of experience because we respond to a lot of government consultations and we would be happy, if you wanted more evidence on that, to provide it at a later date. I just thought I would mention that as an introduction.

Q429 ***Chairman:*** As it is an opportunity just to put a few things on the record, you have confirmed—and I think we all know—the tremendous work that all the volunteers do, and the 16,000 you just referred to who work in this field. What is the sort of central organisation that you have that enables these volunteers to actually operate?
Ms Perchard: Citizens Advice is a national charity but it is one largely supported by public funding, in particular a core grant from the Department for Business, Enterprise and Regulatory Reform. The national organisation provides a range of support services, membership services for member bureaux. We specify our membership scheme and we audit bureaux; so we audit how they are organised and managed, and we audit quality of advice. So we have resources going into safeguarding the quality and effective operation of the CAB network. We have been in business now for nearly 70 years, so we must be doing something right in terms of having a stable network which has 96% public awareness. We have teams of people working in the regions, and in Wales, who work with bureaux to help them with their local funding, governance and management requirements. Bureaux are reliant on local government funding; some of them have annual funding, funding that can go up or down, which makes service levels sometimes quite volatile, and we provide management support services to 426 member bureaux, each of which is an independent organisation responsible for its own finances. We have a training team which designs and organises the delivery of training for 4,000 new volunteers every year. We have many volunteers who

stay for a long time but 4,000 new ones join us every year. We run a volunteer recruitment line nationally, which had 12,000 new applications last year. These are all the sorts of services that Citizens Advice provide. We have a team in our information department who write all of the information that our trained advisers need to refer to in order to provide accurate, up-to-date legal advice. We insure all of the advice given by the CAB services; we have a group insurance policy for giving wrong advice. So we are trying to ensure that the advice is right, where possible, and if not there is an insurance against that. So it is about protecting the public from bad advice. Our information system, AdviserNet, which is used by advisers when they are working with clients, is incredibly comprehensive: it covers the entire welfare benefit and tax credit system, and then issues like high hedges and what to do about them, electoral issues—everything you can think about that a citizen today might come to us for advice about you will find in our AdviserNet system. Then, to back up that, in providing information to the public, we have a website called "Adviceguide", which is currently being used by over 7 million people a year who look at it for information on about 9.5 million problems. People who come to the CAB service often have more than one problem; particularly because our clients are, predominantly, people on low incomes and reliant perhaps on welfare benefits, a combination of problems is very common of welfare benefits, debt, housing or employment. Those are our big, big problem areas in volume terms.

Q430 ***Chairman:*** If you are right at the frontline, you say you never know what the next problem is that is going to come through your door, but would I be right in thinking that a very substantial number are either debt issues or benefit issues?
Ms Perchard: Yes, those are our big two areas.

Q431 ***Chairman:*** You will get, if we are moving into quite a difficult economic time, a very early indication—one of the earliest indications—as to whether there are really serious problems arising over debts, repossessions and all that sort of stuff. Does government draw on your information, as well as you wanting information and communication from government? Do you have good statistics that can help the Government as to what is really happening?
Ms Perchard: Yes. Yes, we do, and they have got better. Actually, our debt boom was about five years ago. That is when the number of consumer credit debts coming to the CAB was sky-rocketing, and we were the first organisation going into government and saying: "There are big problems with debt", and everyone was saying: "No, no, no, no; the economy is very benign". We were saying: "How come we have had a 40% increase in consumer credit debt problems?" "Oh, it is just a small number of irresponsible borrowers and lenders, and not a sign of anything bigger". Actually, we have seen, thankfully, a reduction in consumer credit debt problems, and certainly some of the bigger lenders changed their lending policies a couple of years ago due to higher levels of bad debt provision. The big lenders, like the Barclaycards of this world, make more of an impact on scale when they change their policies than a small lender. What we have been reporting over the last year, though, is a step up in the number of mortgage arrears that we have been dealing with and we have been reporting that for the last year—the Government is well aware of that. There are a lot of other data about mortgage arrears—and fuel debts as well. I think what we are often able to do is to describe the type of people who are coming to us with problems about fuel debt. Particularly on fuel, people who are not pensioners but who are living on benefits, who are not getting a winter fuel allowance, are finding that very hard to deal with at the moment. So that leads to a conversation about other groups that might need extra help. Just in the last quarter we have seen a significant increase in some employment problems—redundancy and dismissals. JobCentre Plus is, clearly, well aware of that issue because the applications for Jobseeker's Allowance have also increased significantly. So we have regular conversations, but we also publish our statistics, and our latest highlights were published on 10 October—our figures for last year and the first six months of this year.

Q432 ***Chairman:*** That is extremely interesting. If we could, perhaps, just come back to the key part, you depend on government: an awful lot of the information that people come to you about, you, in turn, have to get from government in one form or another.
Ms Perchard: Yes.

Q433 ***Chairman:*** We have been looking at the Phillis report, which talked about direct, unmediated communication with the public. How well do you think that is going?
Ms Perchard: I cannot pretend we followed the Phillis report, but the area of unmediated communication that we are most closely involved with is the development of Directgov, although that has come out of a different place in government—the Varney report, particularly—in looking to simplify the public's access to information about government services by bringing it together in one website, so that things are easier to find. We would not particularly have any comments on what has been going on in government to address the Phillis report specifically on unmediated communication.

Q434 ***Chairman:*** Does the government communicate directly with you? Does it see you as a specific outlet for its information and communication? Does it train you at all?
Ms Perchard: Does it train us?

Q435 ***Chairman:*** Any of your people. When you get into significant changes in benefit or other issues that you have to pass on, do you get any help on that from the Government?
Ms Perchard: Variable. In our written evidence we highlighted a number of examples where we have, perhaps, had very late information from government about how something new was going to work. A particular, current example is the introduction of Employment Support Allowance, which comes in next week, I think—27 October. It replaces Incapacity Benefit for new applications, initially, so the number of people who would be claiming Employment Support Allowance might be quite small at the start, but it will eventually replace Incapacity Benefit. As our written evidence documents, for about four months, through repeated emails, telephone calls and meetings at ever-higher levels, we were trying to get DWP to do exactly that—to share with us their training, which they were rolling out for their employees, to our advisers—but, also, to really help us get our information for our advisers and the public straight, because a lot of people come to Citizens Advice Bureaux about benefits issues. This is a complex change. There has also been an issue whereby if people did not claim Incapacity Benefit before 27 October this year they would actually have a lower level of benefit by claiming Employment Support Allowance. That is something we have been concerned about as well. I do not want to paint government officials as not trying to be helpful, but they are often in a managed programme and plan of activity with a budget, which is very departmentally focused and very delivery focused within the department. As we suggest in our evidence, one way of getting out of this is to, at the beginning of a plan of introducing something new, build in plans for working with the voluntary advice sector, not just CAB. That would improve things substantially, because when officials are midway through implementing their project and we are saying: "Could we please come on some of your training? Could you please check this material that we have written to give to our advisers?" it is not in their plan, and we are lobbying after the delivery plan is already in train to try and get help. They say: "We haven't got any budget to train you lot; that wasn't in our plan". So we would like to be in at the beginning much more and to be less of an after-thought, where we are running to catch up, and more integrated into plans for distribution of information, particularly with big legislative changes.

Q436 ***Baroness McIntosh of Hudnall:*** Can I just unpack that a little bit? With certain kinds of information, presumably, particularly in relation to benefits—anything that the Government is directly involved in administering—the Government has its own ways of communicating with the people who might need to know about it, for example, through JobCentres or whatever. With the people who come to see you, do you have a sort of impression, or indeed do you have any statistics, to tell you whether those who eventually wind up coming to you for advice do so after they have tried to get advice from the relevant government department, or in parallel with it, or not having attempted to get it from that source?
Ms Perchard: All three. I hope we can bring in Fiona on this with some examples, but it is quite common that people will find that they have been rebuffed. There is a long history about the practice of JobCentres sending people round to the CAB simply to get an application form for the Social Fund. The displacement of people on to the CAB service is not a new phenomenon. A lot of the people who come to us for help with dealing with Tax Credits have done so because they have not been able to get a successful outcome from repeated telephone conversations with the Tax Credit helpline or the debt recovery unit about recovery of overpayments; they are still confused and perplexed and being asked to repay thousands of pounds very quickly, and they cannot afford it, they do not know where to go for help, and the CAB is often mentioned as a source of help and advice in government information. So, of course, they will come to us and we are better informed to be able to try and get to the root of the issue and, also, have a conversation with the government officials concerned to try and resolve the problem. It would be much better if the front line in government services was handling inquiries from their customers much better than they are, on two levels: firstly, just competence and knowledge of the products that they are dealing with, but, secondly, knowledge of other products and services that the individual might be entitled to. So a lot of people who may be eligible for Tax Credits are also eligible for help from the Council Tax Benefit system or Housing Benefit, but are not advised to claim. I think Fiona has some examples from a bureau in Kilburn which illustrate that. Somebody has come to us, having been to a government department and come away not having been told about all of their entitlements.
Ms Monroe: Yes. If I could add then, the administration of benefits is so fragmented between departments, and even between sections within departments, that I think that adds to the difficulty of training staff or having staff who are experienced—or they have no knowledge, possibly—in the other benefits that somebody might be able to claim. I have

several examples here. The Pensions Service failed to advise a pensioner couple that they were entitled to Child Tax Credit as well as Child Benefit, as a result of which they went without that money for three years. It is, possibly, relatively unusual for a pensioner couple to have a dependent child but, nevertheless, that is the kind of information that is being missed between the Pension Service and the Revenue, basically. Frequently, the inter-relationship between benefit claims can be very complicated. They have what we call "passporting benefits" (which you may be familiar with) where, in order to qualify for a benefit, you need to be in receipt of another benefit. For example, to get disability premium with your Tax Credit you need to be in receipt of Disability Living Allowance. It is absolutely critical that you make your claim on time, that is, when you enter a claim for Disability Living Allowance. At that point, you have no change of circumstance to report (all you have done is fill in a form and send it off; you do not know whether you are going to get it or not) but, as a result, if your claim is successful, then you might be entitled to an additional premium with another benefit. However, you may well miss out on the backdating if you do not fill in those two claim forms at the same time. That is so frequently missed that people lose out on the money that they are entitled to because they have not made that claim on time.

Q437 ***Baroness McIntosh of Hudnall:*** But, just in terms of the communications issues, what I would gather from what you have said is that it is an inter-departmental failure in the sense that information that is coming from one Department is not properly tied up with information that is available from another and, therefore, it has this impact.
Ms Monroe: Yes.

Q438 ***Baroness McIntosh of Hudnall:*** So that leads into questions about the integration of government information, yes?
Ms Monroe: Yes.
Ms Perchard: Absolutely, and, more importantly, the integration of services, because the information is just the sort of front end of it. The Directgov site is admirable in bringing everything together in one place, but what is going on behind it is not and, if you start there, you end up where you could be shooting off to four or five different places and a local council to try and get all of the income that you are entitled to from different parts of government.

Q439 ***Chairman:*** Obviously, it is a very important part of your work and one that is enormously important to your clients who come, and it may be a problem that the actual person in the benefit office, or whatever it may be, is busy and the rules are changed and all that. Are there any other illustrations outside the benefit field, where people are coming to you because they do not know what is going on, where you think government communication should be better?
Ms Perchard: I do not know if we have got any suggestions here, but I think at any one time, the sort of current issues we have highlighted in our written evidence are things that are about to come into effect where there is still no detail about how this is supposed to work. There is the points system for immigration and migrant workers due to come in in November, next month, but there is no more information about the scheme, to the best of our knowledge, so it is quite possible that people might be coming into CAB asking about this, uncertain about it, and they might go to an independent organisation before going to the Government to ask, if you see what I mean. I think it is where something is known about and it is going to happen, but actually the detail is not available sufficiently in advance for people who are affected to have any warning, and that could be in many different areas. I think choice-based lettings was another issue we highlighted. There was a consultation in 2007 and a code of practice dealing with this, applying to social landlords, only came out a year later, so in the interim period we might have had some people asking, "What's going on with this?"
Chairman: I think we see where we are having problems. I think we ought to move on.

Q440 ***Baroness Bonham-Carter of Yarnbury:*** I want to talk specifically about communications and the way in which the Government uses the media to communicate through, and I just wonder if you agree with what was in the Phillis Report, which is that the Government spends a disproportionate amount of its time and money communicating with the media and should be concentrating more on communicating directly with the public.
Ms Perchard: We have not undertaken a review of how government departments are allocating their spend. The view I take really on this is that the media is a channel to the public, and I think the Government needs the media more to reach the public than it might be able to do itself, unless it started its own news channel and set up its own daily newspaper. Marginally, the media is trusted more than the Government.

Q441 ***Baroness Bonham-Carter of Yarnbury:*** That was going to be my next question actually. Do you find that people do believe what they read in the media about the Government?
Ms Perchard: Well, I have had a quick look at some of the research on trust. There was a very good BBC survey about media and government trust in 2006,

which you have probably had a look at, and people around the world vary in their level of trust of their governments and the media. In Nigeria, 88% trust journalists compared to 34% trusting the Government, and it is slightly the other way round in the UK, but people are really using the media and hunting for news much more than they are looking on government websites for information about what is going on. I think in the current environment the media have been the primary source of information for people about their savings, the economy, what they should do, so the media has a lot of responsibility in the hot economic situation that there is currently to be informing the public and people making decisions about what to do with their savings as a result of what they are learning through the media.

Q442 ***Baroness Bonham-Carter of Yarnbury:*** So you would think that the Government's strategy in its use of the media is one that you understand?
Ms Perchard: I did not say that! I am not sure what the Government's strategy in its use of the media is. No one can ignore the media. If you are a charity trying to raise funds, get support, if you are an information provider, like us, trying to tell people about things they are entitled to or responsibilities they have, you will not be able to reach people quickly and in volume unless you work with, and through, the media. It is a fact of life in today's communications. People are less trusting of internet blogs and things like that because they do not know where they came from, but the BBC, a big, trusted brand worldwide, and national newspapers, they carry a lot of trust, though not as much trust as the charities, so maybe we should start a news channel!

Q443 ***Lord Corbett of Castle Vale:*** On this point of trust, do the numbers you gave us on the way people trust the printed media distinguish between editorial content and advertising?
Ms Perchard: No, I do not think so.

Q444 ***Lord Corbett of Castle Vale:*** So, if I remind you that the Government has been running an extensive advertising campaign on these new rules for migrant workers, you will have seen all the hurdles? Have you seen the adverts for the hurdles which succinctly tell you what is on and where to get more information on it?
Ms Perchard: Yes.

Q445 ***Lord Corbett of Castle Vale:*** Why should that not be trusted? You are offering information. This is why I asked the point about editorial and advertising.
Ms Perchard: I did not say that advertising taken by the Government or anybody should not be trusted. An advert is drawing somebody's attention to something and asking them to act, to ring a number, to stop doing something, to stop throwing litter, and buying space in print or on the web is a legitimate standard of public communication; I am not criticising it.

Q446 ***Baroness McIntosh of Hudnall:*** I want to wrap up several questions really around the question of the use of the internet and websites as a means of communication and to give you a chance to amplify the information in your written evidence, which does suggest that, although the development of internet sites that the Government and indeed other people have put a lot of effort into over the last few years is a useful development, it actually has some significant shortcomings. In particular, therefore, can you talk a bit about your own use of the Internet, your perception of how the Government's use is developing and particularly talk a bit more than you do in your evidence about the exclusion of certain groups through either, as you say, language difficulties or technological challenges. There is a further bit I also want to get on to about departmental variances, but we will perhaps come to that in a minute.
Ms Perchard: I will just kick off on our use and then perhaps Fiona can come in on what we think of Directgov, which is the principal portal, and then on to the exclusion issue. We have been running a public information website called 'Adviceguide' for some years now, probably about eight or nine years, and it is a really important part of our information strategy to reach the public. Through that, we note that many, many more people use us for information on tax than come in to local bureaux and many more people use that information on employment rights than come in to local bureaux. We know we are reaching people through that website that would not necessarily come to a CAB or, on the tax front, they are probably finding our information much, much simpler than anything else they have been able to find. But we take the view that we are not trying to duplicate, we have not got the resources to duplicate the Government and others, and our site is also a portal, so we have lots of links to other things. We have fact sheets, top tips and a slightly sort of current edge to it, so, if there is something very current and new, that is on the front page and that changes, so we use the internet towards the public as part of our strategy for helping more people and in different ways. Then our other system, AdviserNet, is web-based, but it is private to our advisers and those who subscribe. Fiona, would you like to talk about Directgov a bit?
Ms Monroe: Yes, and, before I talk about Directgov, just to say that in the production process of AdviserNet, which is our primary product for advisers and is very large, and our offspring product, which is Adviceguide, we rely very heavily on using

government websites, including both the departmental websites and the Directgov website. Not only do we use them in the production process to find out the information that we need to write—I should say that mainly we write from statute and regulations, from original sources, but we also use codes of guidance and so on—but we frequently link from our information for advisers in order to amplify the information that we give them, and we send them to government websites. When we do that, we always send them straight to the document that they might need, for example, the Code of Practice on Homelessness. If they are challenging a local authority decision, then they might need to refer to that Code of Practice or find it useful, so we will give them a link straight to that, but in the context of the information that we are providing about homelessness law and its entitlements. On Directgov, personally I am impressed with its presentation and its use of plain English, and I think it is well-written in accessible language. It contains lots of links to relevant information, and I find it quite easy to search. When you use the search facility, unlike some government department websites, Directgov comes up with quite a meaningful list of documents with headings that actually tell you what the document is about in a brief document summary, whereas you can search on some government websites for a term and you will get a completely meaningless list of document titles or numbers with extracts from the document reproduced and it does not really tell you where to go. Directgov has some shortcomings inevitably and not everybody finds it easy to get to where they want to go. To take benefits again, it is quite fragmented, but this is possibly a reflection of the benefits system rather than the website itself. One of my colleagues wanted me particularly to emphasise that it does not deal with extent issues well, that is to say, it says that it provides some information about services from the UK Government, but it does not tell you where the differences are between England, Wales, Northern Ireland and Scotland, which is something that we are very particular about on our own websites, both of them. Its greatest shortcoming of course is for those people who do not have access to the Internet.
Ms Perchard: As we understand it from the ONS, 65% of households now have internet access, so it has increased enormously. We do not think the focus on providing information through the Internet is wrong; for the future, that has to be right and the use of the Internet will only grow, but, as we stand now, 35% of households do not have internet access.

Q447 ***Baroness McIntosh of Hudnall:*** Can I stop you for one moment there because one of the more interesting elements of the statistics that you supplied was about who the people are who come to you. Would you anticipate, or do you know, that those people are disproportionately represented in that 35%?
Ms Perchard: Yes, and the last data we have, but they have probably improved, was that 70% of our clients did not have internet access, so it is much less likely for our clients to have internet access.

Q448 ***Chairman:*** The one point though is that, although they may have internet access, it does not mean they know how to use it.
Ms Perchard: Yes, because there are lots of barriers to people using flat information on a screen or a piece of paper. We highlighted the language barrier and whether people can read printed English is different from whether they can speak it.

Q449 ***Baroness McIntosh of Hudnall:*** I am sorry to keep interrupting you, but I just want to focus for a second specifically on the issue of access and then there are other issues about what you do when you have accessed it. There are ways of accessing the Internet which do not necessitate your actually having a computer physically in your own home.
Ms Perchard: Yes.

Q450 ***Baroness McIntosh of Hudnall:*** When people come to you who do not have internet access, what advice do you give them about access to, for instance, public libraries, and to what extent is that a useful part of the network of information?
Ms Perchard: It is certainly a useful part of the network, but, if we are talking about people needing to get access to some government information, and we have provided you with a list of all the government leaflets, the texts of which form part of our information system, very few of the leaflets from the Government on employment rights, for example, are available in hard copy. I think most of us in this room would find it impossible to read and retain the information in the booklet on maternity rights by just skimming through it on a screen and, if I wanted to go and have a conversation with my employer about what my rights were because I am pregnant and I show them what my rights are in a government-produced information item, I would have to print out 96 pages of material because this is not available in hard copy. Public libraries might charge 15p a page, so this is like buying *War and Peace* really if you go down the library to print out your PL958 maternity rights. These are things where really the CAB adviser would be saying, "Here is the information you need. I'm giving you the information that the Government has produced about your rights in this situation", and people will want to go away and study it. One of the things that we discuss in our evidence is that this reliance on the Internet as opposed to hard copy has perhaps created a new dependency amongst some

people or a disempowering effect in that they have got to go to see someone and get them to get the information which they can take away and study, which they might just have been able to pick up themselves in a public place, so it is more than just a 'who has got internet access' exclusionary effect, but it is about ease of access for people to what really are quite large pieces of information and complex because the law is complex and individuals' rights in a situation may be complex. We found particularly on the employment leaflets, but many others, that it is very helpful to give to an employer, "This is what the Government has produced about this" because it has then got that official backing, and to turn up with a photocopied piece of printout that you got down the library has less of a sort of official feel to it. I know it is a bit vague to talk about it in that way, but the drive to Internet only, get rid of paper, which is totally understandable in cost terms, reaches some people who were not being reached and everything is up-to-date all the time, but it does have the effect that there are some groups, who may indeed be the ones who need it the most, who find it the most difficult to get hold of the information they need at the right time.

Q451 ***Baroness Eccles of Moulton:*** You have already covered quite a lot about the government information campaigns and the difficulties you have with getting information in time and that it is impossible for you to join in with the discussion, as it were, while the departments are doing their plans. Are there any other changes to legislation in communication campaigns where you think the Government could involve you earlier and generally make the service you can then provide to your public better and to an improved standard?
Ms Perchard: I was thinking about this and in our written evidence what I suggest, particularly for benefits and tax credits where Parliament has decided, on the initiative of the Government, that there is going to be some financial help available to particular groups in society, the measure of how effective the communication operation is should be how many people actually use it, how many people step forward and claim these benefits, how much money is going into the pockets of people who are intended to be helped. Rather than us just simply being a channel for comms that government departments have come up with, and rather late in the day, what would be really nice is if, every year when the benefit take-up figures were being analysed in DWP, we had a conversation with them about what could be done to get the £3 billion of pension credit, which is going unclaimed at an average of £25 per week, into the pockets of pensioners, and we could craft a shared strategy for getting more people that money. I am afraid that just does not happen. It would be a different way of working, it would require more openness and a partnership between the Government and those who are more trusted and able to approach those who are not responding to other methods to get them the help that they are entitled to, and that could work in many other areas, but, unless the Government is really, really trying to improve take-up and really has a target to improve take-up, that is unlikely to happen, but that is really the sort of thing we would want to be involved with because that is good stuff, that is government services making a difference.

Q452 ***Baroness Eccles of Moulton:*** Would you say that statistics of take-up have altered over the last 10 years, that there are fewer people able to take up the offers?
Ms Perchard: I would have to have a look at the last 10 years. I think the pension credit figures seem to be pretty static over the last couple of years, the take-up is not increasing, and in fact I think on some things there were some slight reductions on last year, but I would need to have a look over 10 years. Obviously, there have been a lot of changed products since then.

Q453 ***Chairman:*** On that, has any government department ever approached you in advance of some initiative they were taking to ask you for your comments and advice on the way they were going to go about presenting the information?
Ms Perchard: Only very occasionally and in small scale really.

Q454 ***Chairman:*** It seems to me you would have quite a contribution to make.
Ms Perchard: Yes.

Q455 ***Chairman:*** You must deal with all the misunderstandings and all the problems of people who have not quite understood what it was that was being said to them before, so you could be a very valuable source of advice, as you are already at the sharp end on that and without an axe to grind.
Ms Perchard: We have had some good experiences of working with HMRC in a small area of their business where they support the voluntary sector. They sponsored a variety of innovative, small-scale initiatives on tax credit take-up, working with migrant workers and ethnic minorities.

Q456 ***Chairman:*** But it is something where you definitely have a role you can play.
Ms Perchard: Yes.

Q457 ***Baroness McIntosh of Hudnall:*** If I can pick that up and take it further, you have mentioned HMRC as having had at least one good initiative where you were pleased with how they developed

their communication. Are there other departments where the provision of information is particularly good, to concentrate on the positive, and, as between the departments where there is good information coming to you, what are the features that they have in common and what are the elements that make it work?

Ms Monroe: I consulted my colleagues about whether they had any favourite government websites, and actually we were at a loss to come up with any: we could not identify outstanding ones. Our comments are largely limited to websites because, as information producers, that is what we are primarily using, so I am not representing the public or the clients of Citizens Advice in that comment really. However, I can identify some things that are better on some websites than others. HMRC, for example, for the purposes of the Information Department, has a very useful list of discontinued leaflets, and that list includes information about what those leaflets have been replaced with, although I absolutely support Teresa's previous comments about our complete dismay at the reduction in hard-copy leaflets. However, one of the things that we do need to know is when leaflets are withdrawn, and it is very difficult to find out that information. HMRC, for example, has a running list, and that information is easy to find. It also has, I think, a better search engine than some websites. It is more user-friendly and, when you search for a term, it comes up with a recommended document. The search on some websites, as I mentioned before, is quite unfathomable.

Ms Perchard: I was thinking about things that have been successful and things that could have been more successful in terms of initiatives which have an element of communication and, on the success ones, where there has been a strong sort of local, on-the-ground involvement, particularly CAB involvement, they seem to be more successful. There was the Partnership Challenge Fund, I think it was called, which DWP ran, funding lots of local initiatives by bureaux, other advice agencies, Age Concern and local councils, trying to improve pension credit take-up, but it only ran for about 18 months to two years because it was a project. It was feeding into national goals to improve pension credit take-up, but devolving the delivery to local initiatives where councils and charities work together to go out and talk to people to get them to claim. The initiative to tackle illegal money-lenders led by the Department for Business, Enterprise and Regulatory Reform is giving resources to local Trading Standards who are setting up confidential helplines for people to report illegal money-lenders, and it is reaching people who are hard-to-reach in a way that is local and using trusted sources and people who know the geography and know the local area. Those sorts of campaigns, which are communication and action, seem to me to be the ones that work the best.

Q458 ***Baroness Howe of Idlicote:*** I will pursue the same line because I think you have already gone over quite a lot of the evidence. You have pointed out a number of successful campaigns with localism and so on which are very good, but what about campaigns that you have identified as having failed? Can you give some examples of those and any indication of why you think they failed?

Ms Perchard: Off the top of my head, there are three that I have had some involvement with. On the child trust funds, there is still quite a way to go, I think, in getting everyone to utilise their vouchers. I think that really needs to be sustained, it needs to be sustained initiatives, but also it needs to make use of local agencies as well. We did a very small-scale project with HMRC to go out in the community and talk to people about whether they had used their child trust fund voucher and it was highly successful, but it has not been mainstreamed as an activity, so the comms on CTF are really sort of large-scale splurges every now and again of advertising and financial firms also doing marketing and promotion, but there are still quite a lot of people who have not used the vouchers. There are a variety of helplines in government, particularly one called 'Keep Warm, Keep Well', which I think might bear some looking at about the actual take-up versus the costs, and I think it is remoteness often which means that those people who are the hardest-to-reach and have very busy lives just do not engage.

Q459 ***Baroness Howe of Idlicote:*** Do you in fact think that the Government have learnt any lessons and have actually studied why they are failing themselves?

Ms Perchard: On the communications, helplines and websites, the Varney Report, *Service Transformation*, is really the key text on learning lessons about how to reach the public better. It identifies how many separate contacts individuals need to have with parts of government to do things like report a death. As we said in our evidence, we sincerely believe that at the senior level in government they really want to do something to simplify this, to make it better for the citizen, but it is enormously challenging to make all government services work as though they are one system facing the individual.

Q460 ***Baroness Howe of Idlicote:*** Are you really advocating one template that would work across all departments?

Ms Perchard: I do not want to sound too jargony, but there are sorts of clusters of an individual's engagement with government services which, if they were brought together more, would make sure people got what they were entitled to if they were simpler and better, and the benefits and tax credits piece would be good.

Q461 ***Baroness Howe of Idlicote:*** I want to come on again to the tax credits scenario, but it is very interesting that the Government itself has given three examples of what it thinks of as a successful campaign: car crime reduction; smoking cessation; and road safety. They are there in their evidence, which arrived rather late. That aside, it is perhaps interesting, you have mentioned already the various benefits, but is it to your knowledge that they have tried to communicate the rights in any way successfully because there are, as you point out in your evidence, huge percentages of claims that have just not been claimed? Surely, that is a massive failure, so what have you tried to do about it and how have they reacted?
Ms Perchard: On things like smoking cessation, there was a major change in law when pubs and restaurants were going to be breaking the law if they allowed people to smoke, so there were a lot of other actors in this area on smoking in public places having a pressure on people, and, with car crime, presumably insurers are providing some market messages and it is not just the Government that is bringing about change in these areas. I think on the benefit take-up piece, what we tend to see is small initiatives which then are not sustained and followed through. This month, there are changes introduced to housing benefit and council tax benefit to reduce the period of time over which a previously unmade claim can be backdated. We come across people who have failed to make a claim, have housing arrears and council tax arrears as a result, and actually the backdating provision enables us to get the debt cleared, the local authority is very happy as well and people have a fresh start. It is often elderly people, people who need their affairs managed for them, who miss out on claiming. The period for backdating was coming down to three months for everybody, but the Government did not do anything to alert people to the need to get in claims before this date came in. There was one piece of news initiative from the Minister in *The Sun*, "Older people, please claim", which went out earlier in the summer, but it was not followed through with anything on the ground locally or from a trusted source, it was just one piece of media communication. It is something we have been campaigning on all over the summer, to get people to claim these benefits, and it is about lack of sustainment often as to why a government campaign may not be effective because it is all round a moment in time or the point of introduction of something and the energy to keep on working at it seems to dissipate.

Q462 ***Baroness Howe of Idlicote:*** But, pressing you a little bit further, the work that the CAB does is exceptional and I am certainly not being critical in any way of what they are doing, but the very fact that there is only a 50% take-up of housing benefit for households who work and only a 22% take-up of working tax credits for households without children, that is an appalling, an appalling figure.
Ms Perchard: Yes, it is.

Q463 ***Baroness Howe of Idlicote:*** Under those circumstances, have you been trying to press the Government to do better? Are they following through and seeing how inadequate their attempts have been and have they learnt from their mistakes, if you like?
Ms Perchard: Yes, we have. I think about three years ago we developed a tax credits take-up campaign to be delivered by us and other local charities, and we worked with one-parent families on that. We were supported financially in the costs of producing that campaign by HMRC, and were very pleased to do so, but it has never got up to the scale to really reach the hundreds of thousands of people that need to be reached, so by taking these initiatives of coming up with proposals, going to HMRC, saying, "Can we do something about take-up?" at a time when actually people are saying, "There isn't a problem with take-up because look at how many million people are on the system", we do try to take the responsibility to get a solution. We are not just passively sitting back; we want to get out there and get people claiming these things as well.
Chairman: We shall have to draw this to a close, but perhaps I can ask one last question, and this is your chance, on behalf of all of your volunteers. There must be one government department that drives you mad, there must be one government department that is a big mire, so this is an opportunity for you to do something for your volunteers to say, "Why didn't somebody say something about the problems of getting information and communication about that issue?"
Baroness Howe of Idlicote: And which is the best.

Q464 ***Chairman:*** We have had some good examples, but there are people sitting here, saying, "Why didn't she tell them about the problems we have in getting information in this or that area?" Which one?
Ms Perchard: Well, setting on one side the utilities, because they are not part of government, but they give us a lot of gyp actually, the utility call centres, I think it is probably the tax credits system, the helpline and everything else that goes with it.

Q465 ***Chairman:*** Which comes under HMRC, who otherwise have a pretty good crit from you?
Ms Perchard: Yes, at the policy engagement level, actually they are the most sophisticated in terms of their relationship with us. Some of their support for

the voluntary sector and how they do that is really good compared to others, and we often hold that up as an example. We have a much smaller volume of tax credit enquiries to other benefit enquiries, but they take a very long time. They have improved, it has got a bit better and it has improved over time, it is not as bad as it used to be, but it is incredibly complex, it is the complexity of it.

Q466 ***Chairman:*** Well, that will be noted and hopefully that will help to lead to an improvement. We are only here to help! Thank you very much indeed for coming. If we have other points that come up, perhaps we could write to you.
Ms Perchard: Please do.
Chairman: Thank you very much for the trouble you have taken and for being with us today.

Memorandum by the Cabinet Office

1. This memorandum outlines: a history of government communication; the Government Communication Network; the role of the Central Office of Information (COI); special advisers; and how the recommendations of the Phillis review have been implemented through raising professional standards, supporting delivery, communicating directly to the citizen and at a regional level and changes to the release of statistical information.

2. Attached is Annex prepared by the Ministry of Justice covering the implementation of the Phillis review's recommendations on Freedom of Information.

Introduction

3. All government communications activity is subject to strict propriety guidance, which, along with the Civil Service Code, defines how civil servants can properly and effectively present government policies and programmes.

4. The following basic criteria have been applied to government communications by successive administrations. The communication:

- should be relevant to government responsibilities;
- should be objective and explanatory, not biased or polemical;
- should not be—or liable to be—misrepresented as being party political; and
- should be conducted in an economic and appropriate way and should be able to justify the costs as expenditure of public funds.

History of Government Communication

5. The first government publicity unit was set up in the 1850s by the Post Office (then a government department). Its first wide-scale publicity campaign was carried out in 1876. A million handbills were issued to alert the public to the virtues of government savings scheme, life insurance and annuities. During the Great War, 1914–18, the Government invited Fleet Street editors to join its Information Advisory Committee and the Home office opened an Information Bureau. In 1918 Whitehall's various units were consolidated into the first Ministry of Information, the responsibilities of which were dispersed around Whitehall soon after the war ended.

6. In 1919 the Air Ministry was the first department of state to be set up with its own press office. In the 1930s and 40s departmental press offices moved from answering queries to a more proactive information policy with the first Chief Press Secretary being appointed to Downing Street in 1932. The second Ministry of Information was set up in 1939 to mobilise opinion and help the war effort. By 1944 the Ministry had 7,600 staff and a further 1,700 staff with similar duties were employed by other departments elsewhere.

7. After the war the Government decided that there was no further need for the Ministry. In 1946 the Central Office of Information (COI) was set up as a non-ministerial department—the status it has today. The Information Officer class was set up in the 1940s and the Director-General of the COI took on the role of Head of Profession as part of his duties. Up to the mid 1980s the COI was funded by the Allied Vote. Departments wishing to run publicity campaigns sought the help of COI where the expertise lay. In the 1980s the funds were devolved to departments and the COI became a trading fund under the Next Steps initiative. Also during this period the Information Officer Management Unit was set up to support the recruitment and assessment of

government communicators and the Head of Profession role moved away from COI and was appointed by the Cabinet Secretary with the approval of the Prime Minister.

8. In 1997 the Mountfield report recommended improvement in the co-ordination and consistency of communications across government and enhance its capacity to operate in a 24 hour world. It recommended that the Government Information Service should be renamed the Government Information and Communication Service—to reflect the proactive exposition and justification of policy rather than the reactive answering of questions.

9. The Phillis review was commissioned in 2003. It called for a redefinition of government communication into a more customer-focused dialogue with the public based on a strategic pan-media approach. Among its recommendations was the recruitment of a Permanent Secretary for Government Communication and a new network for all government communicators—the Government Communication Network (GCN).

The Government Communication Network (GCN)

10. The GCN was established in January 2005. It is a virtual network linking all professional communicators within the UK civil service. It supports them in gaining the skills and knowledge they need to carry out their duties.

11. The GCN is open to all civil servants whose role includes communication. These individuals participate in a broad range of activities to help build dialogue with government audiences—not just media relations. Individuals are based in mainstream Whitehall departments as well as the Scottish Government and the Welsh Assembly Government and in a variety of government agencies such as the Health and Safety Executive and the Food Standards Agency.

12. The network is supported by a small team working for the Permanent Secretary, Government Communication. They provide the network's members with a best practice framework for communicators called Engage, a programme of events, courses, support to professional and regional network groups, advice and guidance on best practice, propriety, professional development and recruitment.

13. There are 22 professional networks within GCN whose purpose is to discuss and share best practice on a specific discipline or subject. The GCN also supports seven regional networks. These have been good platforms for sharing best practice and helping to embed the Engage programme.

Numbers of Government Communicators

14. Each government department, agency and NDPB is responsible for setting its own communications division's structure and staffing levels, priorities and outputs—and the Secretary of State is responsible to Parliament in the normal way.

15. In its original report Phillis said that there were around 2,600 people working in communication directorates but that only 850 were GICs, (GCN's predecessor) members.

16. Civil servants are proactively encouraged to register with GCN website if they consider all or part of their job to include communication. This is dependent on individuals updating their own details; therefore the current registration figures do not give an accurate picture of the community. In order to build an accurate picture of government communicators the team that supports the GCN is currently reviewing the criteria for full registration with the network.

17. Individual departments and organisations provide details of their communications contacts for the COI's White Book. The figures provide a snapshot in time, and do not always include a Department's entire communications directorate.

18. The White Book is a directory of communications staff working in a wide variety of disciplines from internal communications to media relations, digital media and stakeholder engagement, as well as administrative support staff. It covers a range of government departments and agencies, including those of the London, Scottish, Welsh and Northern Ireland Assemblies, and regulators. Staff in public sector organisations such as the TUC, CBI, Metropolitan Police, Association of Chief Police Officers and the BBC are also included in the book.

19. The most recent edition of the edition of the White Book (September 2008) contains around 3,158 entries for government and its NDPBs. The January 2004 edition of the IPO Directory contained around 2,942 entries.

20. There were approximately 373 press officers in central Whitehall departments in September 2008. In 2004, there were 330 press officers. These figures do not include support/admin staff and vacant posts or the Government News Network (GNN).

Permanent Secretary, Government Communication

21. Howell James was appointed as the first Permanent Secretary, Government Communication in July 2004. He stepped down in June 2008. The role is the head of profession for government communicators and as such has to lead government communicators; improve the co-ordination of cross-departmental issues; and build the abilities and capabilities of communicators within every government department.

22. The acting Head of Profession for government communication is Alan Bishop, Chief Executive of the Central Office of Information. An open competition for the recruitment of the new Permanent Secretary is currently underway.

The Role of the Central Office of Information (COI)

23. The COI is the Government's centre of excellence for marketing and communications. It's Chief Executive, Alan Bishop, reports to the Minister for the Cabinet Office who sets COI's annual objectives for efficiency, quality and financial performance.

24. COI provides consultancy, procurement and project management in every area of communications and strives to achieve best value for government in each of its service groups. COI continues to leverage their strong centralised buying position for advertising, enabling them to secure significant savings for government departments. In 2007/8 they secured 47.7% reduction in media costs measured using recognised industry benchmarks (average price paid for TV airtime and rate card costs elsewhere). These results were independently audited.

25. COI as a trading fund recovers all of its running costs from "clients" across government. Government bodies are not mandated to use COI which gives COI additional incentive to produce first class service. It employs approx 630 permanent staff on a full time basis. Staff numbers vary from year to year according to which services it is required to support eg the regional news network was transferred from Cabinet Office to COI in 2005.

Maintaining and Raising Professional Standards

26. The key focus for GCN and the Permanent Secretary, Government Communication is on raising professional standards in government communications. It does this through a number of routes:

Our People

27. All vacancies for communications posts are advertised—either through an internal or external competition, unless there is an internal managed move. There are strict rules of appointment, which are adhered to across Government. The Permanent Secretary, Government Communication is involved in all senior communications appointments and where relevant the Civil Service Commissioners.

28. Since Phillis the structures that underpin the recruitment and skills development of communication staff in government have been overhauled and enhanced.

29. In March 2007 a professional skills framework was launched for government communicators. This identified the specialist skills needed in our people to bring the Engage programme to life across government, as well as reflecting the latest developments in the wider communication industry. The framework is used for recruitment into roles for professional communicators and their personal development.

30. Individuals working in government communications are also supported with Evolve—an online personal development tool, drawn up in line with the professional skills framework. Evolve supports staff and managers to agree development priorities helping to raise standards.

31. The GCN works in partnership with a number of professional bodies, leading communication specialists and the National School for Government to deliver a range of communication skills training products. These range from an introduction to communication in government to the development and use of behavioural insight when communicating with the public. These products have been invaluable in developing the communities understanding and application of the Engage framework.

Engage

32. Engage is the best practice strategic communications framework for government communicators. The programme was launched in April 2006 and was designed to help government communicators put the public at the heart of their communication—in line with the recommendations from the Phillis Review.

33. Engage is a framework to help government communicators understand and apply a range of advanced strategic communication techniques and tools, seeking more effective ways of shifting attitudes and changing behaviours. It has four key elements:

- Consistent planning process—best practice communications planning model and guide.
- Eight key principles including a primary focus on developing audience insight, audience segmentation and media neutral planning.
- Enablers—the key skills required for continuous improvement.
- Glossary—establishing a common language and understanding of terminology.

34. The GCN team promote understanding of the programme through a number of channels: the GCN website (featuring best practice guides, case studies, tools and templates); professional development courses; seminars and GCN regional and professional networks.

35. The GCN team is developing the programme to support policy colleagues in developing behaviour change policy initiatives and further products to support the communications disciplines.

36. In 2007–08 research of the GCN members showed:

- 89% awareness of the Engage programme, 61% unprompted; and
- a significant increase in adoption of the principles of Engage personally (57%) and by working group (48%).

37. Work continues to embed this best practice model within the community and it forms the backbone of all the network's training and development products. The Engage programme was a finalist in the 2008 Marketing Society, Marketing Effectiveness Awards.

The Government Strategic Marketing Advisory Board

38. The effectiveness of Government marketing is monitored by the Government Strategic Marketing Board (GSMAB) whose aim is to ensure that the taxpayer gets value for money.

39. The Government Strategic Marketing Advisory Board replaces the Advisory Committee on Advertising (ACA), following its recommendation that its role needed to evolve to better reflect the changing way in which government communicates with the public. Government now uses a much broader range of marketing tools and advertising is not the sole channel of paid-for communication.

40. John Mayhead, a senior marketing professional, chairs the board which met for the first time in February 2008 and meets on a quarterly basis.

41. GSMAB monitors all government marketing activity. Its objectives are to:

- provide independent validation that strategic marketing across government departments, including COI's contribution, is effective, transparent and efficient;
- help government ensure best value for the taxpayer in its development and purchase of communication products and services; and
- serve as an independent body and formal mechanism for the exchange of ideas and discussion of issues related to:
  - improving the efficiency and effectiveness of strategic marketing across government; and
  - creating a partnership between key stakeholders to improve the effectiveness of marketing across government.

Behaviour Change and Strategic Marketing

42. To develop further best practice in marketing and communications delivery we are considering the role of communications in effective behaviour change programmes. The behavioural issues government has to address consist of multiple underlying factors, which are often very different and significantly more complex than those encountered in the commercial sector. Successful behaviour change programmes (see car crime

example from the Home Office, paragraph 47) require integrated input from a range of disciplines including communications.

43. The Government Communication Network through the Engage Programme and Central Office of Information through its Common Good research programme are developing robust techniques and tools that can be used across disciplines and the Engage model will be adapted to reflect the relevant outputs of this project. GCN and COI are working together to ensure there is no duplication in this field.

Expenditure on Marketing

44. Over the years the level of marketing spend has varied significantly according to changing public expectation and to how active the government is. Phillis recommended "more direct, immediate communication to the public" using skills which will include "paid for advertising". The government's expenditure through COI is published in COI's annual report and a copy of the report for 2007–08 is enclosed for the committee.

45. The Phillis Review observed that they were not able to assess the total expenditure across government on web communication. The *Public Accounts Committee Report 16: Government on the Internet* recommended that the Chief Information Officer (CIO) Council should agree a methodology for identifying the costs of websites. In the government's response July 2008, the Cabinet Office accepted this recommendation and COI is working with departmental representatives and the CIO Council on the consistent identification of website costs. Departments will start to measure them in April 2009 and report annually thereafter to COI. They will be published in the Transformational Government Annual Report.

Supporting Delivery

46. Government communicators and the campaigns they work on play a crucial role in supporting policy and operational colleagues in the delivery of important policies. Three examples are outlined below.

Home Office—Car crime reduction

47. This highly successful campaign was developed on Engage principles. It used regional broadcast media and communication at point of risk (petrol forecourt point of sale and parking ticket machines) to convert awareness to action. The campaign evaluation results are impressive. Agreement that "most vehicle crime is opportunistic" and "there are things I can do to reduce my own risks" increased by 19% and 24% respectively. Independent econometric analysis estimated that, after the changes in modelling crime were taken into account, thefts from vehicles fell by 14% over the period and theft of vehicles fell by 23%. They estimated that half of this decline was due to the campaign and that the campaign resulted in £110 million saving in vehicle crime.

Department of Health—Smoking Cessation

48. The Department of Health is adopting a strategic marketing approach based around audience insight and modelling to contribute towards the PSA target relating to smoking amongst routine and manual smokers, which is to reduce prevalence rates to 26% or less by 2010. The strategy is grounded in behaviour change theory and best practice social marketing principles. The marketing programme draws from a wide range of initiatives (including direct marketing, customer relationship marketing, face to face marketing, stakeholder engagement and partnerships), rather than just relying on mass market advertising-driven approaches, and plans are based on newly uncovered insights about routine and manual smokers. The advertising effect has been significant with 25% of smokers saying that advertising prompted their most recent quit (February 2008).

Department for Transport—THINK!

49. The Department for Transport's THINK! road safety campaign puts out important messages on drink driving, speed, seatbelt usage and motorcycle safety. The department is on course to meet the 10 year casualty reduction targets by 2010 (targets are 40% reduction in number of people killed and seriously injured, and 50% for children). The annual campaign spend for 2007–08 was £17 million. In 2002 when DfT was formed campaign spend was £11.7 million.

Communicating Directly to the Citizen

50. The drive behind the Engage programme is to focus on the needs of citizens in order to deliver policies and services that meet them more fully. Innovative tools such as insight generation and journey mapping are now being used widely to inform policy development and improve the total citizen experience.

51. Phillis was clear on the need for the government to embrace new ways to connect with the public, and recommended that the government explore the opportunities offered by the internet.

52. One of the suggestions was for a single point of access online for citizens. Launched in 2004, Directgov (direct.gov.uk) offers information and online transactions (such as renewing your car tax) from 18 departments in one accessible website. The website is designed from the user's perspective, rather than being set out departmentally, and is one of the best examples of a cross government service. As the site is structured from the point of reference of the user, people no longer need to know the structure of government to know how to find information that might have previously been found on several different government websites. For example, Directgov allows parents to find up-to-date information about having a baby, preschool, adoption and fostering, money and work—everything they need to know all in one place. In 2007, over 9 million people renewed their car tax online, one of the most successful online public services in the world.

53. The principle of focussing communications on the needs and behaviours of the audience is a key element of the government's online strategy. Ministers approved the principle of having only three main "public" websites—Directgov, Businesslink.gov.uk for businesses, and NHS.uk for access to NHS services. Only core Departments will retain a smaller, more focussed website for online interaction with their stakeholders.

54. This approach is now a fundamental principle for government online. COI is leading a cross government drive to reduce the overall number of government websites and to drive up the quality and consistency of information and services on government websites. A reduction of half of all central government websites, some 1500 at least, was made in 2007 and further progress will be announced this year.

55. Investment has been made in improving the skills and experience of the government e-communications community, who now offer highly specialised advice and support to their Departments in areas as diverse as consulting with the public and the reduction of infrastructure costs. It has been critical to ensure that the government does not lag behind the private sector by staying abreast of developments in web technology.

56. However, it is often more effective to communicate with our audiences in their own online communities. Department's campaigns now regularly use social networks to connect with audiences, especially the young. One example is the FRANK instant messenger service which allows young people to get instant online answers to questions about drugs, whenever they need them. The MSN bot has been downloaded 160,000 times since March 2007. As part of its life without limits recruitment campaign, the Royal Navy created a profile page of Lt Brendon Spoors, a pilot, on Bebo.com to engage 16–24 year olds by describe daily life in the Navy and answering their questions.

57. The No 10 e-petitions site has encouraged citizens to raise their concerns directly with Government. Over 29,000 petitions have been submitted with 5.8 million signatures in total.

58. Another method of involving the public more closely is through deliberative consultation. Departments have conducted several major deliberative consultations, where people have an opportunity to comment directly on future government policy. These have covered issues such as pensions and the future of the NHS. The Department of Health's "Your health, your care, your say" was the largest deliberative consultation of its kind, engaging over 100,000 people in future health policy.

Regional Communication

59. The Government News Network (GNN) which provided a regional press office service to government departments was moved to COI in 2005 to ensure regional activity was integrated into the broader communication mix and was not solely focusing on news. The service was significantly restructured within COI in the early part of 2008 to reduce financial losses and to provide a more integrated service with public relations to support Government campaigns, enabling COI to provide a full mix of marketing communications required by departments. This has also seen a move away from the "pay as you use" model towards a subscription model.

60. The regional network of COI offices is wholly financially dependent on commissions from individual government departments and that determines the nature and scope of the work undertaken. COI News regional offices have extensive networks with the regional media and stakeholders. This is utilised for cross-government working through the regional resilience.

61. In addition, the way that departments deal with the regional media is changing. Many departments now have dedicated regional press officers who work closely with regional media on issues of importance to the local area. They are responsible for working with national colleagues to deliver key information around rights and responsibilities. One example is at HMRC where a team of 45 members of staff volunteer to be Local Radio Broadcasters acting as spokespeople on local radio answering questions on all aspects of HMRC operations from filling in a self assessment to paying the national minimum wage. Last year they delivered over 1200 broadcasts on 200 different radio stations obtaining 300 hours of very valuable free airtime to huge audiences.

Briefing the Media

62. There is a twice daily lobby briefing hosted by Downing Street in the mornings and the lobby in the House of Commons each afternoon, apart from Fridays. In keeping with the Phillis report these No 10 hosted lobbies are open to any media and have been moved out of Downing Street to a neutral location. The Prime Minister's spokesman is a permanent civil servant.

63. All lobby briefings are off camera, but on the record, and a record of the briefings is published on the Prime Minister's website the same day. This includes briefings given on foreign visits.

64. The Prime Minister's monthly press conference in Downing Street is open to lobby and foreign correspondents. These are televised and last around one hour. Recently this has included joint briefings with Ministers including the Chancellor and Hilary Benn. A full transcript is published on the PM's website.

65. Digital communication direct to the public is constantly being strengthened. Recent innovations include: "Ask the PM" with Google, where members of the public are able to post films for PM to answer; Twitter (where we are the first Government to have a presence); over 30 webchats direct with Cabinet Ministers over the last two years and we are increasingly looking to use social networking sites too.

The Office for National Statistics and Official Statistics more Generally

66. Since the publication of the Phillis review significant improvements to the way statistics are released are now in the pipeline. The Government has introduced far-reaching statistical legislation in the form of the *Statistics and Registration Service Act 2007* which came into operation on 1 April 2008. The Act created the United Kingdom Statistics Authority (known, legally, as the Statistics Board) which is a non-ministerial department with responsibility for promoting and safeguarding the production and publication of official statistics that serve the public good, wherever produced. Under the Statistics Act, the Office for National Statistics has now become the Authority's executive office.

67. One of the Authority's main statutory duties is to publish a Code of Practice for Statistics; assess whether official statistics comply with this Code; and, if so, designate them as "National Statistics".

68. The UK Statistics Authority's new Code of Practice for Statistics—which is currently subject to pubic consultation—will reinforce the existing requirement that the release of all official statistics should be pre-announced one year ahead, with the exact date of release announced either six months ahead (in the case of market-sensitive statistics), or one month ahead (in the case of other official statistics). These requirements are already met through the "Pre-Release Calendar" which can be accessed via either the Authority's website, or the Office for National Statistics' website.

69. As part of its statistical reforms, the Government has now placed the *Pre-Release Access to Official Statistics Order 2008* before Parliament. Assuming parliamentary consent, this Order will introduce tighter rules governing pre-release access to statistics in their final form. One of the key reforms in this Order involves a reduction in the period of pre-release access given to UK Government Ministers from the current limits (40.5 hours for market sensitive statistics, or five days for non market-sensitive statistics) to a common maximum of 24 hours. (The Scottish Government, however, intends to implement a separate Order which is likely to retain the existing limits).

70. As with the primary legislation, both Orders will apply to all official statistics produced by each administration but the UK Statistics Authority will only assess compliance in relation to statistics which are either, already designated as "National Statistics", or which have been proposed by Ministers as candidates for such status.

71. Both Orders specifically prevent Ministers from disclosing statistics before they are published. If, however, Ministers need to employ the statistics in public before they are due to be published, Heads of Profession for Statistics have the option of bringing forward a pre-announced release date, but with the proviso that users are given sufficient notice of any change.

Special Advisers

72. At 17 September, there were 74 special advisers in post of whom 13 were employed primarily in the area of communications, including in No 10. Successive administrations have used special advisers to brief the media.

73. Special advisers are required to conduct themselves in accordance with the *Civil Service Code* except for those provisions relating to impartiality and objectivity.

74. The *Code of Conduct for Special Advisers* includes a section on contacts with the media. The *Code* makes clear that special advisers are able to represent Ministers' views on Government policy to the media with a degree of political commitment that would not be possible for the permanent civil service. The *Code* also makes clear that special advisers' contacts with the media should be conducted in accordance with the *Guidance on Government Communications*.

14 October 2008

Annex A

MINISTRY OF JUSTICE: FOIA EVIDENCE

This document gives an overview of the implementation of the Freedom of Information Act (FOIA) since it came into force in January 2005 and responds to the FOIA recommendations outlined in the Phillis Review of government communications 2004.

Introduction

The Freedom of Information Act is a landmark piece of legislation, which enshrines for the first time in law the right of access to official information.

The Act gives any person the legal right to ask a public authority subject to it for recorded information that they hold. Subject to the application of any of the appropriate exemptions, this information must be provided to the requester.

The Act applies to over 100,000 public authorities, including government departments and local assemblies; local authorities and councils; health trusts, hospitals, schools, colleges and universities; publicly funded museums, the police and many Non-Departmental Public Bodies, committees and advisory councils. The volume and diversity of the information requested from these public authorities reflects the issues that affect people's lives and is evidence that genuine access to information matters to those who use public services.

Since the Act came into force on 1 January 2005, central government monitored bodies have received more than 30,000 requests each year and requests to public authorities in the wider public sector exceed 87,000 per year.

The Act has provided unprecedented access to information held by government and a diverse array of information not previously disclosed has entered the public domain. This has included information on communications and campaign research, departmental board and senior management meeting minutes, some ministerial meetings, funding schemes and agreements, staff salaries and expenses, gifts and hospitality received by departments and procurement strategies. For monitored central government bodies, each year the percentage of resolvable requests in response to which the information sought is released in full has consistently remained around 60% and in a further 10–15% of cases, some of the information sought is released.

The Government shares the Phillis Review's view of the importance of FOI in making government at every level more accountable and supporting active citizenship. That is why in October 2007, the Prime Minister announced that the FOI fees regime would remain unchanged, citing "the risk that such proposals might have placed unacceptable barriers between the people and public information". At the same time, the Prime Minister announced that the government would consult on extending the Act to cover not just public authorities, but those organisations carrying out functions of a public nature too. The MoJ has also begun a programme of work, "Better FOI", to improve how FOI is delivered across central government.

Recommendation 8.1: Announce publicly that Ministers will not use the right of veto.

The government's own FOI White Paper stated that a governmental veto would undermine the authority of the Information Commissioner and erode public confidence in the Act.

Under section 53 of the Freedom of Information Act, in certain circumstances, a Cabinet Minister (or the Attorney General) can "veto" a Decision Notice or an Enforcement Notice issued by the Information Commissioner or the Information Tribunal, meaning that the notice ceases to have effect.

To use the section 53 veto, a Cabinet Minister (or the Attorney General) must issue a certificate to the Information Commissioner, certifying that on reasonable grounds he or she has formed the opinion that the balance of the public interest favours non-disclosure of the information covered by the notice, or part thereof. The Minister must then lay a copy of the certificate before each House of Parliament. By using the veto, the Minister effectively substitutes his view of the public interest for that of the Information Commissioner or Information Tribunal. Any use of the veto could be challenged by way of judicial review.

The veto power was introduced in the House of Commons during the passage of the Bill in 2000, and was a counterbalance to an amendment allowing the Information Commissioner to order—rather than recommend—the disclosure of information in the public interest.

At the time, the Government gave commitments that use of the veto would be exceptional and that any decision to exercise it would be taken with the benefit of a collective decision from Cabinet. Parliament judged it right to provide such a power in the Act, for use as a last resort. In doing so, Parliament acknowledged that there would be exceptional circumstances in which only a Cabinet minister, who is ultimately accountable to the public, should make the final decision on the balance of the public interest.

Recommendation 8.2: As far as possible replace the class exemptions, including the exemption which restricts disclosure of the analyses on which policy is built, with a harm test.

Actual policy advice, we accept, needs to remain confidential, at least for a time, to allow free debate within government. But the information and analysis on which policy is built should be in the public domain.

There are 23 exemptions in the Freedom of Information Act, under which public authorities can withhold information if they are deemed to apply. Information that could jeopardise, for example, the country's security interests, defence, commercial interests, law enforcement and health and safety, is exempt from release. In some cases such exemption is subject to a public interest test.

The exemptions perform the vital function of protecting legitimate interests and ensuring a proper balance is achieved between the right to know, the right to personal privacy and the delivery of effective government. It was never intended that the Freedom of Information Act would be a vehicle for unlimited access to information held by government. It is vitally important to enable the continued effectiveness of government that some information is protected.

Safeguards in the Act ensure that the class exemptions cannot be used to arbitrarily withhold information. Many of them—for example section 35 (formulation and development of government policy) and section 42 (information in respect of which a claim to legal professional privilege could be maintained) are subject to the public interest test. Accordingly, information covered by such class-based exemptions can, and has been, released where the public interest falls in favour of disclosure.

Those class-based exemptions which are absolute—ie not subject to a public interest test—represent types of information in respect of which Parliament has decided that there is an overriding interest in remaining confidential, such as information supplied by, or relating to, bodies dealing with security matters.

However, the Information Commissioner and the Information Tribunal have the power to rule on whether public authorities have applied exemptions correctly.

Experience has shown that the exemptions have not inhibited the effectiveness of the Act in enabling greater openness. In 2007, 63% of resolvable requests were granted in full, 13% were withheld in part and 20% withheld in full. This means that all the information requested was provided in response to more than three out of every five resolvable requests.

As was stated by the government during the passage of the Bill through Parliament, a general harm test would not work properly in relation to the entirety of the range of potentially exempt information. For example, its application was considered to be impractical in relation to some categories of information: the disclosure of personal information is governed by obligations to comply with European Community data protection Directive and the European Convention on Human Rights.

The Government is pleased that the Phillis Report accepts the case for actual policy advice normally needing to remain confidential, at least for a time, to allow free debate within government. For its part, the Government has sympathy with the report's contention that the information and analysis on which policy is built should be in the public domain. It believes that statistical and other factual information on which policy is based can generally be released in response to requests, although there may be certain cases in which exemptions do apply to this material.

Recommendation 8.3: In practice, apply the same level of harm test that features within the Scottish FOI Act and the Open Government Code of the Welsh Assembly.

This will permit disclosure of information to be withheld only when it is likely to cause "substantial harm".

Under the Freedom of Information Act, a number of the exemptions are subject to a "prejudice test". To establish whether these exemptions are engaged, a public authority must show that disclosure "would or would be likely to prejudice" the interests which the exemption is designed to protect. The first Information Tribunal case to consider the phrase "would or would be likely to prejudice" was *John Connor Press Associates Limited v Information Commissioner* (EA/2005/0005). The Tribunal held that: "We interpret the expression 'likely to prejudice' as meaning that the chance of prejudice being suffered should be more than a hypothetical or remote possibility; there must have been a real and significant risk". While this is a different test to a harm-based test, this interpretation sets the threshold quite high.

Furthermore, once it is established that an exemption is engaged, public authorities are then required to judge whether the public interest in all the circumstances of the case falls in favour of maintaining an exemption, or disclosing the information. At this point the degree of harm likely to be suffered will often be a highly relevant consideration, one which has to be balanced against the benefit to the public. Public authorities, the ICO and the Tribunal are all used to applying and interpreting this test, which allows for objective consideration of where the public interest lies. The Government sees no case for changing it and has no plans to do so.

Recommendation 8.4: Adopt an all-purpose limit that replies to requests for information under the Act should be met within 20 days.

Section 10 of the Freedom of Information Act requires public authorities to respond to requests for information promptly and in any event no later than the 20th working day following receipt of the request. Ministry of Justice guidance advises that responses should not be delayed until the end of this period if a response can be provided earlier.

The Act contains provisions to extend this deadline under certain, limited circumstances. Under section 10(3), where a public authority needs further time to consider the respective public interest arguments, it may extend its deadline for responding until such time as is reasonable in all the circumstances. However, it must tell the applicant within the initial 20-day period which exemption or exemptions it believes apply to the information requested, and give an estimate of the date by which the decision will have been made. This provision reflects the fact that Parliament recognised there would be exceptional circumstances in which public authorities would need extra time to reach a decision on the balance of the public interest. This might include cases in which a number of qualified exemptions are under consideration, or those involving complex public interest considerations.

In 2007, 84% of requests to all monitored bodies received a substantive response within the 20 working day limit, while 7% of requests were subject to a public interest test extension.

Ministry of Justice guidance to central government departments advises that public interest test time extensions should generally avoid exceeding 20 working days. In 2007, for those requests where a public interest test extension to the standard 20 working day response deadline was applied, 48% were extended for 20 working days or less, while 26% were extended for longer than 40 working days. As part of the Better FOI work programme, the Ministry of Justice is currently working to promote best practice in the use of public interest test time extensions across Whitehall.

Section 10(4) of the Act also provides for an extension to the 20 working days timescale, up to 60 working days, to be made by statutory instrument. This power has been used to address special cases, such as school holidays where schools will not be staffed at that time and when frontline units of the armed forces cannot be reached for operational reasons.

Recommendation 8.5: In complex cases involving significant issues of public interest, remove the £600 limit on the cost of providing information.

The Information Commissioner could act as the judge of whether an application involves a significant issue of public interest.

The cost limit—which establishes the limit of the work a public authority need do in order to satisfy a request—is an important part of maintaining the right balance between handling FOI properly, and carrying on the business of government. The system is in place to ensure that, while the right of access to information is maintained, public authorities are able to deal appropriately with those requests which would impose a disproportionate resource burden, potentially constituting a waste of officials' time and taxpayers' money. The cost limit is currently set at a level that achieves this, and accordingly, government sees no reason to change it.

In 2007, in just under 1,400 cases monitored bodies cited the cost limit as the reason for fully withholding information, this was just 5.6% of nearly 25,000 resolvable requests received.

Under the Act, public authorities also have a duty to provide "advice and assistance" to requesters. This can include assisting requesters to refine requests so that information can be provided under the cost limit. Furthermore, public authorities often provide information outside the framework of FOI where they believe this to be in the public interest.

Supplementary letter from the Cabinet Office

HOUSE OF LORDS SELECT COMMITTEE ON COMMUNICATIONS

Thank you for your letter of 16 October and I look forward to seeing you and your Committee colleagues tomorrow.

I will answer each of the questions in turn as best as I can. But one of the points I think that will come up tomorrow is the fact that Government communications should be an integral part of civil service work. It is therefore very difficult to specify, in the way the Committee has asked, what constitutes "communications" civil servants. It is just as difficult to do this as it would be were the Commons' Public Administration Committee to ask for the number of "policy" and "operational" civil servants, given our aim is to integrate those two functions as far as possible.

There is also the question of departmental autonomy: different departments will organise their business in different ways. Not all the communications functions in a department will be part of a single communications directorate with a single budget for communications. Howell James has already made these points in his earlier evidence to you.

Finally, very few of the figures were recorded in a similar format in 1988, which restricts our ability to compare over time. However, we have been able to give the relevant information for 1998 in most cases.

The attached tables set out the information in more detail in the best available format, with the information most relevant to the request.

21 October 2008

1. The Number of Communications Staff Employed by each Government Department

This is not collected centrally but one guide to the figures is the White Book of Contacts in Government Departments and Agencies, intended as a helpful guide for the press and other bodies. The table below contains the total number of communications staff by central Whitehall departments based on the number of entries in the December 1998 IPO directory and the September 2008 White Book. Figures are not available for 1988.

The White Book figures are only ever a snapshot in time and are not intended to be a comprehensive guide to "communication staff" in the Civil Service.

Department	*December 1998*	*September 2008*
Cabinet Office	23	38
Ministry of Justice	—	77
Lord Chancellor's Department	16	—
Department for Culture, Media and Sport	13	21

Department	*December 1998*	*September 2008*
HM Customs and Excise	10	—
HM Revenue and Customs	—	58
Board of Inland Revenue	17	—
Ministry of Defence	109	255
Department for Communities and Local Government	—	77
Department for Education & Employment	100	—
Department for Children, Schools and Families	—	68
Department for Innovation, Universities and Skills	—	42
Department for Environment, Food and Rural Affairs	—	106
Department of the Environment, Transport and the Regions (including agencies)	87	—
Ministry for Agriculture, Fisheries & Food	42	—
Foreign and Commonwealth Office	40	46
Department of Health	101	122*
Home Office	46	98
Department for International Development	17	24
Prime Minister's Office	14	31
Department of Trade and Industry	82	—
Department for Business, Enterprise and Regulatory Reform	—	London only: 67
Department for Transport (including agencies)	—	105
HM Treasury	18	28
Department for Social Security	60	—
Department for Work and Pensions	—	113
TOTAL	**795**	**1,376**
TOTAL ENTRIES	**1,628**	**3,158**

2. Press Officers

The table below contains the total number of press officers in central Whitehall departments based on the number of entries in the December 1998 IPO Directory and the September 2008 White Book.

The White Book figures are only ever a snapshot in time—thus numbers may differ to PQ answers provided by individual departments at various points in a given year. These figures do not include support staff, vacancies, or special advisers.

Department	*December 1998*	*September 2008*
Cabinet Office	14	11
Lord Chancellor's Department	3	—
Ministry of Justice	—	34
Department for Culture, Media and Sport	8	11
HM Customs and Excise	3	—
HM Revenue and Customs	—	34
Board of Inland Revenue	7	—
Ministry of Defence (Central press office staff only)	12	33
Department for Communities and Local Government	—	21
Department for Education and Employment	27	—
Department for Children, Schools and Families	—	20
Department for Innovation, Universities and Skills	—	13
Department for Environment, Food and Rural Affairs	—	19
Department of the Environment, Transport and the Regions (Central staff only)	32*	—
Ministry for Agriculture, Fisheries & Food	9	—
Foreign and Commonwealth Office (Not including overseas posts)	17	20

Department	*December 1998*	*September 2008*
Department of Health	13	26
Home Office	18	37
Department for International Development	6	8
Prime Minister's Office	8	9
Department of Trade and Industry	22	—
Department for Business, Enterprise and Regulatory Reform	—	16
Department for Transport (Central staff only)	—	13*
HM Treasury	7	8
Department for Social Security	10	—
Department for Work and Pensions	—	40
TOTAL	**216**	**373**

3. Spending on Government Advertising by the Central Office of Information

Information on individual spending by department on communications is not available for the reasons given by the former Permanent Secretary, Government Communications, and reiterated in the Cabinet Secretary's letter covering these tables.

However, spending over time on Government advertising provides some basis for historical comparison of this aspect of Government activity. This is compiled by the Central Office of Information (COI), and reflects only advertising spending on Government campaigns by the COI. The figures are given in cash prices on the right hand column, and adjusted for published prices for the main units for buying media outlets (abbreviated here as media inflation). The difference between this table and other information supplied to the Committee elsewhere is that the other information refers to the total spending by the COI on all its functions—digital communications investment, regional news offices, direct marketing, an increase in the publication of official inquiries for example—whereas this table compares like for like advertising on Government campaigns.

Year	*Spend Adjusted for Media Inflation £000s*	*Cash Spend £000s*
1986–87	183,361	95,800
1987–88	151,945	90,500
1988–89	136,353	86,200
1989–90	147,139	98,400
1990–91	146,592	98,800
1991–92	122,349	83,100
1992–93	67,638	47,000
1993–94	86,403	63,200
1994–95	71,387	55,200
1995–96	77,166	63,700
1996–97	78,599	69,400
1997–98	63,800	59,000
1998–99	108,563	105,500
1999–2000	112,559	113,500
2000–01	184,127	192,400
2001–02	148,187	150,200
2002–03	140,328	145,900
2003–04	173,134	178,200
2004–05	177,482	184,900
2005–06	164,547	167,900
2006–07	155,024	154,700
2007–08	167,600	167,600

4. Number of Special Advisers

Below are two tables:

— number of special advisers by department for as far back as available data allow;

— number of special advisers by Department.

Year	*Numbers*	*Total Paybill (£m)*
1995–96	38	1.5
1996–97	38	1.8
1997–98	70	2.6
1998–99	74	3.5
1999–2000	78	4.0
2000–01	79	4.4
2001–02	81	5.1
2002–03	73	5.4
2003–04	84	5.3
2004–05	77	5.5
2005–06	82	5.9
2006–07	68	5.9
2007–08	73	5.9

Examination of Witnesses

Witnesses: SIR GUS O'DONNELL KCB, Cabinet Secretary and Head of the Home Civil Service, and MR MICHAEL ELLAM, Prime Minister's Spokesman, examined.

Q467 ***Chairman:*** Good morning, Sir Gus and Mr Ellam, thank you very much for coming. You will notice immediately that we have a substitute Chairman. Unfortunately, Lord Fowler is ill, so I am standing in for him this morning, but thank you very much indeed for coming and for helping, from your important position, to contribute to this inquiry we are doing into the quality of government communications. Can I get it out of the way at the start by making a pretty quick complaint about the quality of communications from the Cabinet Office. We asked three months ago for background information on this and the information, which we got last week which was over a month late, three months after it was asked for, did not include the statistics we required and we just received those last night. Those are certainly more helpful than we feared they would be, but, as I know you would want to set an example in the area of your own responsibility, you will, I know, take it in the spirit in which it is offered, that it is not a very happy start for you, my having to make this complaint at the start. I hope you would feel able to endorse, from your position, the message to all government departments that, in dealing with select committees, promptness and sticking to deadlines that have been agreed by departments for the provision of information is not something to be treated as a passing event where it does not matter if the dates are missed because it does actually undermine very much the effectiveness of the work that we can do.

Sir Gus O'Donnell: First of all, I would just like to put on record my wishes for a speedy recovery of your Chairman.

Q468 ***Chairman:*** I hope that is no criticism of his substitute!

Sir Gus O'Donnell: Not at all, no. I am very pleased to say I have worked with both of you and very successfully, I hope. Secondly, yes, regrets about not getting as much information as you would want to you as quickly as possible and, you are absolutely right, it is very important that we do try our very best. I have been, it is fair to say, concentrating on the economy and the banking system for the last few months, but we do need to get these statistics to you. The information that we have provided just this week, when I looked at it, I tried to fill in where I can the parts there are, but I would stress that there is a very strong health warning that comes with the sorts of numbers we have provided to you, and we may get into that, in terms of interpretation of these numbers, but I think that will come up hopefully in answer to your questions.

Q469 ***Chairman:*** Well, thank you very much because that is the next question and I hope it is not just a question of false interpretation. It would appear in the last ten years, in terms of the number of press officers in government, that they have gone up from 216 to 373, and then the more loosely described "communications staff", staff working in the communications field, would appear to have gone up from 1,628 to 3,158, the first one being an increase of about 70% and the next one an increase of 100%. Would you like to comment on that? Would you say we got value for money on that? What is the justification for that?

Sir Gus O'Donnell: This does get to the heart where, I would say, you know how, when you get those financial ads, at the bottom it says, "Be very, very careful about what these numbers mean", and there are many aspects to that. It is certainly true, the numbers that were provided have gone from 216 to 373, and there are White Book numbers. I just warn you about the White Book. When I looked at the White Book, it was very interesting, it talked about the Government and agencies and then you have the CBI in there, and I am not sure the BBC would quite like to be put within the range of the Government and agencies, but they are in there in the White Book. The numbers have gone up, no question about that. In terms of why the numbers have gone up, well, the demands placed upon press offices have gone up. If you look at that number of 373, just to give you, I think, the most telling statistic to my mind, there are more than 373 journalists newly accredited to these two Houses, so merely in the House of Lords and the House of Commons there are more than 373 journalists accredited. There are 3,000 journalists in the BBC alone and that is just one institution. If you look at TV broadcasters in terms of the licences over the last 10 years the number of licences for TV broadcasters has gone up by a factor of 15; the number of local radio stations has gone up during the same period by 220%. I do not actually have any data on what the number of political blogs was 10 years ago but there are now over 1,600. These are happening in real time—that is just political blogs and there are far more things going on in the blogosphere; there are thousands of new blogs every single day. So the demands for us to actually service that—have they gone up, has the number of press officers gone up by a factor of 15? No. You could easily turn it round and say, therefore, why have they gone up so little rather than so much, so in terms of the demands they have increased dramatically more than the number of press officers. Secondly I would say that in terms of advertising spend, those numbers I have given you, if you look at volume terms which are in the table I have given you it is actually lower

than it was in real terms in 1986/87. These things vary quite a lot but it is in fact the Major period when it goes down quite a lot. In terms of definitions you mentioned the broader definition of communications, and I think this is the point I would like to stress, that actually when you think about what we are doing the press office side of it is in some ways the constant—dealing with ministers, and a lot of the things that Michael does, press and media. Actually it has grown beyond that quite considerably; when I think of communications now I think of a much broader series of issues we are trying to do. Your Chairman, Lord Fowler, did something very memorable when he did his AIDS awareness campaign—it was one of the really successful campaigns. That is communications. It is interesting who works on that and how many of those people would have been classified as communicators or not. Michael and I both questioned whether we would actually be classified in any of these numbers you have got as communicators—probably when I was head of the press office—because we both come from the civil service end, we were not members of government information, probably not in those figures. In general I would say that when it comes to what are the big issues we are dealing with now in terms of communications, for me it is that area of customer insight. When I think about public services and getting public services that actually deliver things for the customer—I remember going back to Citizens' Charter days when we were trying to get the public to feed back, all of these things require interchange and communication with the public. Precisely how you classify the people involved in that is a really interesting question; different departments do it in different ways. When we are trying to get communications going with the public we now use the new media a lot, we have a two-way interchange, we use the internet. I do not know how those people are classified in different departments, again there are no constant rules, and as policy-makers when I think of all the really important policy things such as climate change, obesity and those sorts of areas, what we are trying to do is influence people's behaviour and in those cases the line between policy and communications is completely blurred. Like I say, I would not have much faith in any distinction which takes communicators as a separate role; virtually every policy person in the civil service now has a role in terms of thinking about communications in its broadest sense, in the sense of getting customer feedback, working on that, working on how to do those two-way feedbacks and how to work on the big new area of behaviour change and all of the behavioural economics which is now the big new area which I know to be an interest of all parties in terms of getting into that area of how do we influence people's behaviour, for example in terms of their attitudes to recycling, their attitudes to smoking, alcohol and obesity. That is where the really big issues are in terms of communications.

Q470 ***Chairman:*** Just as an aside, are you the first person who has ever been both press secretary and permanent secretary of the department? I cannot think of anybody else and you have done it twice; it is just a curiosity of your situation which, it seems to me, makes your contribution particularly valuable here today.

Sir Gus O'Donnell: My colleague Sir John Gieve was press secretary to Nigel Lawson and went on to become permanent secretary at the Home Office.

Q471 ***Chairman:*** The other issue we have touched on a bit is to what extent does this increase in numbers reflect the fact that you are really running two entirely different systems? One is what I call the modern way of internet communication; to what extent do you recognise that you cannot leave behind all that quite significant section of the population who have no access to that at all, no understanding of it?

Sir Gus O'Donnell: I absolutely agree. We are dealing with a world that is becoming an increasing user of the internet. There are something like 30 million broadband connections but indeed it is true that when we think about communications we have to think about multiple channels. It is as true when we are trying to communicate what the Government is trying to do as it is when we think of the services we provide. The flagship I would point to is if you think about renewing your car tax, you can do it incredibly quickly on the phone or on-line, completely automated, whereas if you are not doing that you have to actually—as we all did in the past—collect together your insurance, your MOT certificate, your registration document, a cheque, go to the post office, queue up and finally get your disc. So we are improving customer service but we all the time need to be aware that it is a question of some people have access and are comfortable with broadband, which is why the Government is really pushing very hard on getting the whole population as far as possible to have access to broadband and on-line services and there are some very innovative ways of getting relatively older groups involved in that.

Q472 ***Baroness Howe of Idlicote:*** Forgive me, I just wanted to go back to the numbers because you slightly puzzled me. I totally accept the case for the need for more communication in today's world, but if everybody in the civil service is involved in this area where do you draw the line of those who are doing their job? You have produced some figures so where did you put the cut-off point?

Sir Gus O'Donnell: What I am saying to you, and why I wanted to provide the health warning, is that those lines are relatively arbitrary. As Cabinet Secretary I spend a lot of my time thinking about public service reform and the delivery of new ways of getting customer services to people and getting more feedback from people, so I am spending a proportion of my time on that—do you count me in or not in? The people in the Department of Health who are working on obesity, it is a cross-departmental public service agreement, so it is not just health, it is education, it is all sorts of people working on the anti-obesity strategies. A lot of those involve communicating, educating—are they in or not?

Q473 ***Baroness Howe of Idlicote:*** If I may interrupt, that did not happen before at all you are saying; nobody gave thought to how these areas were going to be communicated. There was the press around, there was the media around.
Sir Gus O'Donnell: In the past I would say the main areas of implementing policies were legislation, regulation and tax subsidies, so those sorts of incentive effects. There was relatively little on behaviour change. If you look back there is a bit in our memorandum about the first sorts of campaigns. There were some about savings in the First World War for example but it has become something that is much more important as people wish for the state to get more involved in these sorts of issues. The obesity one is a classic where if you ask people who is to blame for obesity, they say either their parents or the food and drink manufacturers, the individual comes quite a long way down this. If you ask them who should have the responsibility for putting it right 69%say it is the Government's job, so there has been a big shift in terms of expectations of the public that this is something that the Government will get involved in, whether that is right or not.

Q474 ***Chairman:*** We will give you a break and get Mr Ellam to sing for his lunch or whatever. You have taken over this new responsibility or role which was previously done, as I understand it, by two different people, one who was a civil servant and the latter who was a political appointment, David Hill. These roles have now been combined. How do you handle the political impartiality aspects of your job?
Mr Ellam: Just to be clear, as well as being the Prime Minister's spokesman I am the Director of Communications in Downing Street and that means I have responsibility for managing the civil service staff in Downing Street who deal with communications. Previously, as you say, the Director of Communications was a political appointee and he had power to instruct and direct civil servants. That power was removed when Mr Brown became Prime Minister, so the power of special advisers to direct civil servants was taken away. He decided that he wanted to appoint a civil servant as Director of Communications as well as being his principal spokesman on Government business, and that is the job that I perform. That said, of course the Prime Minister does need somebody to speak on his behalf on political matters that I cannot deal with, so I have working alongside me special advisers who deal with party political matters that relate to the Prime Minister in his capacity as head of the Labour Party or any other party political matters that relate to the Government that I cannot deal with. The way in which I am able to do my job while not getting involved in party political matters is that I have working alongside me somebody who is able to deal with the party political matters that I cannot deal with. They do not instruct me—I do not report to them, I report to the permanent secretary at Number 10 who is Jeremy Haywood and through him to the Cabinet Secretary.

Q475 ***Chairman:*** Is he on the Cabinet Office books or is he on the Number 10 books or is he paid for by the Labour Party?
Mr Ellam: These are Number 10 special advisers who deal with political questions relating to the media, as has been the case for some time—there are lots of precedents for that—and they deal with party political matters that I cannot deal with.

Q476 ***Chairman:*** I thought David Hill was paid by the Labour Party?
Mr Ellam: No, he was paid for by the Government.

Q477 ***Chairman:*** I was misinformed on that. You are ultimately accountable to the permanent secretary of Number 10.
Mr Ellam: The permanent secretary at Number 10, who is the senior civil servant in Number 10, Jeremy Haywood. He is my boss and through Jeremy I am accountable and report to the Cabinet Secretary.

Q478 ***Chairman:*** So we have a permanent secretary at Number 10, a permanent secretary in the Cabinet Office and a Cabinet Secretary, is that right?
Sir Gus O'Donnell: No, I am the permanent secretary of the Cabinet Office. Remember, people distinguish between the Cabinet Office and Number 10 and it is worth remembering that Number 10 is a part of the Cabinet Office. When Michael gets his payslip it says it comes from the Cabinet Office, not Number 10. Jeremy is, as I say, a permanent secretary within Number 10 who reports to me. There are others, Jon Cunliffe for example who works on the international side, and they report to me. What Michael has been describing is very much a return to the way it was in my day when I was press spokesman. I would report to the Cabinet Secretary and I had charge of all of the

civil servants on the communications side when I was press secretary to the Prime Minister.

Q479 ***Chairman:*** How does that staff compare with your time?
Sir Gus O'Donnell: It is very similar in terms of the press office operation; what is new and additional is all of the communications side—for example, we did not have a Number 10 web presence in my day, none of those sorts of things were there.
Mr Ellam: As Gus was saying, one of the big areas where we have expanded in recent years has been what we call digital communications, so how we communicate with the public through the internet. That is not just one-way, that is two-way, so we have recently introduced a facility whereby the public can ask questions via a webcast direct to the Prime Minister—it is an on-line version of Prime Minister's Questions if you like.

Q480 ***Chairman:*** Who is answering them?
Mr Ellam: The Prime Minister.

Q481 ***Chairman:*** You are not seriously telling me he is answering every question that comes on his web?
Mr Ellam: What would happen is that we would ask for questions to come in via a YouTube format, so in a webcast format, by a particular date.

Q482 ***Chairman:*** On a particular subject do you mean?
Mr Ellam: They could be on a range of subjects. He would then answer a selection of those questions on a regular basis. This is something we started a couple of months ago.

Q483 ***Chairman:*** On film.
Mr Ellam: On film. That is just an example of the way we are communicating at Number 10.

Q484 ***Chairman:*** So you are having to get together—it is a completely new system—with people who are having to put it out to departments, what is the answer to this question, and then feed it back and the Prime Minister can read it out on a film.
Mr Ellam: Correct, and also to ensure that we have the technology and systems in place to enable us to broadcast the Prime Minister's response and the questions on the Number 10 website.

Q485 ***Chairman:*** Do you think that is worth doing? It obviously adds to his burden and adds to the cost.
Mr Ellam: If anything improves the direct communication between the Prime Minister, Ministers and the public it has to be a good thing. For example, we have hosted on the Number 10 website in the last two years about 30 web chats direct between Ministers and the public, again as a way of enhancing two-way communication via the internet direct between the public and Ministers.

Q486 ***Chairman:*** Do you have audience research figures on that?
Mr Ellam: I am sure we can get you the audience research figures on that.

Q487 ***Chairman:*** It would be quite interesting to see them.
Sir Gus O'Donnell: This is a general point that I am sure your Committee would be interested in, as to how you counter this. We have seen declining participation rates in elections and the like and it is one of those areas where it would be good for society as a whole if we could increase engagement in the political process, particularly amongst the young, and the form of communication that the young like to use is very much this form of communication. In terms of the burden on the Prime Minister, the Prime Minister is answering Prime Minister's Questions every week in which he needs to be briefed up for virtually everything, so I do not think it is a great burden in that sense, an extra burden that is imposed, it is just a question of the public being able to put their questions directly to the Prime Minister.

Q488 ***Lord Corbett of Castle Vale:*** Can you just make clear, who does the selection of the questions which are put to the Prime Minister? Mr Ellam cannot touch the political ones, should there be any, so is it the special advisers who do the political ones and, Mr Ellam, you do the non-political ones?
Mr Ellam: I am sure we can get you a note on the exact process but there is some external independent input into the selection of the questions. We are trying as much as possible to select a cross-section of the questions that we get in.
Chairman: Thank you; we will move on.

Q489 ***Baroness McIntosh of Hudnall:*** Can we move on to the question of how the relationship between Parliament, the Government and indeed the media is managed? We have heard evidence from directors of communication in various government departments and also from journalists about various aspects of briefing in advance of off-the-record attribution of information and so forth. Can you first of all tell us how common it is to brief in advance about ministerial statements, whether that be on or off-the-record, and if the content of a statement has been briefed in advance how do you see that affecting the accountability between government departments?
Sir Gus O'Donnell: I am very clear that Ministers should announce new policy announcements first of all to Parliament; that is very clear, that is the way it should be. Of course we live in an age where the media wants to look forward, they are not interested

in reporting what has been said, they want to report what is about to be said, so they are looking to write a report on something that is to come. It is not difficult if they know, as we will have put down on the Parliamentary paper that there is going to be a statement on X the next day, and it is very rare nowadays that it is not quite predictable in the sense of there has generally been some consultation, there has generally been some open discussion. We live in a much more open period where policies are debated at great length before Ministers come to final decisions, so we are in that world where, whilst I emphasise it is really important that Ministers go first to Parliament to make those decisions there, the media want to jump the gun as it were and be always one step ahead of the game. That is a challenge for all of us.

Q490 ***Baroness McIntosh of Hudnall:*** It is not just that the media want to be one step ahead of the game. We certainly have formed the impression from what has been said to us that Government would like to be one step ahead of the game on occasion as well and that the practice of briefing is not simply in order, as it were, to feed the media desire for information, it is to secure an advantage for the Government or a particular department. Since that seems to be the case what is the purpose of preserving this mantra of accountability to Parliament when it is clear that it does not really amount to more than a formality?
Sir Gus O'Donnell: I do not think that is true in the sense that at the end of the day ministers come to the House, they make their statements in both Houses and they are there to be questioned by Members of both Houses who can ask them any questions they want, including why is it we have heard about this in the media first? In that sense there is direct accountability and it is really important that that accountability exists and it is for MPs to ask whatever questions they like of a Minister appearing at the House, and indeed they have the opportunity to do that. That sense of accountability is very important and we need to keep that.

Q491 ***Baroness McIntosh of Hudnall:*** How can we square that with the question of off-the-record or unattributed briefing that has been a very constant theme through a lot of the evidence that we have heard, and the question of how information is managed—I am not going to use the word "spin" because it is over-used and redundant, but managing information so that it arrives in the right place at the right time and in the right form is a very sophisticated process.
Sir Gus O'Donnell: It is a very sophisticated process and it is a very important process in many ways—for example in the area of market-sensitive information it is actually crucial that information is provided in the right way at the right time and in accordance with the law. I am a strong believer in all of that, therefore, but on the other hand I noted the evidence that you had from people like Nick Robinson, Adam Boulton and Tom Bradby about briefings. Off-the-record briefings with journalists have been going on since time immemorial; this is not new, this is something that Ministers have been doing for a long while, that politicians both in government and out of government do a lot of the time.

Q492 ***Baroness McIntosh of Hudnall:*** I do not think anybody is under any illusion that it is new or even that it is significantly more in evidence now than it was, but what certainly I am struggling to understand is the relationship between the formal processes in which, for the purposes of the argument, we might include lobby briefings as a formal way of communicating and the informal ways in terms of how we interpret and understand the information that government wants us to get.
Sir Gus O'Donnell: What we are trying to do is actually give as many formal open possibilities as we can and indeed the balance, if anything, has shifted towards the formal open part. If you look back on it, when I was press secretary I was doing two lobbies a day; they were not on the record, they were in some sort of grey area and I became the first person to be happy to be quoted as Prime Minister's spokesman. The Prime Minister certainly did not do monthly press conferences; the Prime Minister did not appear before the Liaison Committee. The degree of openness has increased quite a lot and Michael might want to pass on what actually happens now—he probably knows more than I do.

Q493 ***Baroness McIntosh of Hudnall:*** Before he does that can I just add in one specific example which you will no doubt be aware we wanted to ask about which is the Prime Minister's visit to Basra last autumn, which was no doubt an important visit and had important announcements attaching to it, but the timing of it gave rise to a considerable amount of comment, shall we say, if not anger, and it did directly cut against the determination that that sort of information should be provided first to Parliament. Taking that as an example, can you explain how that works?
Sir Gus O'Donnell: Michael was there so it is probably best to get him to start.
Mr Ellam: The Prime Minister himself has answered questions on this particular issue. What he said when he was in Baghdad was that previously troop levels had been at around 5,500 and as soon as we moved to provisional Iraqi control of Basra province we would expect troop numbers to fall to around 4,500. That was something that was due to happen imminently at that time; in fact the Prime Minister of Iraq,

following a meeting with the Prime Minister, went out that day and gave a press conference saying that we anticipate provisional Iraqi control of Basra by the end of October, which was in just a few weeks time. If you look at what the Prime Minister then actually said in his statement to the House, it was a much, much more significant statement and a much more significant set of announcements, of which this was only a relatively small part talking about what was likely to happen in the very short term. What the Prime Minister said in the House was that he would expect troop numbers actually to fall to 4,000 within a few months and then fall to around 2,500 by the following spring. It was in that statement that he was setting out the Government's medium term strategy with regard to Iraq. The issue of what might happen over the next couple of weeks when we moved to provisional Iraqi control was a fairly small element.

Q494 ***Baroness Bonham Carter of Yarnbury:*** Going back to off-the-record briefing, you are Director of Communications, Mr Ellam, does this off-the-record briefing not get in the way of your ability to communicate in the way that you wish to communicate?

Mr Ellam: As Sir Gus was saying, this has been a feature of Westminster life for many years—it is not unheard of or particularly new for Ministers or others to have conversations with journalists; that happens all the time. What I would say though, just to reinforce what Sir Gus said, is that you can certainly make a credible argument that the balance of on-the-record to off-the-record briefing has shifted towards more on-the-record briefings and statements in recent years. For example, because of 24-hour news channels now quite often if there is a big story running Ministers are giving three interviews a day on the same subject because the story will move during the course of the day, and that certainly would not have been the case 10 years ago let alone 20 years ago. Lobby briefings are now fully on the record with transcripts on the Number 10 website. The Prime Minister gives monthly press conferences; in addition, in the last year he has given 18 press conferences with foreign leaders, and he has given 16 press conferences while overseas, so he has given about 46 press conferences—almost one a week—over the last year. There is plenty of opportunity, therefore, to ask the Prime Minister direct on the record about the issues of the day. He appears before the Liaison Committee twice a year; we have web chats, for example, 30 in the last two years, to ask the PM what he was talking about, and FOI. We have not looked at this in a scientific way but we could certainly mount quite a credible argument that the balance of on to off-the-record briefing has shifted, if anything, towards more on-the-record briefing and statements in recent years.

Q495 ***Baroness Bonham Carter of Yarnbury:*** In a sense it is not so much about the balance, it is about the effect. With the huge story of recent weeks there was certainly a feeling that Mr Robert Peston was getting information for others, and indeed one of the witnesses who appeared before us, Jackie Ashley, actually referred to him seeming to be the Government's spokesman of the moment. That cannot really be the right way to communicate.

Mr Ellam: As Sir Gus was saying, in a world where the Government is speaking regularly to people outside of government about what we intend to do and we are consulting with people, it is inevitable that information is going to get out and therefore, of course, that is going to affect how stories are reported. In relation specifically to the Robert Peston story that you refer to—I know this did come up in one of your previous evidence sessions—the story that was being referred to was a story that he reported on 7 October about a meeting between the Chancellor and the banks, and if you look for example at Robert Peston's blog he says explicitly this has come from the bankers. He says according to bankers these three were disappointed at a private meeting last night with Alistair Darling that he did not present them with a fully elaborated banking rescue plan. One banker told me that what he called the "Gang of Three" of Barclays, RBS and Lloyds told Darling to "pull his finger out", so I do not think we would accept in a sense the premise that for example in this case this story had come from the Government, because Robert Peston himself is saying explicitly that he is sourcing it from the bankers. Of course, in a world where the Government is out there speaking to people and those people are then communicating to the press, it is inevitable that some of this is going to get out into the public domain. You could conclude from that that the Government therefore should not speak to anybody before it makes any announcements, but we do not think that would be a particularly sensible way of conducting policy.

Baroness Bonham Carter of Yarnbury: The fact is that other journalists believe that he has some special link.

Lord Corbett of Castle Vale: Perhaps he is just a very good journalist.

Q496 ***Chairman:*** This is a slippery slope because you have rightly referred to the fact that ministers from time immemorial have spoken to journalists and cannot refuse to talk to them. There is some inspired guessing and sometimes in the interests of getting clear public information out there is a need for often not very well-informed journalists to be taken through the detail of a policy, sometimes in advance of Parliament, under a strict embargo so that when they actually do write about it, they get it right. In the present financial situation it is quite important that

statements that come out are right, I understand that. There is then a further slippery slope when advance briefing might appear more like a leak. Can I ask you, Sir Gus, how many leak inquiries have you conducted and have any of them actually produced any successful outcome?

Sir Gus O'Donnell: We certainly have a number of leak inquiries. It is rare that you will be able to, in a leak inquiry, actually finally pinpoint something to one individual because, for example, journalists will not disclose their sources so it is hard for us to get an answer to those. I do not have a figure for you for how many we have actually been able to take to a conclusion, but when we have found things we have certainly taken them forward as far as we can. There was a recent case where, in the end, it became an Official Secrets Act issue, where there had been a leak and those people—two individuals I think—were taken to court and there were successful prosecutions.

Q497 ***Baroness Howe of Idlicote:*** May I go back a bit to Phillis and ask Mr Ellam one or two questions there because of course the main thing in that report was the comment that "The lobby system was no longer working effectively for either the government or indeed the media" and that all media briefings should be on the record. You are the leading light in the lobby briefings; are you actually yourself held publicly accountable for what you say?

Mr Ellam: I am publicly accountable in the sense that what I say is on the record and therefore is immediately reported; therefore, if I say something that is incorrect or untrue then that becomes apparent very quickly. In that sense I am accountable because it is open—obviously I am also accountable to the Cabinet Secretary and ultimately Cabinet Ministers for ensuring that what I say is an accurate reflection of government policy at the time.

Q498 ***Baroness Howe of Idlicote:*** Returning to the two daily lobby briefings that go on, are they regarded as really putting a lot of pressure on Number 10 so that there is a feeling that you have to keep on making announcements to keep them having something to say? Does that come into it and really are two briefings necessary?

Mr Ellam: I do not think they put pressure on Number 10 to have something new to say, because the purpose of lobby briefings is not really to generate news stories—it is quite unusual, it might happen once a week or maybe once a fortnight, that something I say at lobby briefings becomes a news story in its own right. It is much more often the case that it becomes a line, a paragraph or two, in a broader news story, or it might move the story on a bit during the course of the day for the wires and for the 24-hour news channels, but by the time the papers get to the end of the day and summarise the day's events and look ahead to the next day, it is often that what I said at lobby does not necessarily feature at all or if it does it might just be a few lines. In that sense I do not think it does put any pressure on us to keep coming up with new announcements because we would not use lobby briefings necessarily to generate news or make an announcement. In terms of two lobbies a day, it probably does work, that probably is about right. There are always arguments for change that you can make—you clearly need a morning lobby briefing in order to mop up what is in the papers that morning and what has been running on the morning news programmes ahead of the lunchtime news, and quite often different things will happen during the course of the afternoon which require further comment from us during the course of the afternoon. Certainly before I started this job I consulted quite widely with members of the lobby and the general consensus was that it was probably best to stick to the arrangements as they then were.

Sir Gus O'Donnell: This is a longstanding arrangement and I would stress that when I was press secretary in 1990 it was two a day; it is exactly the same.

Q499 ***Baroness Howe of Idlicote:*** If I might take it a little further and refer to the comment you made, the number of journalists accredited to attend these briefings are equivalent to the number of those who are working on the subject inside government as it were. With that in mind and very much bearing in mind complaints we have had from regional representatives who regard themselves very much as second-class citizens in terms of briefing and not being brought up to date, would it not in fact be sensible to open to them as well the chance to attend these lobby briefings?

Mr Ellam: For the benefit of the Committee maybe I could just explain how the briefings are structured. There are nine briefings a week, two a day and one on Friday. Number 10 hosts three of those, which are Monday morning, Tuesday morning and Thursday morning, and the lobby host the rest. In terms of the briefings that we host any journalist can come to that, it does not make any difference to us who comes, so anybody can come. In terms of the briefings that the lobby hosts, my understanding is that the vast majority of regional newspapers are members of the lobby anyway so they also should be able to come.

Q500 ***Baroness Howe of Idlicote:*** You are saying that any of them could come, they could be accredited and come to any of those briefings.

Mr Ellam: Any journalist could come to the three lobby briefings a week that we host: we impose no restrictions on who can come. In terms of who can come to the briefings that take place here in the

Houses of Parliament, hosted by the lobby, they need to have a lobby pass. My understanding is that the vast majority of regional newspapers will have journalists in the lobby so they can come to the lobby briefings if they wish.

Q501 ***Baroness Howe of Idlicote:*** Thank you for that. I have one last point in this whole area: Phillis also recommended that "Ministers should deliver announcements and briefings relevant to their department at the daily lobby briefings" yet there has not been any increase in the numbers of those sorts of briefings. Can you give an explanation for that?
Mr Ellam: Of course if Ministers want to hold press conferences they can hold press conferences and if they want to hold their own press conferences they can invite whatever journalists they like to a press conference, including specialist journalists, so if the Treasury has an announcement to make they will want to invite economics correspondents as well as political correspondents, so it probably makes more sense for the departments themselves to organise their own press conferences. The second point is that one thing that is not entirely clear from the Phillis review is how would a Minister's attending a lobby briefing on the day they were making a big announcement relate to their relationship with Parliament? They could not attend the morning lobby briefing and brief the lobby because that would be before the announcement had been made to Parliament and if they attend the afternoon lobby briefing the announcement has already been made and they already will have taken up to an hour's worth of questions in Parliament anyway, so in a sense it is not clear what value would be added by having an additional lobby briefing after they had already made the announcement to Parliament and taken all the questions. If they want to have a press conference, they can do that anyway.

Q502 ***Baroness Howe of Idlicote:*** It is interesting that the numbers have not gone up; is there a need to encourage them to do it at a time more convenient to themselves?
Mr Ellam: As I say, if Ministers want to hold press conferences they can do that, they can invite just the lobby, they can invite specialist correspondents, they can invite whoever they like. If they are out giving interviews on news channels there are lots of ways in which Ministers are communicating with the media.
Sir Gus O'Donnell: I should stress that the numbers of press conferences Ministers are having have almost certainly gone up and not down. It is that the number of Ministers doing it via the lobby has gone down a lot, I think for the very sensible reasons that Michael has said. I actually think it is much better for Ministers to be delivering those statements to Parliament and then doing those statements and press conferences—for example, if it is on the criminal justice system—when the crime correspondents are there. The crime correspondents will not always be accredited to the lobby and therefore you need to do it not within the lobby, so it is a recommendation that was not quite right.
Chairman: That is a very good point, pretty well made there. Lady Eccles.

Q503 ***Baroness Eccles of Moulton:*** Could we please turn now to civil service impartiality which obviously will involve discussing the relationship between press officers and special advisers. Phillis said that the role for press officers is to talk about achievements and facts and declare policy but not to be involved in political advocacy—this will be absolutely crystal clear to you. A question that arises is how easy or difficult is it for a civil service press officer to remain impartial when one of their key roles is to promote government policy? When we have dealt with that, I would just like to move on to the current procedure for settling the inevitable disputes which must occasionally arise between civil servants and special advisers.
Sir Gus O'Donnell: On the question of impartiality, absolutely, civil servants have to be impartial. There are four key values that are in the civil service proposals that a joint committee of both Houses is currently considering: honesty, objectivity, integrity and impartiality. Impartiality is absolutely crucial: civil servants must have that. You have before you two people who have attempted to manage that line of being there and doing what government civil servants must do and, quoting from the civil service code, our job is to "support the government of the day in developing and implementing its policies", so it is for us to explain and part of that is very important. You will have to decide how well we do that, all I can say is that the evidence you had from the likes of Nick Robinson and Adam Boulton made references to the way Mr Ellam has managed that process and I wish I had had credits as positive as that in terms of the way I was managing the impartiality, but I think it is hugely important and it does require civil servants to understand those distinctions. It is enormously to Michael's credit that we have got to a situation that I very much wanted to achieve when I was press secretary, of understanding that we deal with the civil service side and that sometimes we will disappoint journalists who will want us to cover more than that. If we get journalists saying they would like to have got more from us because they are trying to push us into that party political domain which we will not go into, then that is a frustration that I think it is right for us to create if you like.
Chairman: Many of the comments were worryingly complimentary; I was trying to work out what Mr Ellam does.

Q504 ***Baroness Eccles of Moulton:*** The journalists then have the special advisers to fill that gap, presumably, so why are they so concerned when civil servants are not prepared to stray across the boundary?
Sir Gus O'Donnell: It is just simpler for them to have one person who can answer all the questions, that is all.

Q505 ***Baroness Eccles of Moulton:*** I see; easy life.
Sir Gus O'Donnell: An easy life.

Q506 ***Chairman:*** Do you want to deal with the issue of special advisers while we are talking about them? The thing that I recall about special advisers is that they used to be special advisers, a number of them, when they first came in, and then a bit more recently—it started I think with the Conservative Government—some of them became really PR officers for their Ministers. Would you like to comment on that trend?
Sir Gus O'Donnell: There has been, as I say, an enormous growth in the media, and there has been an enormous growth in the demands on Ministers to make statements, state their wishes—you know, the 24/7 media and the vast increase in the number of journalists. It has certainly been the case that special advisers have been asked for their views because a number of these issues that come up are of a party political nature which we, quite rightly, as civil servants will not get into. There are issues going on at the moment.

Q507 ***Chairman:*** Some of the special advisers, professors and other people were extremely knowledgeable in their subjects and were brought in by Ministers to bring an outside view to certain policy issues within their department. Then you moved on to the special adviser who was the guide to the civil servants on how Ministers might react to things from their party political background, but then there is another development it seems to me where these people have become individual, personal PR men for the Ministers themselves. Would you like to comment on that development?
Sir Gus O'Donnell: It is very interesting that there is that second tier. Yes, you have got the specialist special advisers if you like, and in my Treasury days I remember under all sorts of administrations people coming in with a strong economics background; then there were some other people who came in who were very political and indeed in many examples have gone on to be MPs. What has happened there is that set of people who are very political and want to go into the MP line, as the media have changed they have become more involved in the media side of things and that is an inevitable consequence—there is something in the Tony Blair speech about this, backbench MPs learning to give a press release before they learn about a Parliamentary statement nowadays, that actually modern politics is pushing people more to be in the stage of you have to be involved with the media much more. That is the trend that is happening.

Q508 ***Chairman:*** You are talking about being involved in it, I am talking about the sort of chap who you find briefing against some other Minister and saying my chap is doing a splendid job and he should move into the Cabinet or should get promoted, all that sort of stuff. Do you regard that as part of the special adviser's job?
Sir Gus O'Donnell: Absolutely not, and there is a special advisers code that would be very clear that that is not what they should be doing, briefing against other Ministers.

Q509 ***Chairman:*** Or promoting an individual.
Sir Gus O'Donnell: They are promoting government policies and if you are promoting, for example, the work that the Chancellor has just been doing on the banking policy and explaining how that has been leading the world, it is difficult in that not to be promoting the person that is fronting it up, i.e. the Chancellor. It is quite hard to disentangle those two things.

Q510 ***Chairman:*** He should not exaggerate the latter.
Sir Gus O'Donnell: He or she should be very clear about promoting the policies of the Government.

Q511 ***Baroness Eccles of Moulton:*** I just wanted to know whether there were ever disputes actually between civil servants and special advisers that have to be resolved, with some of them getting up to the highest level or whether this is something that does not exist any more.
Sir Gus O'Donnell: When you asked Howell that question he said during his four years he had not had any that had come up to that level. It is certainly clear again in the code for the civil service and in the code for special advisers precisely what they should do and should not do, and we are very clear about making those cases. Certainly, no, I have not had to deal with any cases of that kind—it is very important that we get the message through to Ministers because that is the responsibility line for special advisers and for civil servants to make available the possibility that if something is happening that they know they can put their hands up. In general the fact that we have not had those and the fact that we have strengthened the code which allows civil servants not just to go to line managers or permanent secretaries, they can actually now go to civil service commissioners, is a good sign.

Q512 ***Baroness Eccles of Moulton:*** There might be a few ructions within departments but they would not be serious enough to receive much attention.
Sir Gus O'Donnell: I have certainly not been made aware of any.
Chairman: Can we just have that question on regional media? Lord Corbett.

Q513 ***Lord Corbett of Castle Vale:*** Sir Gus, if you have not done so can I recommend that you read through the evidence we took from representatives of the regional press? Many of the comments were complimentary, two of them were not. They complained about being treated like second class citizens and having worked in both the regional press and dailies I understand that comment, but nonetheless it was said with some force and there were some good examples given about that. Phillis, by the way, you will recall, recommended a greater emphasis on regional communications and there was a review carried out by the Regional Co-ordination Unit of the Government Office Network; can you just say whether you are aware of these complaints? I put to one of the representatives, on the back of the complaints they were making that the Government never do this, that or the other, have you ever gone to them and asked why: have you put the proposition to them? He said no.
Sir Gus O'Donnell: To be honest this is familiar territory. When I became press secretary in 1990 I had requests to get briefings for the Prime Minister with regional editors, which we did, and I went out and visited different parts of the regions and talked to them. If anything people would say the Government—and this has been true throughout the last 20 years—would like to engage more with the regional media because they feel it is a more direct line of communication. We are certainly trying to establish that by getting the Government out of Westminster so much and we did have the first Cabinet outside London, we had it in Birmingham.

Q514 ***Lord Corbett of Castle Vale:*** Well picked.
Sir Gus O'Donnell: We will go outside London again, but it will not be Birmingham again I am afraid.

Q515 ***Lord Corbett of Castle Vale:*** You would be made very welcome.
Sir Gus O'Donnell: It will be somewhere else. This Government has appointed regional Ministers, and there is now a regional council, so there is a strong feeling that there does need to be greater engagement. Your question about the review, there has been work from the Government Office Network to renegotiate the service level agreements with COI in terms of how they interact with the regional media, and the COI has taken over some of these regional roles. I spend a lot of time in my head of civil service role going around the regions and I always look in at the Government Office Network and try and get involved in the regional media, in the sense of asking them how they are doing it with Ministers. I think it is a hugely important thing and I know the Prime Minister does as well. Do you want to add anything?
Mr Ellam: Whenever the Prime Minister goes on a regional visit he always makes a point of ensuring that he factors in time to speak to the regional media for the area that he is visiting, so it is something that he attaches personal importance to. As Sir Gus is saying, there is more that we could do and there is more that we would like to do in this area; certainly within Number 10 we would encourage departments always to think about the regional dimension of any particular announcement or news story that they have.

Q516 ***Baroness Bonham Carter of Yarnbury:*** One of the things that they mentioned was the concept of regional and local in that there is not a very good understanding of what a region is. I do not know if you have anything to say about that.
Mr Ellam: Not particularly.

Q517 ***Lord Corbett of Castle Vale:*** Forgive me it was the eastern region which is a very ugly beast. If you start in Hertfordshire and Essex and go into the depths of the wildernesses of Lincolnshire, Suffolk and Norfolk, they were feeling very much out on a limb there. It is not just distance, I think there is a state of mind there.
Sir Gus O'Donnell: I have been to visit them out there. There is a very active government office in the east of England so we will do our very best, we will redouble our efforts.

Q518 ***Chairman:*** Taking it even further down the line, our previous witnesses today were from Citizens Advice, which is a very good sounding board for how well your overall information systems work. The verdict was pretty mixed. They are of course the people who get all the people who cannot understand or find it difficult and Lady Howe drew attention to some of the very poor results coming out of some of the benefit side. We talked a bit about tax credits but we also talked about other benefits for which there is a very low take-up. Do you consult at all with people like Citizens Advice? They seemed to me to be an excellent sounding board for how well basic information for the citizen is actually conveyed and how well it is understood.
Sir Gus O'Donnell: This is a hugely important topic and I am very pleased that you are talking to people about it. The Government's job is to deliver for the citizens and it is really important that we get that feedback. We are trying to get it in all sorts of ways and certainly the Office of the Third Sector, which is

based within the Cabinet Office, is a relatively new creation working on these various groups to get their feedback as to how we can work with them. Sometimes it is about using the third sector groups to actually deliver the services directly, and there are lots of examples of that, other times it is about allowing them to give us feedback on what is working and what is not and the channels through which it is working. If you talk to the Citizens Advice Bureau they will say there is an enormous amount of information out there, we can now put a lot more on the internet, we have improved contact services, and it is a lot easier now than it was before. Certainly, part of that means that we try to do rather more complicated policies to actually get at specific groups, so we are trying to learn and get this feedback; it is a really important part of improving services to customers and a lot of the developments that there have been have been along those lines. If you wanted us to do more, this would involve us spending more, having more people involved in communications, not less.

Q519 ***Baroness Howe of Idlicote:*** If I might just follow up on that, they had a lot of good things to say about improvements but just taking some of your successful campaigns that you have referred to in this document, what they were drawing attention to is those who could well and truly have done with the money that has not been claimed. Something like only 20% of people who are entitled to housing benefit have actually got it and there they do feel that a rather closer analysis and working together with organisations like them and analysing why that particular campaign has not worked could produce better results.

Sir Gus O'Donnell: I am completely with you, and that is a session we had. I get together the top 200 civil servants now every six months and we had a session on precisely that issue about customer insight and understanding as we go through things that we are getting through to the relatively easy to reach groups. The example we were working on was smoking where you have managed to get to a large number of groups, you have managed to reduce smoking prevalence but you have actually got that really hardcore group left. You need quite a lot of insight into why is it that they are not deterred, for example by higher taxes or the advertising is not right. We have had a lot of feedback which has allowed us to change the nature of the advertising campaigns to get at the remaining group and I think that is at the heart of it, it is knowing who are the really hard to reach groups. Unfortunately, they are by definition hard to reach and you are going to have lower success rates as you get into that really difficult group.

Q520 ***Chairman:*** You have done us the courtesy of looking at some of the previous evidence that we had to this Committee and you may like, when it comes out, to just flick through the CAB evidence as well.
Sir Gus O'Donnell: Indeed—that was this morning.

Q521 ***Chairman:*** That was this morning. You are obviously very familiar with many of the arguments but it might be interesting just to flick through it. We have covered everything; Sir Gus and Mr Ellam, thank you very much indeed for coming and for answering our questions. If by the time we have had a chance to digest the further information you have just given us there are other points that emerge, maybe Lord Fowler, revived and restored, will write to you. Thank you very much indeed.
Sir Gus O'Donnell: Thank you very much.

Supplementary letter from the Cabinet Office

Thank you for your letter of 19 November in which you request information about the number of letters, emails and telephone calls received from the public in each year since 1998.

We have a complete record of written correspondence received since 2000:

2000	449,322
2001	409,920
2002	668,445
2003	445,855
2004	248,813
2005	1,818,410
2006	228,892
2007	509,652
2008 up to 25/11/08	425,387

The Prime Ministers office is currently redesigning its email system with a view to providing a more effective service, however, through the previous system we were receiving on average 5–7 thousand emails a week.

Unfortunately telephone calls from members of the public are not separately recorded.

As you may be aware, we have recently re-launched the 10 Downing Street website, and have integrated into it a range of communications measures, including more video content. You Tube videos, the Flickr and Twitter messaging service.

During the period April to September this year, there had been 18,197,000 page views of the website, approximately 800,000 film views on YouTube, 212,000 views of 600 photos placed on Flickr and we have over 4,700 followers on Twitter.

There have also been over 6,000 e-petitions processed containing 9,107,835 confirmed signatories.

I hope this information is useful.

WEDNESDAY 5 NOVEMBER 2008

Present	Corbett of Castle Vale, L	Manchester, Bp
	Eccles of Moulton, B	Maxton, L
	Fowler, L (Chairman)	McIntosh of Hudnall, B
	Howe of Idlicote, B	Scott of Needham Market, B

Examination of Witnesses

Witnesses: Rt Hon Liam Byrne, a Member of the House of Commons, Minister for the Cabinet Office and Chancellor of the Duchy of Lancaster, and Mr Alan Bishop, Chief Executive, Central Office of Information (COI), examined.

Q522 ***Chairman:*** Welcome and thank you very much. I think, Minister, you want to make an initial statement.

Mr Byrne: With permission, Chairman, that is very kind. I am with Alan Bishop, who is Chief Executive of COI, in case your questions take me on to territory with which I am less familiar, but I did just want to say by way of introduction that I am very grateful to the Committee for focusing on this. As a new Minister at the Cabinet Office beginning to find my way around, it is enormously useful to have the Committee focusing on this at this time and I am very much looking forward to the recommendations, and I hope that you will see in my comments a sort of openness to what the Committee has to say this morning. I think I would just start really by sharing three initial observations which have struck me over the last month, my first month. The first is that it does appear that there has been a good degree of progress since Phillis and I look forward to the Committee's observations on that point. I think a number of your witnesses, Chairman, have talked about a very different atmosphere in government communications now, and I thought it was interesting that both the Cabinet Secretary and the former Permanent Secretary of COI observed that no real problems had crossed their desks. There have obviously been a number of other changes too. I think the changes that Howell James initiated around professionalising the government communication service were important, and obviously there has been a complete change in the way the government communicators use digital media, not just the Number 10 website, but Directgov itself now, I think, gets something like 10 million visitors a month, which is, I think, extraordinary progress. The second observation though is that it does strike me that there is still some unfinished business from Phillis and what Phillis highlighted in particular, the role of regional media, and I think that this is a terrifically important area where I am not completely convinced that the Government has made the progress that it might have, so one of the steps I have taken is to commission an audit of government communications activity in the regions just to see whether actually we are doing everything that we can to implement the agenda that Phillis, I think correctly, pointed out was pretty important now. Then, my final reflection really is that it is quite clear that the world that is coming is going to pose some substantial new challenges for government communicators. Gus, I know, underlined this point about the way in which government communicators can help, and should be thinking about how they help, to change behaviour. Now, that obviously is important for the future of public policy in a whole range of policy areas. Prevention is always cheaper than cure and, if there are behavioural changes that government communicators can help address, then I think that will be all to the good, not least because I think it will save taxpayers' money. The second thing that is obviously going to unfold in the future with greater pace and velocity is the proliferation of media channels, and again this is a big opportunity because it allows government communicators to begin addressing an audience of one, as it were, but we have obviously got to guard against the advent of new inequalities. We have obviously got to seize the new possibilities which are available, but actually all kinds of change like that create new risks of new inequalities, and that is why the Committee's focus on questions about the digital divide, which is amongst your questions, I think, is terrifically important, so, Chairman, for me, this is a very welcome opportunity to talk with you, but it is even more important for me to listen to what you have got to say when your Report is tabled in the not too distant future, I hope.

Q523 ***Chairman:*** Thank you very much indeed for that, and we will come to one or two of those points as we go through. I suppose politically we are in the morning after the night before, are we not, and I am tempted to ask you when you went to bed!

Mr Byrne: Five to 12.

Chairman: That is very good, very modest.

Lord Maxton: With the radio on, I bet!

Q524 ***Chairman:*** Just having started on this political theme, can I just stay on it for a moment. We now have all the excitement on the other side of the

Atlantic, but I guess we are now in the pre-election period here; the election must take place in the next, roughly, 18 months. The Government have a very substantial army of press officers. How do you ensure that they are not party-political?
Mr Byrne: Well, I think the Prime Minister started off on the right foot with regards to this question. It was obviously very significant that one of Gordon Brown's first acts as Prime Minister was to withdraw executive powers from Number 10 special advisers so that we restored the position of civil service communicators and reporting to civil servants. I think that was significant and I think it did set a tone. Obviously, what that now means is that civil service communicators, if they were in any doubt, have now had that doubt lifted and they are governed in their behaviour by the Civil Service Code, and that, I think, is pretty clear about the kind of behaviour that is expected of civil servants in their relationships with the media. I think possibly most important of all is the emphasis that the new Code, which I think was updated in 2006, now puts on a number of core values around integrity, honesty, objectivity and impartiality. My eye was drawn to one particular sentence in the 2006 edition of the Civil Service Code which says that civil servants must always act in a way that is professional and that deserves, and retains, the confidence of all those with whom they have dealings. I think that has helped underpin the observation that Howell James made to the Committee when he said that we have had calm for four years. I think he said that he was not aware of disputes that had crossed his desk, and I think that is a good reflection of the health we are in.

Q525 ***Chairman:*** So, going back to when the Government took power in 1997 when Alastair Campbell was head and he, talking to the Government Information Office, said, "We've had a very successful operation in opposition and we intend to use the same techniques to ensure we get good coverage for government events and the Government generally", that is not your stance at the moment?
Mr Byrne: I think towards the end of Tony Blair's administration, there were increasing debates about the communicators and I think that is always an unhealthy situation because it will always provoke questions about the objectivity of information which is disseminated and communicated to the public, so, if there are steps that the Government can take in order to underline the integrity and the objectivity of information that is disseminated to the public, then I think that is all to the good. I am not a great analyst of these matters, so I could not really speculate as to why we have ended up in that situation, but I would just observe that by the end of Tony Blair's administration, we were having, it felt to me at times, more and more debates about the communicators rather than what was being communicated, so over the last year to year and a half with the changes that Gordon Brown has put in place, I think in some of those debates, the volume level appears to be a little bit quieter. I merely observe rather than analyse.

Q526 ***Chairman:*** In other words, you have moved on?
Mr Byrne: Have we moved on? Well, I think the atmosphere does feel different now to me in that I do not think we are having great big debates about communicators rather than what is being communicated, and in the last month I think I have observed that people are comfortable with the new arrangements. I am not sort of massively well-qualified to comment on the arrangements that were in place before because I obviously was not at the Cabinet Office then, but I think the changes that Gordon Brown has made are for the good.

Q527 ***Chairman:*** You are happy, are you? In your memorandum to us, submitted by the Cabinet Office, you say that government communications should never have been misrepresented as being party-political, and you are happy with that?
Mr Byrne: I think that is absolutely right, yes.

Q528 ***Chairman:*** How do you distinguish between what is party-political and what is government?
Mr Byrne: Well, I think that party-political communications stress, and emphasise, the role of a particular political party, and government communications stress the role of Her Majesty's Government. I think that is an important division, so it is not, and would not be, appropriate ever to have government press releases or civil servants talking about Labour Ministers doing X, Y and Z. I think Her Majesty's Ministers doing X, Y and Z, is of course fine, but injecting into discussion and communication a sense of which political party is leading the charge on any one particular front, I think, would be unwise and completely inappropriate.

Q529 ***Chairman:*** It seems to me quite a difficult line.
Mr Byrne: I think it is a difficult line, but I think it is a line that the Civil Service has managed pretty successfully for several decades, and I do not see—

Q530 ***Chairman:*** Well, several decades initially. I think we have just established that Alastair Campbell had a very different view of things and it does not seem to me that it was very successfully handled then.
Mr Byrne: I am not sure I could comment on that because perhaps I was not close enough to the centre of government at the time, but I think that during Tony Blair's administration there were a number of government communicators at work; they performed

their job very successfully and I think they maintained their balance and objectivity very successfully, but, under the forensic gaze of a much bigger and more aggressive media, my observation is that we had an increasing number of debates about the communicators rather than the message, and I think that is not a healthy development.

Q531 ***Chairman:*** If a press officer or a chief press officer felt that he was being asked to put over a party message, to whom would he complain?
Mr Byrne: Well, I think there would be a couple of different routes. I think the first route would be up through the Permanent Secretary of that Department, and obviously the Permanent Secretary of the particular Department could refer it to Sir Gus O'Donnell, as Cabinet Secretary, but, as head of profession, the Permanent Secretary in charge of COI, I think, could also play a role and I think a complaint would be pretty straightforward. If a press officer felt that they were being asked to do something which appeared to be in contravention of the Civil Service Code and the core values set out in the Civil Service Code, then they would have good reason for complaint, I would have thought.

Q532 ***Chairman:*** Mr Bishop, do you have any observations on this?
Mr Bishop: As I think I said before when I appeared before you last time, I have been in post for six years and certainly when I started Alastair Campbell was still at Number 10 and I have not personally ever experienced any party-political pressure.

Q533 ***Chairman:*** You joined in 2002?
Mr Bishop: At the end of 2002, yes.

Q534 ***Chairman:*** Although you do not deny, do you, that in 1997, I think I am right in saying, 17 of the 19 directors of information, the top of the office, in a two-year period were moved out?
Mr Bishop: No, I do not. As you have pointed out, I was not there myself at that time, but I think part of the issue then was that there was a confusion of concerns about politicisation also with attempts to improve and professionalise government communications. Phillis was still emphasising that point when the Phillis Review was published and said that there was still a further need to increase that professionalisation, so, as I say, I do not know exactly what happened in 1997 to 1998, but what I have observed has been a constant attempt to improve, and upgrade, the professional standards of government communications, and I have tried my very best to play my part in that.

Q535 ***Chairman:*** How do you check? You obviously look at the press every day, but do you ever check whether government departments are putting over a party view and, if you do not, who would?
Mr Bishop: Yes, the simple division of responsibilities now is this: that the Permanent Secretary would take the overall view on the propriety of press messages and the Chief Executive of COI is responsible for the propriety of all messages in paid-for advertising, obviously ultimately doing that in conjunction with the Permanent Secretary.

Q536 ***Chairman:*** So the Permanent Secretary might see a story or see a release or something of that kind and say, "Hey, you shouldn't be doing that"?
Mr Bishop: That could happen. I do not actually know myself of instances of that. On the other side of the fence where, as I say, I have been responsible for propriety for paid-for communications of all sorts, not just advertising, I can say that there have been no instances of party-political pressure at all and actually no mistakes of any seriousness, I do not think.

Q537 ***Lord Maxton:*** I am slightly confused here, because it does seem to me that it puts the government party almost at a disadvantage in terms of the media, because obviously the Cabinet Ministers are the party spokesmen as well as being Cabinet Ministers. If they go and do a party piece, it cannot be different, or, without there being a major controversy, it cannot be different from what the Government is saying, can it?
Mr Byrne: You would hope not!

Q538 ***Lord Maxton:*** Exactly, whereas the Government and obviously the opposition parties are clearly there presenting their party point of view, and it is much more difficult for the government party, therefore, to differentiate between what the Government is doing and what the party is saying about something, is it not?
Mr Byrne: Possibly, but I do not think that is anything new; I think that is just part and parcel of our constitutional arrangements.

Q539 ***Lord Maxton:*** That leads to my next question and that is that, since 1997, has government not been opened up in a way that was not the case before? We have gone away from the culture of secrecy around government which was very much part of previous administrations of all sorts, and one of the great things about this Government is that it has opened up government to public scrutiny in a way that was not there before?
Mr Byrne: I think there is an enormous amount in what you say, and, if you look at a number of different examples, for example, freedom of

information requests now mean that there are a great number of enquiries from the media, much greater flexibility in the media to seek information on a very wide range of matters, and, even if we look at what is often at the heart of some of these debates, even if you look at the Lobby, you can see how great changes have been made. Those lobby briefings are now obviously not on camera, but I think it is a great step forward that the transcript of lobby briefings is put on the website on the same day and anybody can actually have a look at questions that were asked of the Prime Minister.

Q540 ***Lord Maxton:*** And the Prime Minister's monthly press conference.
Mr Byrne: The Prime Minister's monthly press conference again has a transcript of that press conference put on the website pretty much on the same day, I understand, so there is an expectation of course on behalf of taxpayers and the public, in today's media environment when media channels are proliferating and people just expect a far greater degree of transparency, that the Government joins in the act and becomes more transparent itself. New technology does give us enormous opportunities to make sure that that transparency is delivered, so, although these initiatives might be small about putting transcripts on websites and so on and monthly press conferences, actually they do contribute, I think, to a culture of openness.
Chairman: Let us come to the Lobby in a moment.

Q541 ***Baroness McIntosh of Hudnall:*** I was just listening to what you were saying and thinking that one of the difficulties here is that the use of the word "information" implies something which can be accurate or inaccurate, but it is fixed, it is factual, it is comprehensible, and part of the business of government communication is indeed to inform in that sense, but it is also part of government communication business to persuade, is it not? Part of the difficulty, I think, that we are struggling with, and I am looking at Mr Bishop here because I know he has a background in advertising, is that the business of persuasion is a very sophisticated one and it is the Government's business to persuade a public, for example, to change its behaviour. Now, that could be a relatively uncontentious area, like drinking less or not smoking, or it could be in a slightly more politicised area, and the question for me, therefore, which is emerging is: to what extent are civil servants in the business of persuading as opposed to informing?
Mr Byrne: A very interesting question. I think you are quite right to say that government communicators will have to think about this question harder in future. One of the key things which Sir Gus O'Donnell mentioned, I think, to this Committee, but he has talked about it quite widely, is the role of government communicators in helping redesign services in the future—the example that you give of smoking cessation, and actually you could go back also to earlier campaigns at the Home Office around anti-social behaviour, for example, where you are trying to deal with people's behaviour. Again, I think ultimately there is no better substitute for coming back to the Ministerial Code and to the Civil Service Code and the emphasis that it puts on the principles of participation in public life and the expectations that it puts on civil servants to behave in an objective manner with integrity and, yes, to do the work of the Government, but not for a single second to veer into the business of trying to deliver some kind of party advantage. I think it is an important area for the Committee to highlight, but ultimately it is going to be values that are the best way through this. There is that sort of traditional example of how you keep a nuclear power station safe. Do you sort of require people, looking at the nuclear power station on a day-to-day basis, to go through 50,000 different sort of checks every day or do you actually just embed in them a culture of safety in absolutely everything? Now, if truth be told, it is probably the cultural predisposition that is your best guarantor of a certain outcome rather than lots and lots of checks, and that is why the Civil Service Code is absolutely at the heart of this debate.

Q542 ***Chairman:*** Would it be fair to say, therefore, as we come to the election that the precautions, using your nuclear example, should be emphasised as far as all government information service departments are concerned?
Mr Byrne: Absolutely right. I think there probably is a need to emphasise it as you approach an election, whenever the Prime Minister chooses to hold it, but I think it is a message that bears repeating at times when there is not an election looming either. Frankly, it is something that you have got to endlessly repeat; it is extremely important.

Q543 ***Chairman:*** The number of civil service press officers has grown from 216 since 1998 to something like 373. That is quite a big increase. Why has that increase taken place?
Mr Byrne: I think there are a couple of reasons. There has obviously been a communication revolution over the last decade and that means that there are now many, many more channels and there are many, many more media organisations and they are pretty hungry organisations, and the Government, I do not think, could put itself in a position where it was having to say to such media organisations, "Well, it's all very well that you have these demands on us for information and news about what we're doing, but, I'm sorry, we're not resourced to provide that service

to you"; that would be an intolerable situation. I was looking at this last night and the number of press officers, as you point out, has grown by about 72% and the number of radio stations over the equivalent period has gone from 204 to 453, which is, by my maths, up by about 126%, and the number of broadcast stations licensed to broadcast TV has grown from 57 to 940, which is a 16-fold increase, and the result of those changes means that the Government now faces out on 3,000 journalists at the BBC alone—

Q544 ***Lord Maxton:*** They are all in America!
Mr Byrne: —and 374 people in the press gallery, 1,500 foreign journalists and nearly 3,500 consumer magazines. They all make demands on the Government, and that is absolutely right. In this new world, people's expectations are that the Government responds to those organisations because those are the channels that people use to access their news and information about what the Government is doing with their hard-earned taxes, so the public appetite for information is exploding. I do not think it is going to diminish any time soon, and I think it is quite right that the Government does gear up to make sure that information about what the Government is up to—

Q545 ***Chairman:*** As we showed in our last Report, the fact that there are quite a lot of new outlets does not necessarily mean to say that there are a lot of people banging at your door asking for more information, radio stations being a prime example where, if they are music stations, they are not liable to be asking you much about the intricacies of health policy or nuclear policy.
Mr Byrne: I think that is true to an extent, but, nonetheless, what I found, for example, as Minister for the West Midlands over the last year, was that I was talking to, for example, a huge number of radio stations on a day-to-day basis. Many of them were music stations. They were not looking for terribly long contributions from me; they were looking for short and punchy sentences, but nonetheless, the demand and appetite is there.

Q546 ***Chairman:*** How many short and punchy sentences did you have to reply?
Mr Byrne: Well, I rarely got the chance to actually listen to what they broadcast.

Q547 ***Chairman:*** So really what you are saying is that the increase in numbers is because of increase in demand?
Mr Byrne: Absolutely, and the change in public expectations.

Q548 ***Lord Maxton:*** Do 24-hour news services, of which we now have several, mean that basically, whereas in the past presumably press officers worked from nine to five or put out the press stuff and then went home, now, with 24-hour news services, they have to be manned 24 hours, there have to be people on duty 24 hours a day?
Mr Byrne: That is absolutely right.
Chairman: There was never this wonderful world that Lord Maxton talks about of press officers being there nine to five, even in my day! They were there up until midnight.
Lord Maxton: All right, they are now there from midnight until six.

Q549 ***Bishop of Manchester:*** I want to ask you a question about budgeting, but, before I get to that, can we just explore this issue of staffing a little bit further because I want to narrow it down now to the communications staff in the Cabinet Office itself. Again, there has been really quite a significant increase there in the last 10 years from 23 to 38, as I understand it. Taking on board the points that you have just been making more generally about the civil service press officers, I wonder if you can define for us the range of responsibilities for those who are employed in this way in the Cabinet Office and give rather more specific reasons, if you are able to, as to why there has been that increase within this particular area.
Mr Byrne: Well, about one-third, I think it is about 29%, of the Cabinet Office's communications budget is devoted to media-handling, and there are three general reasons and three specific reasons for the growth. The general reasons are not enormously different from the conversation that we have just had, but they would include the new needs to publish electronic media, both the websites and other electronic media channels. Secondly, those staff are now serving a 24/7 media environment, and of course it is not just stories that might emerge in our own media any time of day or night, but the global interconnectedness of today's media organisations means that stories can surface anywhere in the world at any point in a 24/7 news cycle, so that is sort of the second general reason. The third general reason goes back to the arrangements for increased transparency which are now placed, particularly, around freedom of information requests, and which lead to a much greater number of demands made by the media, rightly—and not just about business at the Cabinet Office, but also at Number 10 as well. Those are the three general reasons. The three specific reasons merely relate to the increased scope and responsibilities that the Cabinet Office has taken on over the last while. The creation of the Office of the Third Sector at the Cabinet Office brought with it new demands for communications with a very wide

variety of stakeholders. It is perfectly right that they expect news and information about what the Cabinet Office is doing in that field. The second is that the establishment of the Social Exclusion Task Force in June 2006 also led to an increase in the appetite amongst national news organisations and also specialist news organisations in what was going on. The third specific reason is the shift of cross-government media co-ordination of security intelligence and resilience into Cabinet Office communications as well. There is not one single thing that I could point to and say, "It's that reason", but I think that actually there are some general reasons and there are some quite specific reasons as well.

Q550 ***Bishop of Manchester:*** Obviously, there are some very cogent points about an increase in staff, but where does this end? What is your current mathematical projection for the number of increases in staff between now and, say, 18 months' time when there may be a general election, or have we come to a point where now there are no more staff increases imminent?
Mr Byrne: It is a great question and one that I am not ready to answer yet because we are going into the process of business planning for the year ahead now, which will probably take two or three months and, like every other part of government, I will be looking for efficiencies, so I have already commissioned advice on what efficiencies it is possible to deliver in the communications area.

Q551 ***Bishop of Manchester:*** So we could, I think, face a decrease in the number of staff?
Mr Byrne: It is perfectly possible. I would not want to prejudge the development of the business plan of course, but I think it is incumbent in current economic conditions on every part of government to make sure that value for money is really emphasised with some degree of force behind Prime Ministers.

Q552 ***Bishop of Manchester:*** Earlier on, you mentioned the percentage within the budget for media-handling, and I know that all of this is public information, but it would just help as a shortcut if you were able to tell us the figures which are available for the budget of the Communications Department of the Cabinet Office and, although you have given a percentage figure, what the actual figure within that is for the media-handling.
Mr Byrne: Sure. It is £1.176 million.

Q553 ***Bishop of Manchester:*** That is overall or for the media bit?
Mr Byrne: That is for the media-handling component, so that is 29% of the Cabinet Office's communications budget, which is £4.069 million.

Q554 ***Chairman:*** Every time we ask this question of a government department, we get a reply which tells us what the cost is, but yet there does not seem to be an overall cost that anyone can give.
Mr Byrne: An overall cost of?

Q555 ***Chairman:*** An overall cost from government generally of all the departments.
Mr Byrne: Let me ask that question and see what I can furnish the Committee with.

Q556 ***Lord Maxton:*** Could I just suggest one possible explanation to you and that is that there are of course some other things press officers do which relate across several departments. We got that from the Department of Health, in particular, where they will do, say, a campaign on obesity which of course covers the Education Department and in fact I think they said it was five different departments. Does that blur it, if you like?
Mr Byrne: It certainly does, and there are also centrally managed communications channels. Directgov is a good example: Directgov, I think, has something like 274 different services on it at the moment and there will be services that contribute to Directgov from all parts of government, so it will often be difficult in terms of slicing and dicing up the numbers.

Q557 ***Chairman:*** But it does seem odd, because we have had the Ministry of Defence come in and they have given us their budget and they have given us the number of people they employ in the communications area, and the Department of Health and the Foreign and Commonwealth Office have done the same, three of the biggest departments in government, and now you have done the same. It should be possible. One is not asking for it down to the nearest pound, but it should be possible to get some rough estimate of how much the Government is spending on communications.
Mr Byrne: Absolutely, it is an extremely reasonable question, so let me see what I can put together for you.

Q558 ***Baroness Howe of Idlicote:*** Again, I am finding this fascinating as the figures are coming out, but what does slightly concern me is how you decide what is an appropriate percentage of the entire budget for your Department for communications, because, let us face it, you have got a lot of competing issues there that need the resources, and we all know we are going into a pretty tight time for any extra resources the other way. Could you give a little more guidance on that?
Mr Byrne: As the Committee will know, I have not been in this business very long, my background is in business, and budget-setting for these kinds of

overhead costs is always difficult, and you have got to look at the demand out in front of you. It is important that the Government satisfies media organisations by making sure that information and news is available. because they too have customers and those customers happen to be the people who elect the Government and pay our wages, so those demands are not unreasonable, they do need to be met, but obviously Ministers have to balance budgets, so I do not think there is a science to it. I think it is ultimately a question of ministerial judgment, but you are absolutely right to emphasise that at the moment and for the year ahead there is a new importance attached to people like me looking very hard at these cost bases and asking searching questions about how efficiencies can be delivered, but it will always be a balance: what portion of the demand that is out there do we satisfy. We do not want to be a closed, insular government that just sort of says, "Well, we'd love to tell you, but actually we're sort of retrenching communications staff and we just haven't got the resources to tell you the answer".

Q559 ***Baroness Howe of Idlicote:*** You do not think it might be fair to think that a rather higher proportion for communications could be interpreted as a better way of getting the party message, not just the government message, over to the country?
Mr Byrne: I am sure it could be interpreted like that in some quarters, and this is why the argument that Sir Gus O'Donnell began to advance is enormously important to build on. This is a very new argument, but, if you talk to front-line professionals in health, education and in teaching, all will say that prevention is better than cure and that, if we are to drive, for example, the public health agenda that Alan Johnson has set out, we are just not going to deliver on that agenda successfully unless we change people's behaviour, so winning an argument that says, "Communications budgets are actually now part and parcel of service-delivery" is really important, but I do think that it is quite a new argument and it is going to take some development and articulation, if truth be told.

Q560 ***Baroness Howe of Idlicote:*** It is obviously interesting, the whole business of special advisers, which of course started under previous governments and so on, but they have grown quite considerably, I think, from 38 at a cost of £1.8 million to 73 at a cost of £5.9 million. Now, can you give any sort of indication as to why you think that side of it has happened?
Mr Byrne: I think this is extremely interesting and I think there are three points that are important for me when I was thinking about this over the last week. I think the first point is to reiterate that the presence of special advisers, as many of the Committee will have had personal experience of, actually makes the Civil Service's job of staying impartial and objective much easier, because, if questions from the news and media organisations do begin to veer into the political, actually they have got a pretty clear signpost that they can point to: "That's not my job, as a civil servant, to answer that question, that's the special adviser's job to answer". I think that point was underlined well by Michael Ellam in the evidence that he gave to the Committee. I think the second point is that a key factor in the growth in the number of civil servants, I would observe, is through the creation of a bigger special adviser team at Number 10. Both Tony Blair and Gordon Brown were absolutely clear that they wanted to ensure that there was a strong centre in government, that the centre of government was setting the agenda for the whole of government and public service change and delivery, and that has been a key factor in the rise of the number of civil servants. The third point though is that my own experience of working with special advisers, particularly the team of special advisers at Number 10 that have been put together over the years, is that many of these individuals are quite extraordinary people in that the depth of specialist knowledge that they bring to their work in many cases is internationally recognised. They are all people who treasure public service and who believe in the ideals of public service, but have managed to combine that with extraordinary intellectual depth and presence as well. They are an impressive bunch of people, and actually I think having a strong centre is quite important in 21st-Century government, so growth there has been, but I think the prize of a strong centre has been worth it.

Q561 ***Baroness Howe of Idlicote:*** You have moved on to my second question too, but, even looking at the increase generally, you have mentioned the point about the specialism, but what proportion of their time would be spent primarily on the media and communications work?
Mr Byrne: This is an important question as well. At Number 10, of the special advisers that are at Number 10, only two are employed to deal primarily with the media and, of the special advisers employed across government, only 13 are employed primarily to deal with the media, so very much the balance of special advisers in government is skewed towards the development and articulation of public policy which, to me, feels right. I can understand from civil servants the argument that the presence of a special adviser to deal with the media is very helpful because it helps protect the integrity and impartiality of the Civil Service, but, on closer inspection, it would appear that the lion's share of special advisers in government are working on policy questions rather than answering phone calls from the fourth estate.

Q562 ***Baroness Howe of Idlicote:*** Sorry, I need to follow this up a bit more because 24 out of the 73 special advisers today are in fact working at Number 10, working on policy at really quite considerable cost overall of everybody we have got of £1.8 million. How much of that really is justified rather than should be paid by the party itself if they are special advisers?
Mr Byrne: I think the costs are right, and, if you ask members of the media what fraction of Number 10 people they thought were devoted to the media, I doubt they would guess actually that only two of those 24 are employed primarily to deal with the media, but those are the facts. Again, I think a strong centre in government is a prize worth having and I think, if you can bring together the range of specialists that Gordon Brown has brought together, that is a prize worth having because I think public policy is better for it.

Q563 ***Baroness Howe of Idlicote:*** You are not concerned about the amount of public money as opposed to party money? Is all the work they are doing governmental as opposed to party? One is assuming that special advisers have got a rather different role.
Mr Byrne: No, I am pretty convinced that the prize of a strong centre is a prize worth having. Obviously, it is important not to go mad with the budgets, and the number of special advisers at Number 10 and indeed across government is now lower under Gordon Brown than it was under Tony Blair, so it is important that these costs are not allowed to run out of control, but I think the balances in the budgets that we have got at the moment are right.

Q564 ***Baroness Scott of Needham Market:*** One of the topics we have discussed at several sessions and taken evidence on is the question of selective briefings and particularly the sort of examples where the Minister has a chat with a journalist and trails some new policy, and a number of journalists from whom we have heard were quite sanguine about that. They said, "Well, it's inevitable, it's just part of the system", but we have also heard a less sanguine view which says, "Well, actually, how can you square this approach with the Phillis recommendations of openness?", so what are your thoughts on this question of selective trailing?
Mr Byrne: Three thoughts really. The first is that the number of journalists in the Lobby is high, so there are 374 members of the press gallery, for example, on top of foreign journalists, which number about 1,500, and that is quite a lot of people. If truth be told, not all of them are interested in everything and there will be specialists within their number, and you have heard from a few of them, so selective briefing, I think, is inevitable because some of them will just be more interested in certain subjects than others. Many of them have got extraordinary depths of knowledge, expertise and experience on some of the policy questions that they write about, so sometimes it will make sense for government communicators to spend a bit of time with a handful of people who actually know their subject inside out and are genuinely interested in it than banging out a press release for 374 people in a sort of blanket kind of fashion. Some of the questions that the Government needs to explain are complicated. If we want to avoid a situation where we are dumbing down explanations of government policy, then often it will make more sense for government communicators to spend a limited time with a select number of people who really know their stuff and, frankly, who are pretty-well-qualified to ask more searching and more demanding questions and who will hear messages and listen to them and have plenty of salt to pinch when they are listening to what they are being told.

Q565 ***Chairman:*** I think what we are trying to get at is trailing announcements. Obviously, we understand that the health correspondents might be more interested in health, but it is the trailing of announcements to one or two newspapers or to one newspaper or before it is made in Parliament, that is what we are trying to get to.
Mr Byrne: I think trailing is probably always going to go on, but I think concern about trailing sometimes can be a bit overdone. If truth be told, the way that policy is made now is pretty open and pretty collaborative. There are in this business very few bolts from the blue, and very often policy announcements, even when they are made to everybody, are not going to win prizes for originality because actually there would normally have been an open consultation process. It is typically in the Cabinet Office's guidelines that the Government has to publish a response to consultations, and actually that is a perfectly sensible way of making policy in the 21st Century, but it does diminish the originality of policy announcements when they are made. The question that you get stuck in is: when is a trail a trail? Is a trail when you launch a policy consultation? Is a trail when it closes? Is a trail when you publish the Government's response? Is a trail when you announce the direction of government policy? When is a trail a trail, because a lot of these things will be conducted in such an open way? Increasingly, we see different parts of government asking civil servants to speak about operational matters in the media, but also to a much wider range of stakeholders, and very often you will have media in those organisations. I remember having these kinds of conversations when I was at the UK Border Agency. The general culture of transparency now, I think, does sort of pose questions about when a trail is a trail. I know the

question that you are driving at, but I just think, having thought about it, that it is probably never really going to go away, because policy is just not made in dark rooms any more: policy is made in an open and collaborative way, and policy is stronger for that.

Q566 ***Baroness Scott of Needham Market:*** The journalists from whom we took evidence are very clear that trails, however defined, take place and that it is a perfectly accepted piece of practice that Ministers will talk to a journalist whom they regard as understanding or receptive.
Mr Byrne: Or both.

Q567 ***Baroness Scott of Needham Market:*** Or both, yes, and it may mean politically or it may mean technically, but the fact is that they accept that it goes on, so the question I am asking, and I think you have answered, is that actually it can be justified. I think that is what you have just said, so perhaps you could confirm that.
Mr Byrne: I think it can be justified. I think, to a degree, it is inevitable, and actually I do not think it is necessarily a bad thing. Just the sheer complexity of today's media environment poses new questions about how government communicators get their messages through to taxpayers. There are now significant groups of taxpayers who just do not buy national newspapers and who do just listen to the radio or who do just access information through websites, so sometimes government communicators have to make quite difficult judgments about how you best connect with the audience that you are trying to reach, so I suspect it is going to remain quite a complicated story.

Q568 ***Baroness Scott of Needham Market:*** Just to follow on then, if you have, I do not know, 20 health specialists on your books and your Health Minister decides to talk to one of them above the others, would a briefing to one health specialist only be appropriate from a special adviser or a Minister, or would it be appropriate for a civil servant to give that sort of briefing?
Mr Byrne: Interesting. I think that, if it is a substantial announcement, then it should not be selectively briefed at all, it should be brought to the House first and foremost. The number of oral statements is increasing now, and I think both the Prime Minister and the Speaker have been pretty clear about their expectation of Ministers, and they are absolutely right to set out that expectation, but, if an announcement is of less substance and less import, then sometimes there will be selective briefings, and actually I think sometimes it is justifiable for civil servants to undertake selective briefings, so, if you are dealing with a particularly complicated piece of policy or, for example, you are publishing an evidence paper, then sometimes the civil servants will be just best-qualified to provide members of the media with an explanation of what the Government is doing or what the Government is trying to get across.

Q569 ***Chairman:*** Should the same information not be available to everybody? That is really the point. Why should you actually choose one person? Should it not be a general principle that, when information is published, it should actually be published for everyone?
Mr Byrne: Absolutely, and I think that is the general principle that governments should operate by.

Q570 ***Bishop of Manchester:*** As we get nearer to an election, the trailing of information to particular newspapers, for example, begins to take on not merely government information aspects, but potentially party-political propaganda. Now, do you, at the Cabinet Office, keep a close eye on the balance between the particular newspapers or whatever in the way in which that information is delivered because, as we approach these 18 months, if certain newspapers are beginning to get more information trailed to them than others, that is actually rather a serious issue?
Mr Byrne: Interesting. That is something that I possibly do need to reflect on because I can see the argument that you are making and it is an important argument. Sometimes though, political selective briefing can be about ambitions for policy rather than the reality of policy, and that is why it is quite a difficult line to tread, is it not, because sometimes you will have Ministers who might want to take policy in a certain direction, but actually what they are doing is they are having a political argument, so, if you take, for example, an important part of my party's policy-making process, which reaches a sort of climax every couple of years with a conference at Warwick, very often you will see in the newspapers politicians, trade unions and party activists talking to the media about the debates that they are having. Now, very often people are having an argument about politics and our civic life is healthier for it, so sometimes it is just quite difficult to separate what is a policy and political ambition from, "This is what the Government is going to do next week".

Q571 ***Lord Maxton:*** But is not some of this selective trailing actually down to the journalists rather than to the civil servants or Ministers or press officers? In other words, if a journalist discovers or thinks that there is something about to happen, so he phones up the press office and says, "Is this about to happen?", what do they do? Do they say, "No", and then two hours later it is announced, or do they say, "Yes, this

is what's happening"? Why should that, if you like, better journalist be prejudiced against those if you then give it to everybody?
Mr Byrne: You draw attention to quite a point, which is that members of the media are very competitive individuals, and I have personally been on the receiving end of phone calls from journalists who have said, "Well, are you going to do this?" and actually the right position at that stage, because there might not be cross-government policy agreed, is that you might say, "Well, I'm not in a position to comment on that", so the story is then, "Minister refuses to deny", and that is then your headline. You would not call that media-fabricated news, would you, but it is certainly media-driven headlines.

Q572 ***Chairman:*** That is simply what actually happens in the relationship, and your response seems to me to be the correct response. Let me give you an example of October 24. There was a debate, which I think Lady Scott and others will remember, in the House of Lords about change of policy and allowing women to buy back contributions to get a full pension, and that was debated in the House of Lords at the committee stage and then, lo and behold, on October 24, although no amendment had gone down in the House of Lords, it was announced on the front page of the *Daily Mail* with the Secretary of State actually being quoted in some detail. Now, that is actually pre-announcing something, by definition. Do you defend that kind of thing as well?
Mr Byrne: I am not familiar with that story, although I will have a look at it now you have drawn it to my attention. I think I would just underline what I said a moment or two ago about the importance of significant policy announcements being made to the House first rather than to the media.
Chairman: Well, let us come on to that point in particular, the primacy of Parliament.

Q573 ***Baroness Eccles of Moulton:*** It has been very interesting to listen to the discussion so far, Minister, but it seems that the direction that it is going in means that transparency really makes confidentiality a very difficult principle to maintain. Quite often documents are embargoed, but, if, as you say, so much of the information that is in that document is already common knowledge because of the degree of consultation, transparency, openness, et cetera, it then brings us to the point of wondering really whether the primacy of Parliament can continue to be respected and what is a new policy announcement that has remained so confidential that it does not need an embargo and Parliament hears about it first? How can you construct a principle which actually preserves what, I suppose, is still considered in many people's eyes as a very important factor in the way the country is governed?
Mr Byrne: That is a fantastic question. I think it is always going to be a matter of judgment, but I have found, in my very short career as a Minister, that I do find myself thinking about accountability to Parliament every single day. It is something that infuses the way that you work. You are constantly asking yourself, "Am I being presented with something or am I making a decision that Parliament needs to know about and where Parliament needs to be informed?" I think what you have also seen good Ministers do over the years, and no one administration can take credit for this, but what good Ministers do is they use the House in order to debate questions that are not fully formed. An example from my own experience is with the big changes that we were making to the immigration system on which I asked for a topical debate in the House about the advent of the points system, and actually our policy was far more sophisticated and richer for the debate that we had in the House, so the House authorities making time for Members of the House to debate these things is very important and something that Ministers should exploit, I think, because I think policy is better for the experience that is brought to bear in both Houses. This question though of transparency is an interesting one because you suggested that a trend was in a certain direction and I was sort of fascinated by this question to do a little bit of research. This is not necessarily a sort of all-encompassing answer, but I do think that prime ministerial statements to the House do give us an indication of the direction of travel. I looked back over the last four Prime Ministers and just looked at the number of oral statements they made to the House. Lady Thatcher made one oral statement every 24 days on average, Sir John Major made one statement every 23 days on average, Tony Blair made one statement every 19 days on average and, in his short tenure as Prime Minister, Gordon Brown has made one statement, on average, every 11 days, so I think you can see that the trend is actually towards greater accountability towards Parliament and I think that is very welcome.

Q574 ***Chairman:*** You are just using the prime ministerial statements, are you not?
Mr Byrne: Absolutely, which, as I say, is but one base point.

Q575 ***Chairman:*** You are missing out every government department in the land.
Mr Byrne: Well, there have been 114 oral statements since the end of June 2007, so, if you count the total of oral statements, you can see that we are not, in the House, short of oral statements at the moment, but this question, I do think, requires constant invention on the part of the House authorities. I think the

advent of Westminster Hall debates has been an important contribution and I think the advent of topical debates and topical questions on the floor of the House is an important innovation, but this is not something that is going to stand still. I am constantly struck by my limited knowledge of policy questions in relation to Members of the House, and the more that Ministers can use the House in order to thrash through difficult questions, in my view, the better.

Q576 ***Baroness Eccles of Moulton:*** That does give rise to a question which is not actually part of what we have written down to talk about, but it is strictly relevant to what you have just said, using the House in order to help to form policy, and that is the fact that in the next session we are told that we are going to be sitting for fewer days than we have since the Second World War, apart from the years when there is a general election. Does that not rather run counter to having enough time to openly and productively discuss policy proposals in the House?
Mr Byrne: Not necessarily, because this is always a question of supply and demand. We have now been given our supply in terms of the number of days available, but what we have not yet been given is our demand in terms of the Government's legislative programme, so the Queen's Speech, I think, will be an important opportunity to answer that question in the round.

Q577 ***Lord Maxton:*** Is some of this whole question about Parliament and making statements to Parliament not in part due to the increase in the media? If we take the statement yesterday by the Health Secretary on the provision of drugs being paid for by individuals, that has been an ongoing debate for several weeks in the media and the public, and quite rightly so. It would have been absurd for Alan Johnson not to have said anything. I am sure journalists were pestering the Department of Health yesterday before the statement to find out what it was about. It obviously was going to be about that. What else was it going to be about? Do you see what I mean? It just opens up the whole area of thinking. At one level governments are accountable to the electorate as well as to Parliament.
Mr Byrne: Your point underlines the importance of making major policy amendments to the House first. In the spirit of the way in which policy should be made in the twenty-first century, I do think there are new ways in which you can pool expertise and analyse it, chew it over, think about it and reflect on it. Obviously the advent of digital media presents all sorts of new opportunities to do that. The House is a pretty good place to do that in as well in my experience.

Q578 ***Chairman:*** So you defend the traditional view that important announcements—and I agree that there is always some debate about what is important and what is not—should be made in the House first?
Mr Byrne: Yes. I did not expect to come to this Committee and admit I was a traditionalist, but you seem to have boxed me into that corner!

Q579 ***Baroness McIntosh of Hudnall:*** Minister, I am going to try and wrap up the last few questions into one portmanteau question which you can pick the bones out of as best you can. You spoke in your opening statement about the importance of what you called the digital divide and we have referred to it in that way too. I think you mentioned 10 million users of government information via websites. What proportion of the total amount of information that the Government is putting out is going through websites and is not available by any other means? What view do you take of the people who are not at the moment, for various reasons, able to access information in that way? You will have read the evidence that we had from the Citizens Advice Bureau on that subject. Are you monitoring whether or not your information is getting through by other means to people who do not have access to digital forms? The Citizens Advice Bureau is an example of a voluntary sector organisation that is extremely important in delivering information which, if not directly coming from Government, is connected to government services. They are very concerned that the relationship between government departments and them as providers of a service is not particularly well integrated. I wonder whether you have any reflections on how the third sector, which is now an important part of your brief, can be better integrated and involved in the business of delivering government information effectively. Finally, connected to that is the question of cross-departmental issues such as the availability of benefits. This is an issue which the Citizens Advice Bureau pointed out was very important, that people who are trying to access one kind of benefit or a tax credit are not necessarily being informed through another department that they might be eligible for something else. That is just an example of where government information may fall down into the cracks between different kinds of departmental communication.
Mr Byrne: This is an area where I personally would very much welcome the Committee's observations because, as I said in my opening statement, this is a question that is going to become more significant over the next 10 years rather than less significant. I spent most of my business career in the technology sector. The advent of new technology does allow us to create different kinds of packages of services and different kinds of packages of information that are

much better customised and tailored around the individual or indeed an individual community. If we are to do that as effectively as we might it will very often require working with third sector organisations who have just got a much better insight and a much better connection with the communities or individuals that we are trying to reach. My colleague Tom Watson has led what is an absolutely pioneering field of policy development at the Cabinet Office over the last year around the power of information, which is a demand on government really. It is about how the Government makes sure that it is releasing information that it might have in one form or another out there into the atmosphere so that intermediary organisations can package it, put it together with other things, bundle it with other services, in order to provide a certain kind of service to certain individuals. Netmums is a good example of an organisation that brings together a whole range of government information, with some government services, with a whole range of advice and information too into a service that is pretty well tailored to the audience that it is trying to serve. That is quite a complicated question, but if you have got people who are sitting outside those opportunities, for example, who do not have access to the internet or electronic media, then you are going to get a new inequality in service delivery. That is a very long way of saying that this is an important area on which I would welcome the Committee's observations. It is important not to lose sight of the fact that there are 32 million people online, that is 67% of the UK population and so the internet will remain an important service delivery channel for public services. If you are asking what monitoring we do of how government is delivering these services to different people in different ways, well, that is ultimately down to individual departments to answer because they have to be held accountable for whether their services are being delivered in the right way. In David Varney's proposals around modernising government that were published a while ago there were a set of principles in this field, the most important of which was that when you are thinking about service delivery mechanisms your key test is whether the people you are trying to serve can actually get access to it. Sometimes that will mean help-lines, sometimes it will mean the internet, sometimes it will mean physical service delivery channels, sometimes it will mean retaining the good old fashioned stuff called paper, and sometimes it will mean working with third sector organisations in a new way. For example, if you look at the way in which the Eaga Partnership worked on the Government's warm front programme, there is a third sector organisation which works in constituencies like mine which has much better marketing techniques than different parts of government. It can tell me on a day-to-day basis what warm front grants have been delivered in my constituency, and they are also now working with the fire and rescue service in installing fire alarms to prevent fires. There will be a whole range of ways in which these services can be put together in different channels. The key test for departments, Ministers and civil servants is who is it that you are trying to reach, tailor the way you are trying to deliver services to your audience—

Q580 ***Baroness McIntosh of Hudnall:*** The number that you gave, which is 67% of people have access to the internet, is pretty much exactly what the Citizens Advice Bureau told us in a different way, that is, they said 35% of people do not. They also confirmed that a very significant proportion of the people they deal with, that is to say, people who are generally speaking in need of help and support, fall within that 35%. In your view is it the business of government, because of the way internet and digital technology is developing, simply to press the remaining 35% of people who cannot at the moment access that kind of information to do so by some means or another? One mechanism for doing that would be to withdraw other forms of information so they have got to somehow. I am not suggesting that is what you do but that would be one way. Or do you take the view, for example, that there will always be a quantum of people for whom that kind of accessing of information is not going to be appropriate for one reason or another?

Mr Byrne: I take very much the latter view. Part of the answer obviously is increasing the penetration of internet services. That is why we have got three Ministers who are working on digital issues; Paul Murphy is the Minister for Digital Inclusion. There are important programmes, for example, the Home Access Programme that DCSF is running, which are driving up the penetration rates for internet services, but that is never going to be 100% of the answer. So in a constituency like mine, for example, which has the fourth highest unemployment in the country—two wards out of four are amongst the most deprived wards in the country—rates of internet penetration are very low. That means I might be able to deliver certain kinds of advice through liambyrne.co.uk, but it also means I need to do monthly surgeries, it means I need to do school gate surgeries once a week, it means I need to do resident meetings twice a month and, of course, I have to knock on doors and ring people up. There is a whole range of different ways in which modern service deliverers have to go to the people they are seeking to serve. For some services for sure the internet is a good way of doing it. Directgov provides 240 services from eight departments; it serves 11 million people and it is very good at providing a range of different services all in

one place. At your other extreme are initiatives like third sector organisations like Eaga Partnership, which are delivering information and guidance about warm fronts or fire alarms. What they do is go and knock on people's doors in target areas.

Q581 ***Baroness McIntosh of Hudnall:*** Are they able to access government information effectively to do what you need them to do, because that is part of the same issue?
Mr Byrne: There is always going to be enormous room for improvement in these areas, but they will be able to access services. One of the most exciting new areas where government and public sector reform will be able to support third sector organisations in helping deliver government services is by actually studying harder what tools third sector organisations would find useful in delivering those services. Sometimes those tools will be online. For example, if you are a travel agent you will have access to the Sabre booking system. That is a system that is provided by a consortium of airlines; it is on travel agents' desks. That is the sort of tool that they can then brand and customise and use how they see fit. In the future there will be electronic tools of that nature which will help third sector organisations or indeed other organisations deliver services more effectively. This is very much a spectrum. The overriding principle has got to be who is it you are trying to reach and how do you deliver services in an integrated way, which was another point you made.

Q582 ***Lord Maxton:*** There is a debate about top-slicing the BBC licence or whether when we get to digital switch-off there will be part of the licence there. I would argue that rather than using that to subsidise other broadcasters, it should be used to ensure the provision of broadband to every household in the country, which would then allow everybody to have internet access. Secondly, internet access is available in public libraries, in CAB rooms, but there is the question of personal security in all of those. Does not the Government's policy of providing ID cards come close to overcoming that particular problem?
Mr Byrne: I think it does. When I was the Minister with oversight strategically for ID cards one of the things that I was very anxious to do was make sure that the Government's policy for identity and identity management embraced online services like Directgov, the Government gateway, because it will be increasingly important that people have a secure way of locking down their identity, but the way that you want to use that proof of identity for government services needs to be as flexible as possible. If you have got the ability to interoperate ID cards and the Government gateway then you are providing a service to potentially 11 million people. That is quite a significant prize, particularly with the new security features that it is possible to bundle into that service.

Q583 ***Chairman:*** Would it be within the remit of the communications network to publish guidance on working with the voluntary sector to improve communication with the public and getting clear advice available to the public on government initiatives?
Mr Byrne: I think it would. I think this is something that I will ask the Office of the Third Sector in the Cabinet Office to work with COI in thinking through, because I think that suggestion from the Committee would be positive.

Q584 ***Chairman:*** I want to ask about the lobby system. You referred to the greater openness that there is now, but you did say that the lobby meeting, which is open virtually to everybody, is not televised. Why is it not televised?
Mr Byrne: I am not enormously well qualified to comment on this so I will defer to the professional judgement of others. I think that this is a conversation that the Prime Minister's Official Spokesman Michael Ellam has had with members of the lobby. I think the conclusion that they reached was that they would all feel more comfortable if they were able to conduct their business in a way that was transparent but not necessarily televised. On that question I would defer to their judgement. What is important is that you do not get yourself into a situation where you have got members of the lobby not feeling comfortable in their working environment and therefore not coming along to—

Q585 ***Chairman:*** These are journalists we are talking about, not old age pensioners!
Mr Byrne: You know, like me, they are pretty sensitive individuals.

Q586 ***Chairman:*** Mr Bishop, it is unfair to ask you, but you are not staying in the government service forever, are you?
Mr Bishop: No. I am moving on at the end of January. I have got the great honour of becoming Chief Executive of the Southbank Centre.

Q587 ***Chairman:*** So you can give a frank answer before you go.
Mr Bishop: I hope I have always been giving you frank answers.

Q588 ***Chairman:*** And what is it, about televising the lobby?
Mr Bishop: I must admit, you saw a smile on my face because the thought crossed my mind that these days

television channels, all of them, including the BBC, do chase ratings and I was wondering what sort of audience that might get.

Q589 ***Chairman:*** Assume you get extracts. You do not have to cover the whole thing. Even in Parliament you get extracts of it. I think I am getting the message that as the lobby does not really want it you are not really prepared to push it.

Mr Byrne: I do not think so. I would be extremely nervous about damaging the lobby's comfort level in their interactions with government.

Q590 ***Chairman:*** I think that is exactly what I just said. Thank you very much for coming. We have enjoyed our conversation with you. Perhaps if we have got any other questions we could come back to you.
Mr Byrne: Thank you very much.

Supplementary letter from the Cabinet Office

GOVERNMENT COMMUNICATIONS

At the committee hearing on Wednesday 5 November, I promised to look into giving you an overall figure on the cost of government communications.

As you know, individual departments are responsible for determining their own budgets, resourcing and structure. As such, the communications function in each department does not always fit into a single directorate with a single budget.

Comparing the cost of government communications across different departments is therefore complicated and likely to result in a distorted overall figure—what some departments include as communications activity, others do not.

For accurate information that highlights general trends in government communications spend, I kindly refer you to the information previously provided to the committee from the Central Office of Information.

I understand that you may find this response disappointing but I do hope that the data provided thus far will be sufficient for the committee to complete its much anticipated report.

26 November 2008

Written Evidence

Memorandum by the Chartered Institute of Public Relations

Introduction

1. The Chartered Institute of Public Relations (CIPR) is the UK's leading public relations industry professional body and offers international leadership on issues of best practice and ethics. Founded in February 1948, it today has over 9,000 members representing the public, private and voluntary sectors.

2. We are a member of the European PR federation CERP (Confédération Européenne des Relations Publiques) and a founding member of the Global Alliance for Public Relations and Communications Management, representing over 60 national public relations associations, of which our Director General Colin Farrington is currently Chairman.

3. The Institute represents and serves the interests of people working in public relations in the UK and abroad. We offer access to information, advice and support, and provide networking and training opportunities through a wide variety of events, conferences and workshops.

4. We are about developing skills, raising awareness, rewarding excellence, supporting our members and giving public relations a voice at the highest levels. Our staff is dedicated to providing support for our members and enhancing the professional reputation of the industry.

5. We frequently speak at national and international conferences, provide comments to the press and take an active part in influencing new regulation concerning the industry, both nationally and internationally.

6. We are specialists in PR training and experts on conference management and seminars. Each semester we offer an extensive programme of training and events covering the most relevant topics of the PR profession.

7. In addition we offer the post-graduate vocational CIPR Diploma and the Advanced Certificate courses in public relations, and approve PR courses at undergraduate and postgraduate level at universities throughout the UK.

8. Our aims are:

- to provide a professional structure for the practice of public relations;
- to enhance the ability and status of our members as professional practitioners;
- to represent and serve the professional interests of our members;
- to provide opportunities for members to meet and exchange views and ideas; and
- to raise standards within the profession through the promotion of best practice—including the production of best practice guides, case studies, training events and our continuous professional development scheme "Developing Excellence".

9. Our evidence is based on consultation and discussions with a wide range of our diverse membership, including serving members of the Government service, under the supervision of our Professional Practices Committee and carried out by our Policy department.

Our Main Findings are

10. The professionalism of communication within the Government service has improved since the Phillis report. There are some outstanding examples of excellent work. But performance is patchy, due largely to a de-centralised professional structure, disparities in budgets and the commitment of senior officials and Ministers. Training and professional development schemes are there in structure but not always implemented with vigour. Departments have also varied greatly in understanding and grasping the implications of social media. There remains an attachment to established ways of doing things, including the out-dated and unaccountable lobby system.

11. If necessary we would be happy to provide oral evidence to assist the inquiry. We hope however that the following responses to the specific questions are helpful.

A Redefinition of the Role and Scope of Government Communications

> *"Our central recommendation is that communications should be redefined across government to mean a continuous dialogue with all interested parties, encompassing a broader range of skills and techniques than those associated with media relations. The focus of attention should be the general public" (page 12).*

12. Our experience is that there has been a re-balancing of the communications portfolio within Government to a certain extent. Communicators are now using a broader raft of communications channels and techniques, including direct contact with the public. However the focus of some senior officials and Ministers still seems to be on "telling" the public and getting their name or policy in the media rather than engaging with them and using other channels to engage in debate.

13. It also needs to be understood more fully that public relations can be properly evaluated and should not be seen simply as an add-on to advertising, which can be wastefully expensive and ill-targeted. Government communications should strive always to be transparent, ethical and professional and much of it is. But there is still a long way to go before the notion of "spin" or "burying bad news" is forgotten. In the past the worst culprits were former journalists who were catapulted into public relations positions without a grounding in the profession; or special advisors with no communications background or skills. We feel that good training could go a long way towards addressing these shortcomings.

A Strong Central Communications Structure

> *"We have recommended, and the government has already accepted, a new structure, led by a new Permanent Secretary, Government Communications who will be Head of Profession, provide strategic leadership for communications across government and build a new and authoritative communications service within government. The Prime Minister's Senior Official Spokesperson will report to the Permanent Secretary, Government Communications, and will work alongside the Prime Minister's Director of Communication" (page 12).*

14. The appointment of a Permanent Secretary was certainly a positive and necessary step and has helped to assert the neutrality of the civil service role in communications. It has also ensured that communications has been recognised as a strategic asset and activity within government requiring representation at the highest level.

15. The formation of the Government Communications Network (GCN) has also enhanced the position of professional communicators in the civil service by providing leadership, access to training and support to departments which has improved capability. However there have been signs of departmental resistance and the protection of departmental 'fiefdoms'. Communicators need to have a professional status equivalent to accountants, statisticians, lawyers etc, including standard and compulsory training and education, recognition of professional structures etc, within the Government service. Unfortunately, despite the best efforts of Howell James, this has not to date been achieved.

Strong, Integrated Departmental Communications Structures

> *"We found inconsistencies between departments on the significance attached to the communications function. We recommend that, led by the Director of Communication, each department's communications activity must clearly contribute to the achievement of the department's overall policy aims and objectives" (page 15).*

16. There has been a significant improvement in the structure of communications within Departments; inconsistencies remain with some departments performing better than others.

17. In some, particularly the outward-facing and delivery departments, communications has been re-positioned and resourced as an important function with an increasing number of Communications Directors taking on more senior roles. However, there are still a number of departments that neither position and resource communications appropriately nor do they appreciate the contribution that communications can make. In this respect the civil service has fallen behind best practice in industry, where the director of communications almost invariably has a seat at the top table.

18. Likewise, there has been a notable improvement in communications practice across government departments: practitioners are more skilled and more responsive. However, the picture is not uniform. While there are many instances of departments displaying consistently good practice, there are still some departments that do not.

19. An example of successful co-ordination of communications between departments is the handling of the recent foot and mouth outbreak. In addition we have appended with their agreement two current government communications case studies taken from the CIPR Excellence Awards 2008—each of these has been short listed in an open competition and represents best practice in their field. They show what Government departments can achieve by winning awards in an open competition.

Greater Emphasis on Regional Communication

> *"Research told us the public want information that is more relevant to them and where they live. We recommend that more investment should be made in communicating at a local and regional level and more communication activity should be devolved into relevant regional government or public service units" (page 18).*

20. There is in the view of our advisors still work to be done to improve regional communications to connect local people to national agenda issues. Generally communications are initiated, driven and controlled by the centre. The Central Office of Information (COI), with its strong regional network, should play an enhanced role in devolving communication activity.

21. Equally there are some exceptions which deserve praise for the work they have done. There is evidence of best practice from the Environment Agency, which has been short listed in a number of categories and across a number of regions in the 2008 CIPR Pride Awards which recognise public relations success and achievement in the nations and regions.

Recruitment and Training to Raise Professional Standards and Maintain Civil Service Impartiality

> *"We found inconsistency in recruitment and inequality in training opportunities. We recommend that all communication specialists should be recruited to the same high standards. All those involved in communications should have training that allows them to perform in a professional and effective manner. Ministers should not be involved in the selection process for communications professionals during open, external competitions" (page 19).*

22. We regard this as a key issue. The GCN has approached the CIPR to explore the opportunity to offer government communicators membership of the CIPR as a way of encouraging them to engage with their professional body. This coincides with the launch of GCN Evolve, an online personal development framework that helps government communicators assess their PR and communications skills. Launched in July 2008, this initiative provides government communicators who have assessed their professional skills through completion of their Evolve profile, the opportunity to join the CIPR at an attractive rate, and take advantage of all the membership benefits afforded to its members.

23. Discussions are in hand with the CIPR's membership and education teams to explore how the CIPR's Continuous Professional Development (CPD) programme can be mapped directly with the Evolve framework. There are also joint initiatives to promote Evolve at workshops running throughout July, August and September 2008. This is a clear indication that GCN recognises the value of the CIPR, and we see it as the start of a much closer working relationship with Government communicators across a broad range of departments.

24. The CIPR welcomes the establishment of this initiative. Membership of the relevant professional bodies is a key element in raising professional standards. Although government communicators are members of GCN, being a member of a professional body provides many other training and development opportunities and also gives communicators the opportunity to meet and share best practice with practitioners from diverse sectors. They are learning about and from PR practice in other fields and in other contexts—which also provides opportunities to benchmark practice and experience with what's happening in the rest of the PR world. Otherwise it's easy for government communicators to live in a "gov comms bubble", with no outside references.

25. Membership of the CIPR means signing up to its Code of Conduct which is broadly consistent with the Civil Service Code. http://www.cipr.co.uk/Membership/conduct/index.htm. The Code emphasises that honest and proper regard for the public interest; reliable and accurate information; and never misleading clients, employers and other professionals about the nature of representation or what can be competently delivered or achieved, are vital components of robust professional practice.

26. There is now greater consistency in training with the GCN playing a key role here. This is an area that deserves positive recognition and indeed is being used internationally as a model of good practice.

27. The CIPR has worked with government departments to provide bespoke in-house training including:

- providing the Foreign Office with the "International Communications Skills Training" programme around nine times a year (six in the UK and three overseas). Each of these courses comprises five modules and lasts for a week. As well as FCO staff, these courses have also attracted candidates from the Home Office and Department for International Development;
- a bespoke course for the Office of Criminal Justice Reform on low budget PR;
- training for the Health and Safety Executive on Social Media and Evaluating PR; and
- a PR strategy workshop for the Home Office in 2007.

New Rules Governing the Conduct of Special Advisers and defining more clearly the Boundaries with the Civil Service

> *"We accept the role of special advisers but found a lack of clarity in their relationship with civil servants. We recommend that new propriety guidelines and induction training should be developed by the Permanent Secretary, Government Communications to cover all those involved in communication, including special advisers. The principle of Civil Service impartiality must underpin these guidelines" (page 21).*

28. In spite of attempts to categorise and regulate the roles of special advisers there is still confusion and friction about their relationship to the civil service. The notion that special advisers are civil servants (albeit temporary ones) should be scrapped, and it should be made clear to civil servants and the general public that their appointments are purely political. Their new status should be made transparent to the public, and to other stakeholders with whom they have regular dealings. They should never be given posts that enable them to direct civil servants nor should they supplant professionally qualified communication staff.

Effective Implementation of the Freedom of Information Act 2000

> *"We found a culture of secrecy and partial disclosure of information which is at the root of many of the problems we have examined. We recommend that, when implementing the main provisions of the Freedom of Information Act, the overriding presumption should be to disclose" (page 23).*

29. It is still not clear whether there is a consistent position on disclosing information so this needs to remain under close scrutiny.

Clearer Rules for the Release of Statistical Information

> *"We found cases of selective release of information and lack of clear timetables as to when information was to be released. We recommend that core central government statistical information should be automatically, routinely and systematically made available, with schedules published in advance and strictly observed. There should be a new statute to define a clear remit for the National Statistician and the Statistics Commission" (page 24).*

30. Improvements have been made with genuine attempts to regularise the situation; however again there is a need for ongoing monitoring to ensure these are sustained.

A New Approach to Briefing the Media

> *"We found that the lobby system is no longer working effectively for either the government or the media. We recommend that all major government media briefings should be on the record live on television and radio and with full transcripts available promptly online. Ministers should deliver announcements and briefings relevant to their department at the daily lobby briefings, which should also be televised, and respond to questions of the day on behalf of the government" (page 25).*

31. The original recommendations have not been implemented.

32. We believe that the current lobby system should be disbanded. Recent reforms to the lobby system have been useful, but have not addressed the central issue—which is the concept that there is some kind of "magic circle" of privileged journalists who are granted special access to the thinking of ministers. The current system encourages an unhealthy closeness between government and a small elite group of journalists, and the kind of anonymous briefing which exacerbates the cynicism with which the general public views the political system and politicians themselves. Briefings should be open and transmitted live along similar lines to White House

press conferences, where the spokesperson (a professional communicator) can choose to respond to questions. If individual ministers still wish to brief individual journalists off the record that is a matter for them—but the institutionalisation of mass anonymous briefings is anomalous.

Customer-driven Online Communication

> *"We found that, although significant resources are being devoted to government websites, the impact has been diluted by a lack of integration within departments and across government. We recommend that the central government website should be redesigned to meet the needs and perceptions of users, with individual departments only becoming "visible" when this makes sense to the users. Information on local public services should be prominent and easily found. There should be increased investment in websites to reflect the increasing importance of this method of communication" (page 26).*

33. Significant progress has been made and on the whole some government websites have become an effective tool to engage and inform stakeholders and the public. Directgov and Business Link are good examples of single points of access to government information and services for individuals and businesses.

A Reappraisal of the Relationship between Politicians and the Media

> *"We found a three-way breakdown of trust between politicians, the media and the general public. We recommend that politicians and the media should consider the extent to which their behaviour might support or undermine the objective of these recommendations—to help restore public trust in legitimate government communication" (page 26).*

34. Public relations should be interactive and not simply involve one-way communication. There is a need to establish a critical relationship of healthy scepticism between politicians and the media as well as between journalists and PR practitioners.

35. It may well be the case that public respect for politicians and journalists is at a low ebb. However, we are not convinced that it is permanently at an historically low ebb—such things tend to be cyclical as the public become disillusioned with governments over time. And the general public is more highly resistant to the urgings—and opinions—of newspapers than some journalists and editors would like to think. For hard news they rely on radio/TV (older generation) and online (younger generation). Scrapping closed lobby briefings might however go some way towards restoring public trust in politicians and the media, if the Committee believe that this is more than a cyclical and temporary issue.

18 September 2008

Memorandum by Professor Anne Gregory

Additional Information

I submitted evidence to the original Phillis Review in 2003.

I was seconded to and led the Cabinet Office Project Group which developed Evolve—the Government Communicator's Capability Framework in 2004–05.

I served on the Project Management Board, set up and Chaired by the Permanent Secretary Government Communications to oversee the development of Engage, the Government's Strategic Communications Planning methodology from 2005–08.

I now train Government Communicators in Strategic Communications Planning, Stakeholder Engagement and Leadership.

Evidence

As you can see from the above, I have been heavily involved in developing the framework for improving the capabilities of government communicators and in overseeing the development of the strategic communications planning approach for all Government Departments. I also train Government Communicators on a regular basis, so I have a deep insight into how communications in approached and implemented within Government.

IN MY JUDGEMENT

1. The appointment of a Permanent Secretary was a positive and necessary step and has helped to assert the neutrality of the Civil Servants role. It has also ensured that communications has been recognised as a strategic asset and activity within government requiring representation at the highest level. This appointment should be retained. The formation of the GCN has improved access to training and support for departments which has improved capability.

2. There has been a significant improvement in the structure of communications within Departments and it is clear that in a number (especially the outward-facing and delivery departments) it is being re-positioned and resourced as an important function with an increasing number of Communications Directors taking on more senior roles. However, the picture is patchy, there are still a number of departments that do not position and resource communications appropriately neither do they appreciate the contribution that communications can make.

3. Likewise, there has been a notable improvement in communications practice across Government Departments: practitioners are more skilled and more responsive. However, the picture in not uniform. While there are many instances of departments displaying consistently good practice, there are still some departments that do not.

4. There has been a re-balancing of the communications portfolio within government to a certain extent. Communicators are now using a broader raft of communications channels and techniques, including direct contact with the public. However, it is very clear to me that there is still a Ministerial obsession with the media and I have no doubt that this skews this balance. The focus is still "telling" the public rather than engaging with them.

5. From my observations I believe that pressure is still exerted on Civil Servant Communicators to "spin" stories and that comes from personal Ministerial agendas.

6. There is still much room for improving regional communications to connect local people to national agenda issues. Some regional consultations have been good (for example those on health and pensions), but these are the exceptions rather than the rule. Generally communications are initiated, driven and controlled by the Centre.

7. There is now greater consistency in training with the GCN playing a key role here. Indeed, this is an area than deserves positive recognition and indeed is being used internationally as a model of good practice.

8. I continue to have some concerns with some of the principles behind the Government's Strategic Communications Planning methodology which I have voiced from the beginning. It is based very much on a traditional marketing, customer exchange model aimed at "driving customer behaviours" to quote the oft used phrase. There are quite profound issues surrounding the notion of informed consent within a democracy here. The engagement with the public espoused in the model is to gain "customer insight" which is then used not only to inform policy (which Phillis proposed, but in reality appears to do only rarely) but to lever behaviour to gain public acceptance of policy. In other words, the model is instrumental—aimed traditionally at driving purchasing behaviour. While there is much to commend this model it has to be used with care and moderated for the democratic context. I have yet to hear a proper debate or recognition of this issue. Without a recognition of its importance, the principles of Phillis will not be achieved.

9. There appears to be closer co-operation and co ordination of communications between departments, for example the recent foot and mouth outbreak was handled well.

10. Overall I agree that the capability of communicators and the communications systems now in place have helped to move government communications towards the position recommended by Phillis. However, in summary I still have concerns about a number of areas:

- the philosophy underpinning the Government's preferred communications model;
- the persistent emphasis by Ministers on traditional media;
- the London-centric concentration of Communications expertise and resources;
- the fact that some departments appear not to position and resource communications at an appropriately high level; and
- the patchiness of good practice,

5 September 2008

Memorandum by Mr William Horsley

Journalist and broadcaster, Chairman of the Association of European Journalists (UK) since 2001 and former BBC News correspondent (to 2007). My comments draw on some 25 years' experience as a BBC foreign affairs correspondent, including 17 years of reporting closely from and about Europe, from 1991–2007. I worked for BBC TV and Radio as the BBC's Germany Correspondent from 1991–97, and then from 1997–2007 as BBC European Affairs correspondent working out of London, writing regularly for BBC News Online and presenting the World TV and News 24 magazine programme *Europe Direct*.

(NB The Association of European Journalists is an independent, non-partisan group of professional journalists and media practitioners concerned broadly with European affairs. It holds regular members meetings in London with public figures and promotes media freedom and standards. The AEJ has branches in more than 20 European countries, and was this year granted Observer status on media policy issues with the Council of Europe, the main watchdog for civil and media rights across Europe. I am also the AEJ's international Media Freedom Representative, and edited and co-wrote the two Surveys of Media Freedom in Europe published by the AEJ over the past year. They are available on www.aej-uk.org.)

1. This Submission

I am submitting these comments in response to your Call for Evidence, addressed to me by letter in July. It is an individual submission, but I include a few brief additional comments, with their permission, from two colleagues who have taken part in AEJ events.

2. Barriers to Openness: A Critical Assessment

I applaud the principles and main reforms proposed in the Phillis Report of 2004, but assess the implementation of the recommendations as inadequate in key respects. The government still tends to cling to a culture of secrecy, based on restricted and carefully rationed media access to information about policies. It is a self-defeating approach which also negates some good efforts to implement Phillis—for example by using government websites, e-mail shots and interactive services.

3. The "three-way breakdown of trust" among politicians, media and the public which Sir Robert Phillis and his team identified can not be said to have improved since 2004. On the contrary, a growing disconnect is apparent between the government's major declarations of purpose, and its assessments of life in Britain, and the realities and concerns in the mind of the British public. Entrenched, old-fashioned practices and attitudes of secrecy on the part of government ministers and officials represent a structural barrier to the dialogue the government says it wants. Importantly, the task of government communicators has been made harder, and sometimes perhaps impossible, by an obvious and much debated lack of political coherence in the government's presentation of its strategic priorities and policies, on issues ranging from taxation to energy policy. As a result the public largely feels excluded, not consulted, and has repeatedly shown in recent months that it feels baffled about the government's intentions and policies.

4. Public trust in the media has also declined further, from a rather low starting-point in 2004. The British public often sees the mainstream media as part of the same problem, of a privileged elite operating in a separate world, rubbing shoulders with those in power. Government and media are suspected of colluding in secret places and secret ways for their mutual advantage, despite the fierce attacks often traded between government and media (notably Tony Blair's "feral beasts" speech of 2007). A large part of the public is dissatisfied with the way the national media have reported and presented the changing picture of government activity. The remedy must lie in real government moves to ensure more openness and directness. One obvious step in that direction would be more live Internet broadcasts and transcripts of ministerial press conferences and other policy presentations.

5. The UK's mainstream media have themselves committed serious breaches of professional ethics, including phone-in scams, and they stand accused collectively of "dumbing-down" the coverage of serious issues in the nation's life in the pursuit of ratings, popularity and mindless glorifying of celebrity. Together, these failures on the part of government and media have led to popular disillusionment and alienation, which risks developing into a real sense of disenfranchisement among significant parts of the population.

6. How real is the government's commitment to more openness? Its recent policy decisions seem to cast doubt on it. The enactment of new anti-terrorism laws on pre-trial detention have disturbed much of public opinion as well as the media, and restrictions on court reporting of some security-related cases have placed extra barriers in the way of public understanding of matters of high public interest. Critics say the legislation not only only removes age-old freedoms but also hampers the media's freedom to inquire and report potential

abuses of executive power. Journalists including Shiv Malik have also faced new pressures, under threats of prosecution, to reveal their confidential sources. The Freedom of Information Act has proved to be a valuable tool for countering Whitehall's culture of secrecy. But the government has done its best to stop the Act from being used successfully in crucial cases, such as the request for disclosure of the early drafts of the intelligence dossier on Iraq's WMD capabilities.

7. The heart of the matter is that government ministers and officials too often persist in treating information about government policies and decisions as privileged information, instead of public property. The recent attempts to de-politicise the government's communications work does appear to have largely succeeded. But the system of government communications has often failed to deliver coherent messages in the face of contradictory policy formulations, U-turns and administrative failings, including the loss of sensitive data about sections of the population, among numerous other unsettling issues for the public.

8. Omissions and Weaknesses in Presentation of Foreign Policy

The Foreign Office has some great strengths in terms of press relations. In particular, the quality of briefings and policy presentations by senior officials compares well with other UK departments (as some of your other commentators have observed). Still, the intended messages of British diplomacy are not getting through to the UK media or to the general public, largely because the means of delivery are too narrow and old-fashioned.

9. I see particular difficulties in the government's presentation of its policies on foreign affairs in fast-changing times. In recent years the parameters of British interests internationally have shifted dramatically, for example in Iraq but also, I would argue, across the board. Yet the government has failed to explain the changing political winds of the world to the population at large. It sets the prevailing tone of public debate, in which big issues like Iran's nuclear programme or Russia's political and economic bullying of its western neighbours have remained the preserve of very small foreign policy elite. The roaring success of new initiatives such as the Intelligence Squared debates in London, which allow the public to debate big international issues with influential public figures directly, is evidence of the hunger for ways of opening up the debate and de-mystifying issues of foreign affairs.

10. One of the most serious failures of government communications is thus that the public has not been alerted to new threats to British security and interests such as the re-emergence of Russia as an aggressive power, nor to the sweeping change brought about by the UK's steady incorporation into a continent-wide system of governance through the European Union. One might surmise that the Foreign Office feels it has its hands full with communicating and seeking public support for controversial policies in Iraq and Afghanistan, and the emergency of combatting terrorist threats. But the failure to flag up and explain other drastic changes in the landscape has left the public bemused, fearful and reluctant to believe the government's appeals and explanations when crises erupt.

11. The point applies to issues as divergent as Russia's illegal invasion and occupation of much of Georgia and the need for the EU's Lisbon Treaty. In both cases the Foreign Office appears caught on the back foot in terms of public opinion. It now has an uphill struggle in the face of a suspicious public to prove what is self-evident and accepted by every reputable international body—that Russia has acted in flagrant violation of international norms and laws by its actions in Georgia and the crisis represents a grave test for the whole international community. As for the Lisbon Treaty, British diplomacy achieved many of its goals in the conduct of negotiations, but in the febrile climate of the UK the government made little effort to sell the merits of the package, or to explain how it might be good for Britain.

12. Indeed British officials sometimes appear to discourage discussion on that rather important point. As an example, when I asked a very senior official in a public forum to say how the UK would be approaching the formulation of a common foreign policy with other European states under the new rules foreseen in the Lisbon Treaty my question was dismissed without an answer on the spurious grounds that it must be motivated by "euro-scepticism". Answers must be given if the public is to have any confidence.

13. The need for more Openness on European Policy

The government has failed to make a cogent case either to the national media or to the general public for its approach towards the UK's part in the European Union. This represents an extraordinary failure, considering that the progressive steps towards political integration of the UK with its EU partners, through a series of binding treaties, represents a very profound change in the UK's actual system of government, affecting both domestic and foreign affairs in far-reaching ways. The British media are often blamed for hostile or inadequate coverage of Europe, and the BBC acknowledged in a recent review that it was not telling the story clearly

enough. But I judge that the government's failure to even try to explain the often complex workings of the EU is the root cause of this disconnect.

14. In opinion polls British people describe themselves as among the least informed as well as the most hostile to the doings of the European Union.

15. Britain's independent room for manoevre in foreign policy has become very obviously constrained by the need to act in concert with its main European partners in areas where key national interests are involved, including the Middle East and Russia. Events in Iran, Iraq, Georgia and Russia have highlighted that constraint, especially since other European states have shown that they hold very different priorities and goals. Britain's uncertain role within Europe appears to be undermining the government's overall sense of purpose in foreign policy. This, combined with popular dissent over some policy areas, has made the presentation of foreign policy appear less convincing in the eyes of the public.

16. The UK's relationship with Europe appears to be the government's biggest blind spot. Supporters and opponents of the EU integration process disagree fiercely about the merits of setting up a more formal, legally-grounded and elaborate EU structure of governmental power by means of a new treaty among all EU member states. But both sides are broadly agreed that the latest version, the Lisbon Treaty, (the successor to the failed "EU Constitution") means that the UK and other national governments would cede very significant powers over both home and foreign policy-making to a collective EU decision-making system through "shared sovereignty". Yet the government has held fast to the argument that the treaty will not affect the fundamental relationship between the UK government and the EU. Michael Connarty, the Labour chair of the European Scrutiny Committee, seemed to make a mockery of the government's stance by stating that the EU's Lisbon Treaty would involve a "massive" transfer of powers from Westminster to EU institutions. My own knowledge of the process over many years tells me that Mr Connarty's assessment is correct.

17. In my evidence below I draw special attention to the government's perceived failure to be truthful about the significance of the EU's Lisbon Treaty. The dominant focus on domestic policy of this House of Lords Inquiry should not, I submit, be at the expense of grasping the high risk of an explosion of public disquiet or dissatisfaction over this issue. The media barrage against the government policies on Europe, including the ratification of the Lisbon Treaty, is an omen of what may follow. British officials and ministers would be well advised to take in the lesson from Ireland, where an aggressive campaign to blacken the name of all opponents of the Lisbon Treaty as "extremists" before this year's referendum backfired spectacularly. The Irish voted No by a large margin and in unexpectedly large numbers.

18. Legacy of the Past

Although this Inquiry is looking into what changes have occurred in the past four years it is important to establish that the Hutton Inquiry into the death of David Kelly has left a toxic legacy in terms of the government's record for trustworthiness, as well as trust in the BBC. It is enough to note that in opinion polls the British public believed by a clear margin that the government was more at fault than the BBC in the affair. The government's own probity has come sharply into question again recently over the decision on national security grounds to halt a Serious Fraud Office investigation into BAe System's arms contracts with Saudi Arabia, described as the biggest arms deal in the UK's history. Without taking this point any further, I want to note that public doubts about the well-aired allegations of corruption are bound to colour the ongoing efforts to improve government communications and re-build the three-way trust with the media and public.

19. Media Access

The promises set out in the Phillis Report about open media access to press conferences and briefings have not been fulfilled. That failure continues to damage the relations between government and media and the public's right to know about a range of policies and decisions. In earlier hearings to this Inquiry senior government officials responsible for press relations stated that press conferences and briefings should be open to "everyone", adding that action should be taken to correct the mistake if they were not. But in practice the daily on-the-record briefing by the prime minister's spokesman inside the Commons is limited to those journalists with a parliamentary pass, while the one held inside the Treasury is also limited because of rules governing access to the building. Similar rules limiting journalistic access apply in other ministries, at Number Ten and at the Foreign Office.

20. The restrictive policy needs to be changed, both to avoid favouritism and to serve the much wider range of media outlets now working to provide information and articles to new outlets, new media and the Internet. If the government accepts the Phillis recommendations, ministers should take responsibility for ensuring that press officers allow open access to press conferences, and wherever possible to background briefings as well.

Press officers often assume the authority to be gatekeepers for their seniors and political masters. That discretion may sometimes be necessary but it is often misused and should be curtailed or stopped.

21. The privileged circle of political correspondents for leading media covering the Prime Minister naturally enjoy special access to top government figures and sensitive information. But this inner circle also displays some of the weaknesses of any "closed shop" group, and there is a serious down side to the creation of such an exclusive group: when foreign leaders attend press conferences in London with the British prime minister and the right to ask questions is (as usual) granted to members of that tiny group, important international issues often go unmentioned or unquestioned. There is no space to pursue such points here, although I believe they are important and the current arrangements sometimes act as a barrier to understanding—and therefore also to the government's own goals.

22. The system of employing a civil servant, Mr Ellam, to speak on the record but not on camera is another important failure to deliver on the pledges of Phillis in 2004. Jon Devitt, who was political correspondent for BBC World TV and BBC World Service radio until May this year comments as follows: "By devising this system the government has constructed a new bureaucratic skin to protect itself from difficult questions. Mr Ellam, as a civil servant, only gives a few lines of official comment which he often repeats in answer to every question. It would obviously be better, as Phillis suggested, if these briefings were televised."

23. Jon Devitt observes, in tune with Nick Robinson's observations to the Inquiry, that the best arrangement is for the prime minister to have a powerful, authoritative figure as his spokesman, such as Bernard Ingham for Mrs Thatcher or Alistair Campbell for Tony Blair, because they can be properly interrogated by journalists. I personally agree with that.

24. The UK's Image Damaged by Media Policy at Summits

In a rare display of media shyness, UK government ministers have for some years refused to give press conferences when attending the regular quarterly European Union summits, usually held in Brussels. For some years they were the only national delegation to act in that way. Tony Blair began the practice, instead, of making short "doorstep"-style appearances at the VIP entrance, where leading British media representatives would gather by arrangement in a small group, excluding most other journalists covering the summits. This custom seems to have begun in about 2001 as a way for the prime minister to avoid the risk of persistent questioning by British political correspondents on awkward domestic issues in a venue where the PM wanted to stick to current business, or at least to European issues.

25. This practice is much resented by journalists from other parts of Europe and it appears after some years to be damaging to the image of Britain in indirect but perhaps important ways. Another sign of the UK government's lack of proper concern for its wider press responsibilities is the troublesome and long-drawn-out system of handling the accreditation of foreign correspondents who settle in London. I have been told by individual correspondents, such as a national TV correspondent of a fellow-EU state, of his annoyance at being humiliated by the unnecessarily curt and thoughtless treatment of UK officials.

It goes without saying that British media workers would regard such behaviour as quite unacceptable if meted out to them in a foreign country. However, I welcome the commitment of the Foreign Office to revive and refurbish the Foreign Press Association as a worthy venue for a range of press events in London.

26. Conclusions

Government leaders and ministers need to take active responsibility for effecting a major opening up of government to achieve a more open provision of information to the media as a whole. Press conferences should be made open to all bona fide journalists, within the limits of space. They should be televised on the Internet and made available as recordings as a matter of course. The prime minister and cabinet themselves set the tone for government communication and relations with the media.

27. Martyn Bond, a member of the AEJ and deputy director of the London Press Club, adds this recommendation: "The Phillis Report stresses the need for two-way traffic between journalists and the government's press operations to overcome the assumptions of "them and us". I would urge the adoption of the Phillis recommendation of short-term contracts for professionals who could work in government communications for a time as part of a career which would continue outside the civil service. This could involve an extensive scheme of internships at an early stage of journalists' and civil servants' careers.

28. "Further, formal training courses for civil servants and media employees should include comprehensive information about the other, including emphasis on the importance of mutual understanding, both for efficient government and for the media to fulfill its role of accurately informing the public. In particular, more training would be helpful to ensure journalists' clear knowledge of relevant parts of the law."

29. Britain is fortunate in having robust and diverse national media. The open questioning of those in power, especially as carried out among others by respected national institutions like the BBC and leading newspapers, is essential to Britain's democratic life. But the country's laws governing the media have grown unreasonably restrictive and should be reviewed in order for a more open regime of government communications to work. A cultural revolution in favour of openness is overdue.

15 September 2008

Memorandum by Mr Nicholas Jones

Written evidence from Nicholas Jones, political journalist and author. Council member of the Campaign for Press and Broadcasting Freedom. Contributor to www.spinwatch.org.uk Archive of articles and speeches: www.nicholasjones.org.uk (In 2003 Jones gave evidence to the Phillis Review team and participated in its seminars)

There could hardly be a more opportune moment to consider an overhaul of the government communications system and to chart a new sense of direction for civil servants working in the information service. The forthcoming general election and the installation of a new administration will provide an ideal opportunity for a fresh start. What is needed is a change of culture and a new presumption that the flow of information from the state to the media should be de-politicised and that all news providers outlets should have equal access.

The practice of trailing government announcements in advance—almost invariably on an off-the-record basis—has now become institutionalised within Whitehall departments. To all intents and purposes it has become the state-sanctioned leaking of official information and it is the widespread distribution of confidential data on an un-attributable basis which has done so much to weaken the neutrality of civil service information officers and undermine the credibility of what is being said by the government of the day.

As a first step Downing Street lobby briefings should be given in public by an upfront spokesperson and the proceedings should be available for live broadcast on television, radio and via the internet. A lead has to be given from the top: if daily briefings on behalf of the Prime Minister were given on the record, by a publicly-identified spokesperson, it would set a new standard for attribution for the rest of the government.

The Phillis review recommended that lobby briefings should be "on the record, live on television and radio and with full transcripts available promptly on line." (Phillis Review 2004). Despite its acceptance of the Phillis recommendations, the government made only a half-hearted attempt to persuade lobby correspondents to accept on-camera briefings and it was no surprise that the lobby voted to maintain the *status quo*, anxious to defend at all cost the un-attributable and anonymous briefings which have become the lifeblood of modern political journalism.

Nonetheless if the leading Downing Street spokesperson had the necessary confidence and authority to speak publicly, that individual would inevitably be accountable for what was being said on behalf of the government and if there was a greater degree of accountability it would help curb the uncontrolled activities of the much-enlarged cadre of special advisers. It is these political aides who are responsible for many of the anonymous briefings which in recent years have caused so much mischief for ministers and civil servants and undermined the credibility of official information.

On-camera briefings would introduce a sense of discipline and reinforce the repeated recommendations by the Civil Service Commissioners that special advisers should be required to speak on the record. Greater certainty about the government line would also assist departments and agencies. Senior civil servants in the UK, like their counterparts in the USA, would then come to realise that if needs be, the practice of speaking on the record does have many advantages.

Political correspondents prefer to be briefed un-attributably because it gives them a greater degree of journalistic licence. They maintain that being able to get information from politicians and officials on an off-the-record basis results in more exposure and serves the public interest. But the growth in the number of anonymous sources in Whitehall and Westminster—and the freedom this has given journalists to embellish and even fabricate stories—has become a cancer, eating away at the authority of the government of the day and eroding trust in the political system.

The rapid expansion in online journalism and the growing impact of alternative news providers has opened up an opportunity for the Whitehall machine to re-think its strategy. Significant political stories are now being researched and delivered by journalists outside the Westminster lobby system. Websites, bloggers and reporters using the Freedom of Information Act are increasingly challenging—and beating—the established political correspondents and the government of should encourage this trend, not least because of the greater openness of on-line journalism.

The aim of the state should be to be even handed in the supply of information and in view of the immediacy and commendable transparency of most on-line journalism, there is nothing to be gained by perpetuating the divisive practice of continuing to give exclusive access and information to favoured political journalists.

Trading exclusive stories with selected national newspapers, television and radio programmes is seen by the administration as the only way to influence the news agenda and gain favourable publicity. But this practice has always been divisive and the House of Lords Communications Committee could give a lead by reviewing the evidence since the Phillis Review and by recognising that a new approach is needed.

Perhaps the clearest exposition of the mentality which persists across Whitehall was given by Tony Blair's former director of communications, Alastair Campbell. In his diaries, *The Blair Years* (2007), Campbell said that his policy when it came to the news media was to "divide and rule". (see 31 January, 200, page 441).

Campbell's first act on becoming Blair's Downing Street press secretary was to rewrite the rule book for government press officers to ensure that the Whitehall publicity machine raised "its game". (See report of Mountfield working group, November 1997). *Press Office Best Practice* was revised and civil servants were instructed to "grab the agenda" by promoting government announcements by means of a selective "ring round" of newsrooms in order to start "trailing the announcement during the previous weekend".

Campbell's edict of "divide and rule" became the norm and is deeply ingrained in civil service psyche as illustrated by the text of confidential government media plans. (See *Trading Information: Leaks, Lies and Tip-Offs* by Nicholas Jones, Politico's 2006)

For example, the lead up to the announcement that the government had purchased the London Heart Hospital for £27.5 million in 2001 was a textbook example from the pages of *Press Office Best Practice*. A leaked copy of the Department of Health's media plan indicated the importance of advance, off-the-record briefings when implementing a media policy of "divide and rule":

"We are trailing the story with David Charter at *The Times*. In addition we will brief the *Today* programme . . . Once the story breaks in *The Times* this evening, the duty press officer will ring round all broadcasters and picture desks to let them know of the morning photo call . . . A press notice will be issued at 9.30 am (Department of Health media plan, 8 August, 2001)

The unedifying spectacle of the state competing in the media market place—rather than serving the public interest by supplying all media outlets with information at the same time—reached its nadir in April 2007 when two members of a Royal Navy crew captured by the Iranians were allowed (encouraged?) to sell their stories exclusively to the national press (Faye Turney was paid £100,000 by the *Sun* and Arthur Batchelor received £20,000 from the *Daily Mirror*).

There was a public outcry over what happened and considerable criticism of the failure of the Ministry of Defence to deal fairly with the news media as a whole by failing to present the released crew members at a press conference open to all news outlets.

Tony Hall, who conducted an inquiry for the government, found there had been a "collective failure of judgement" over the affair and officials within the department "simply didn't understand how it had been allowed to happen".

Perhaps Hall should have done more to acquaint himself with media practice within Whitehall and he would have understood that the strategy of supplying exclusives to two of the biggest-selling popular newspapers—*Sun* and *Daily Mirror*—is precisely the kind of strategy which has become the norm within the civil service.

Sir Richard Dannatt, Chief of the General Staff, was so appalled by what had happened that he made sure that all media outlets were dealt with even handedly when Prince Harry served in Afghanistan. A news black was arranged with the Society of Editors and equal access for newspapers, television and radio was assured when the story finally broke in February 2008.

Another illustration of what can be achieved is the success of the Crown Prosecution Service in providing a legal spokesperson to give on camera reaction at the end of controversial court cases. Sir Ken MacDonald, the DPP, deserves credit for this initiative. At the conclusion of trials which have a significant public interest, the Crown Prosecution Service provides a spokesperson outside the court. Here we have a demonstration of the openness which can be achieved.

I have long argued that journalists are unlikely to put their own house in order and it is the state which should make the first move. I do hope Lord Fowler, chairman of the Lords Communication Committee, will look at the transcripts of the Westminster Media Forum which he chaired earlier this summer (1 July 2008).

One of the contributors to the discussion was David Hill, who succeeded Alastair Campbell as Blair's director of communications. Hill told the forum he believed the twice-daily Downing Street briefings should be televised. This would open up the lobby system to wider scrutiny and force political correspondents to ask their questions in public. Hill believed the lobby briefings as presently constituted were counter productive and if they were on camera he hoped that whenever possible a senior minister would attend to answer questions.

In conclusion I would argue televised briefings would not be a mere cosmetic but could become an important constitutional safeguard. American news services keep their recordings of White House briefings and if a story suddenly changes, or there are suggestions subsequently of a cover-up, radio and television stations can replay the original answers and draw attention to any alterations or discrepancies in the official guidance.

Televised extracts from White House briefings during the lengthy proceedings involving President Clinton and Monica Lewinsky became part of the montage of material which was shown as pressure mounted for impeachment. Mike McCurry, Clinton's press secretary, resigned in October 1998 in protest at the way he felt he had been used unfairly to perpetuate a deception about Clinton's sexual relations.

My point is that televised briefings would not only help the government of the day by allowing ministers to get off the back foot and explain their policies but would also herald a new era in openness which might help restore trust in the process of government and also make life harder for the journalists who make it up. There are far fewer hiding places for on-line journalists. They can get challenged within an instant and do have to adjust and correct their reports. Not only might there be more transparency in government, but also a greater level of attribution by reporters and less reliance on the use of anonymous sources.

18 August 2008

Letter from the Rt Hon Francis Maude, MP

Inquiry into Government Communications

I am responding to your invitation to submit evidence to the Select Committee's inquiry into Government Communications on behalf of the Conservative Party. We very much welcome the recommendations of the Philips Review. Rather than repeating its content, I have sought to focus on additional points of note.

Reversing the Politicisation of the Civil Service

1. Any review of government communications needs to be taken in the broader context of the need to undo the politicisation of the Civil Service that has occurred under the current administration.

2. Under Labour, the number and cost of special advisers has trebled from the 38 that existed in 1996–97.[1] This uplift has come about through an increase in special advisers who have a communications/press role, rather than policy/research advice. A series of controversial incidents involving special advisers (eg Jo Moore, Charlie Whelan, Dan Corry, Alastair Campbell) has exposed how the changes in their number and role has had a seriously adverse influence on the workings of government, especially in the context of communications.

3. We believe there should be a statutory cap on the number of special advisers, as part of a wider Civil Service Act to strengthen the independence of the Civil Service. Special advisers have a key role to play as advisers to Ministers, but their role should be more tightly defined.

4. We should recognise the role that political party headquarters have to play in enabling Ministers to make partisan responses to political events. Rather than undermining the Civil Service machine, it helps protect its impartiality.

[1] *Hansard*, 25 November 1997, col 472W.

Greater discipline in use of government advertising

5. Central Office of Information spending on public relations, marketing and advertising now costs £391 million a year, more than three times the rate that Labour inherited.[2]

COI Spending	*£*
1997–98	£111 million
1998–99	£173 million
1999–2000	£200 million
2000–01	£295 million
2001–02	£273 million
2002–03	£267 million
2003–04	£317 million
2004–05	£343 million
2005–06	£322 million
2006–07	£338 million
2007–08	£391 million

6. Despite the Government supposedly having to make "Gershon" efficiency savings, the first year of the current Prime Minister has coincided with a 16% rise in the cost of Government advertising, marketing and publicity.

7. Government advertising has also attracted particular controversy this year, when the Home Office abused the marketing funds by funding newspapers advertisements on police during the local elections "purdah" period, mirroring the Labour Party's own campaigning. There has also been an historic trend of COI advertising strangely rising just before an expected general election.

8. At a time when the public finances are under so much pressure, it is clear that greater discipline is needed in the use of government advertising. Advertising should focus on areas when there is a clear public benefit (such as safety or public health campaigns), and the letter and spirit of purdah guidance should be more strictly adhered to.

Opinion polling is no substitute for democratic accountability

9. The latest COI annual report justifies the growing expenditure as necessary to engage the public: "Consulting the public has always been key to intelligent government, and the Prime Minister is hugely in favour of engaging with the citizen".[3]

10. Yet the Department for Communities and Local Government's latest citizenship survey has found that only 38% of people in England agreed that they could influence decisions affecting their local area, and just 20% on decisions affecting Great Britain. This is down from 44% and 25% respectively in 2001.[4] The increase in government advertising spend has coincided with greater political disillusionment, not greater engagement.

11. In this context, the Government's planned expansion in the use of citizens' juries—glorified focus groups and opinion polling—should be questioned. For example, in the last 24 months, £33 million of taxpayers' money has been spent on Ipsos-MORI polling alone by central government.[5] The Government's plans for new local government Place Surveys will entail a further £55 million spend on opinion polling.[6]

12. Throwing millions at such pollsters will do nothing to address political detachment by the electorate. Public engagement is better promoted through responsive local government, a vibrant Parliamentary democracy, greater use of direct democracy and improved Ministerial accountability.

More efficient Whitehall press operation

13. Twice a year, the Central Office of Information publishes an internal directory listing information and press officers in government departments and public bodies (called the "White Book", previously the "Information and Press Office directory"). I would recommend that the Select Committee may wish to examine this publication to get a detailed picture of the Whitehall press operation.

[5] Answers to a series of Parliamentary Questions, March—May 2008.
[6] DCLG, *The New Place Survey: Consultation*, December 2007.

14. Analysis of the July 2006 and September 2007 editions of the White Book illustrates the scope and size of the Whitehall communications operation under both the current and previous Prime Ministers.[7]

15. Despite the Gershon plans to reduce the administration costs and the head count of Whitehall, the total number of press and communications staff has not fallen. Comparing like with like, there were 3,252 in 2007 compared to 3,238 staff in 2006.

Communications staff in Whitehall and quangos, according to directory	*2006*	*2007*
Total	3,238	3,252
Communications staff in central Whitehall departments	*2006*	*2007*
Central Office of Information (including Media Monitoring Unit)	249	243
Ministry of Defence	229	229
Department for Work and Pensions	181	180
Home Office	145	157
Department of Health	117	102
Department for Transport (including certain agencies)	103	95
Department for Communities and Local Government (including 13 staff from Government Offices for Regions)	82	90
Department for Environment, Food and Rural Affairs	107	87
Northern Ireland Executive, NI Assembly and NI Information Service	67	85
Scottish Executive and Scottish Parliament	72	77
Department for Education and Skills	75	–
Department for Children, Schools and Families	–	71
Department for Business, Enterprise and Regulatory Reform	–	70
Ministry of Justice	–	62
Department of Trade and Industry	62	–
Foreign and Commonwealth Office	42	53
Department for Constitutional Affairs	51	–
Cabinet Office (including "Government Communication" group)	54	52
Department for International Development	27	48
Welsh Assembly Government	80	42
HM Treasury	29	34
Communications staff in central Whitehall departments	*2006*	*2007*
Department for Culture, Media and Sport	27	26
Prime Minister's Press Office	24	23
Department for Innovation, Universities and Skills	–	9
Attorney General's Office	3	3
Wales Office	3	3
Office of the Deputy Prime Minister	3	–
Scotland Office	2	2
Total	1,834	1,843

16. I can provide a similar chart for Whitehall quangos on request, although the White Book understates the total number, as for many quangos only the most senior staff are listed.

17. There has clearly been a significant increase in communications staffing under the Labour administration, which cannot be explained away purely due to the "demands of the 24/7 media". As an illustration, the Home Office—always a busy brief—had 19 press officers in 1996–97.[8] Today, it has a total of 157 communications staff, despite the transfer of responsibilities to the Ministry of Justice (who have a further 62). The Home Office includes 50 in the press office, a director of communications, 23 staff in marketing communications, five in communication strategy, 49 in corporate communications, three PR staff in science posts, and a further 26 communications staff in the Border and Immigration Agency division.

18. The sheer number of staff in some departments raises questions over their efficiency and purpose. The Government has given communications staff a myriad of different titles, such as "strategic media planner", "strategic communication team leader", "communications manager: change agenda", "communications development manager", "integrated communications officer", "face to face communications", "internal

[7] Obtained via *Hansard*, 17 October 2007, col 1133W and *Hansard*, 6 July 2006, col 1359W.
[8] Select Committee on Public Administration, *The Government Information and Communication Service*, HC 770, July 1998, Appendix 11.

strategy communications adviser", "regional image PR specialist adviser", "communications standards senior executive officer" and "marcomms team leader".

19. As an example, the Department of Work and Pensions has in its 180-strong communications department: a Director of Communications, a Head of Strategy & Planning, a Head of Strategic Communications, a Head of Communication Operations, a Head of Internal Communications, a Head of Network Services, a Head of Communications (Child Support Agency), a Head of Marketing (Job Centre Plus), a Head of Communications (Job Centre Plus), a Head of Customer Relations, and even a "Head of Customer Acquisition" for its benefits team.

20. The following conclusions can be drawn:

(a) Some government departments have an excessive number of communications staff that bears no relation to their effectiveness. The smaller government department press offices tend to be more effective, by avoiding duplication of functions, discouraging the creation of work for its own sake and ensuring a tighter co-ordination of media response.

(b) The number of quangos with their own communications staff is wasteful. In particular, more executive agencies could have their communications handled in-house by their parent department; this is already a practice of the Department for Transport, for example.

(c) The White Book should list the communications staff in full across all non-departmental public bodies, to allow greater scrutiny of the true number across Whitehall.

(d) There is significant Whitehall expenditure on external public relations agencies.[9] Whilst there may be cases for out-sourcing, such expenditure cannot be justified in addition to having massive in-house communications operations.

Changing the communication of information in a digital age

21. The internet is changing traditional business models, boundaries of authority and concepts of government control. In a digital age, access to information and the ability to communicate it should no longer be controlled by a few. Central to any strategy of government communications should be the changing the relationship between citizen and state in access to information.

22. Shadow Chancellor, George Osborne, has outlined proposals to allow the public to see how and where their money is being spent, by placing financial details of government expenditure online. Such an approach is already being implemented by the US federal government, in a programme informally termed "googling your tax dollars".

23. More local government information should be made available to the public, in formats that allow innovative and creative uses. We have proposed that there should be a standardised formats[10] for local authorities to publish information online, which can then be collected and "mashed up" by the public.

24. Uses could include creating the town hall equivalent of "theyworkforyou", Bebo widgets for information on youth services, Google Maps telling you what day your rubbish is collected or what planning applications are being submitted, or allowing a common recruitment website for local government jobs. This would be accompanied by relaxing controls which force councils to pay to publish little-read statutory notices in local papers. The net result will be to reduce local government costs, by allowing them to spend less money on advertising, while increasing accessibility, communication and accountability.

Broadcasting the decision-making process

25. Rather than paying for advertising to communicate "policies", greater efforts should be made to give the public direct access to politicians and the decision-making process. This does not have to incur great expense.

26. The frequency of televised debates in US politics helps engage the public and hold politicians to account. There should be an annual set-piece televised debate between the Prime Minister and the Leader of the Opposition, and individually, between the Home Secretary, Foreign Secretary and Chancellor and their opposite numbers.

[9] This is an area that my Shadow team is currently investigating in more detail, but I note, as examples, the DCLG spending £1.2 million in external public relations in the last 24 months (*Hansard*, 19 October 2007, col 1326W), the DfT and agencies has spent £5.5 million in the last 72 months (*Hansard*, 24 April 2008, col 2210W).

[10] The technical term is XML Schema—common standards to share information in XML formats, which can then be syndicated, and the data incorporated into third-party applications.

27. The infrequent televised questioning of the Prime Minister by the core Select Committee chairmen should be extended. The frequency should be increased, and new formats introduced—such as the questioning of the Prime Minister by opposition leaders in a Committee format.

28. More and more key decisions about public policy are taken by those who are appointed by Ministers without reference to Parliament. These quango chiefs are "operationally independent" and absent from proper political accountability. Select Committees should have the right to approve or reject major public appointments (and re-appointments), including the chairmen of executive agencies and non-departmental public bodies. Televised confirmation hearings should hold to account the heads of quangos who make decisions that affect our lives.

Conclusion

Any changes to government communications must be in the context of giving people more power and making politics more accountable. The current top-down approach involving a massive expansion of communication by the state, which has not succeeded in influencing public opinion, is no longer sustainable.

I am happy to provide more detailed information on any issue on request.

15 September 2008

Letter and memorandum by Sir Christopher Meyer

Thank you for your letter of 15 July, inviting me to give evidence to the Lords Select Committee on Communications.

I previously sent a written submission to the Commons Select Committee on Public Administration on 25 March 2004, in which I raised a number of objections to the Phillis Review's recommendations. I see no reason to change my views and I am therefore re-submitting my brief paper. I am sure, given his ability and energy, Mr Howell James, as Permanent Secretary for Government Communications has made significant improvements to the government communications machinery. But, seen from the outside, there are no discernible changes for the better in the quality or flow of public information.

The views expressed are personal and individual.

1. I disagree with most of the recommendations in this report.

2. It begins with some large assumptions about an alleged three-way breakdown in trust between politicians, media and the public; and the consequences of this for public interest and engagement in the political process.

3. These assumptions are open to challenge. Even if true, the remedies proposed in the report—to the "conduct, process and style" of government communications—are not the answer.

4. The report's recommendations are based on several misconceptions.

Briefing the Media

5. The report calls for the replacement of the lobby system by on-the-record briefings, broadcast live on TV and radio and often given by Ministers.

6. It is unlikely that these briefings will normally be interesting enough to justify the cost to television and radio networks or live or recorded broadcasting. In the United States, television cameras are present at the daily White House, State and Defence Department briefings. But very little, if any, footage survives to the main news bulletins.

7. On-the-record briefings, either by ministers or civil servants, are imperfect vehicles for communicating with the public. Precisely because they are on-the-record, spokesmen will tend to put caution before candour. "Lines to take" and blandness will likely predominate. Government spokesmen will not wish to go into all the background and details of a policy, unless they can do a large part of this on an unattributable basis.

8. The USA is again instructive. A vast panoply of televised, broadcast, and on-the-record briefings has done nothing to eliminate an equally vast market in unattributable briefings. (There is a major controversy in the US today whether, in return for access to senior members of the Administration, speaking unattributably, US media reflected too uncritically the views of the Administration on Iraq.)

9. In other words, call it "lobby" or what you like, there will always be a market in the worlds of policy and politics for information conveyed in ways other than on-the-record. Indeed, without this market the public will never be fully informed. The Phillis Report does not demonstrate why its recommendation for a "new

approach to briefing the media" will be an improvement on the current system: a robust combination of press conferences, ministerial speeches, parliamentary debates, lobby briefings and interrogation on the *Today* programme.

Government Communications

10. The report unrealistically tries to dissolve the sharp distinction between media handling and government communications more widely. "Integrated communications" has a nice ring to it, but it will not work. The requirements of media handling, and the skills needed to meet those requirements, are highly specialised. They are quite different from those needed to maintain a "continuous dialogue with all interested parties", with the focus of attention on the general public.

11. Indeed, in its emphasis on "unmediated" government communication with the public, the report underlines by default the gulf between press handling and other forms of communication. This undermines the credibility of the report's major recommendation: "Strong Central Communications Structure".

A Central Communications Structure

12. This is a flawed recommendation. The best that can be said about it is that, as immediate concerns about the relationship between press, politics and the public fade, as they will, the Permanent Secretary, Government Communications, will be left running a souped-up version of the GICS, and not much more.

13. The main flaws are:

(i) As mentioned above, the subsuming of media-handling skills into a "wider definition of communications professionals". This is to mix chalk and cheese.

(ii) The unleashing of a permanent turf war between the new Permanent Secretary and Whitehall Departments, including No. 10, who will consider that they know better then he/she.

(iii) The tension between a "strong central communications structure" and the need to ensure that Departments closely integrate "policy development, service delivery and communications."

Centre versus Departments

14. The report rightly argues that presentation issues should be taken into account at an early stage of policy development. The new Permanent Secretary, Government Communications, may be able to help this process at the margins in individual departments; but it will not happen effectively unless generated from within departments, with leadership coming from the departmental ministers and permanent secretary.

15. It will not happen either unless those who are responsible for media and communications are drawn from within the department's mainstream. The creation of a separate cadre—"a new and authoritative communications service"—members of which are parachuted into individual departments, will militate precisely against the formation of expertise within the department and the acceptance that working with the press and on communications is part of a civil servant's normal career structure.

16. The emphasis should, therefore, be on decentralisation as far as the inculcation of the right culture and expertise around Whitehall is concerned. It will always be those closest to the Prime Minister, whether civil servant or political appointee, who play the dominant role in ensuring coordination across Whitehall. That is how it should be.

Policy and Politics

17. This is the great intractable. The report makes a good stab at clarifying the dividing line between civil servant and political appointee. There is no ideal formula and much depends on personalities. I left the No. 10 press office in 1996 firmly of the view that, so as to give the whole picture, the Prime Minister's spokesman must be able to brief on policy and politics; and the job could no longer be done by a civil servant.

18. For what its worth, Americans are amazed that this is a job given to civil servants.

Conlusion

19. The worry about this report—and the remit given the Review—is that it has mistaken a bad patch in government relations with the media and public opinion for a structural breakdown, which threatens the democratic process and calls for a "radical" remedy. I believe this to be false. This is not to say that government and media should not raise their standards; nor that there is no room for improvement in the way departments integrate issues of public presentation into policy making. But a new Permanent Secretary, Government Communications, and the structure he/she is to supervise, will prove cumbersome and ineffectual.

22 July 2008

Memorandum by the Newspaper Society

1. Thank you for inviting the Newspaper Society to submit evidence to the Committee.

2. The industry delivers trusted and relevant news, information and advertising to over 40 million people a week across its print, online and broadcast channels. These now include around 1,300 daily and weekly newspapers, 1,100 websites, 750 magazines, 36 radio stations and two TV stations. Regional newspaper companies have evolved into regional media companies developing powerful combinations of print and digital services to "layer" their local markets, extend their audience reach and deliver ever greater advertiser response.

3. The Prime Minister wrote this summer that: "Local newspapers are right at the heart of Britain's local communities, examining the issues which matter, seeking out local people's views, and representing their interests. That is why the readers of local newspapers see them as such honest, responsible and accurate sources of news."

4. Rob Haslam, the outgoing GNN board director, COI, stated last year: "I seem to have spent half my working life persuading my Whitehall colleagues about the importance of working with the regional media, which researchers have regularly found to be more trusted, valued and widely read than the nationals.

The regionals have raised their game with the incorporation of ever more blogs, audio and video feeds and citizen journalism on their websites. During the recent flooding in Gloucestershire, local papers *The Citizen* and *Gloucester Echo* provided constant updates on their joint website with advice on things like where to buy supplies, get access to clean water and which streets were closed. Relevance and immediacy have never been more important factors to public sector communicators, and it is here where local media hold the trump card."

5. It is important that the Government Communications Service continues to appreciate the strengths of the regional media and values the contribution that it can make in communicating and engaging with the public at local and regional level. One of the main recommendations of the Phillis Review was greater emphasis on regional communications.

6. The NS briefs the COI and Government departments on the hard evidence, statistics and abundant research which support the Prime Minister's statement. The NS's oral and written evidence to the Committee's previous inquiries has summarized some of those findings. We would be happy to provide more detailed information if the Committee would find it helpful for the purposes of this enquiry.

7. Nonetheless, we have found it increasingly necessary to remind politicians, government departments and their communications services of the importance and effectiveness of the independent local and regional media's editorial and advertising content. Various policy papers suggest that government and public bodies should develop and rely upon their own communications channels rather than the independent media. There is seldom any evidence to support this assertion, other than a suggestion of possible costs savings. Little consideration is given to the consequences for democratic debate—and that "regional newspapers are the backbone of democracy" as the Lord Chancellor recently stated in Parliament.

8. The websites, broadband services and in-house publications produced by central government, local government and other public bodies are not as effective as the local media in attracting, communicating and engaging with the public for advertising or editorial purposes.

9. Governments should not forget the reason why Parliament so often specified publication in the local press—this was and is the most effective way of alerting the local people concerned. Regional newspapers are considered by British people to be the most trusted and reliable of all media.

10. If a public notice has to be published in the independent local newspaper, then the public authority cannot try to avoid public debate of controversial proposals by tucking it away in a seldom consulted, poorly signposted obscure corner of its own website.

11. If wider discretion is given as to how information should be publicized to those most likely to be affected by it, then the public authority should be guided to the local newspaper companies as the foremost providers of multi-media means of communicating with the local community and its individual members. They can

provide any level of coverage or communication—from regional coverage of their daily newspapers, their comprehensive websites and associated services, broadcast and broadband services, communities whether interest based or geographic to the postcode coverage or direct individual communication through the audience for their hyper local newspapers and websites or individual person reached by mobile services. Regional and local media companies are happy to work with public bodies to help them improve their engagement with their local communities.

12. It is also important that any encouragement of the development of "Customer-driven online communication" does not mean that central or local government bodies' websites should become the sole repositories of information about themselves and their activities. This would only reduce public information and public oversight.

13. Public bodies' perceived attitude towards implementation of freedom of information legislation, predicating on finding an exception and withholding information, rather than a presumption of disclosure, as originally intended, illustrates only too well why central and local government's own publications cannot be allowed to become the carefully controlled, sole source of information about their activities.

14. The NS has raised elsewhere the wider dangers of policy makers' assumptions that local and regional news and information should become increasingly the preserve of state funded, state owned media.

15. The Phillis Review stressed the importance of regional and local communication. The role of the independent local media, and its editorial and advertising strengths, and the assistance which it could give must not be overlooked by Government when considering how it intends to implement its policies of "engaging local communities" (DCLG White papers and proposals to review planning system local government publicity codes), or involving the local community (eg criminal justice system Home Office, Ministry of Justice) or improving the health of the nation (eg Department of Health, DCMS), or informing the public (Cabinet Office schemes), or fostering local news and plurality (DCMS, Ofcom, BBC Trust).

16. Regional press editors, political editors and lobby correspondents continue to note the "never-ending problem of recognition of the regional press" within government press offices whose focus tends to be on achieving broadcast media coverage.

17. The government communication service should consider the needs of the regional media sector as a whole: both those regional daily newspapers with dedicated parliamentary lobby correspondents and also the vast majority of regional and local newspapers who do not have such a London presence.

18. Regional newspapers need a clear, consistent, reliable and responsive government information service. Response to regional press enquiries still varies across different government departments. Direct access to officials or ministers is often difficult. There is a need for greater co-ordination and the introduction of a core best practice across departments.

19. The availability of up-to-date, internet-based background information is of particular importance for non-lobby journalists, and would reduce the time spent by government press officers handling basic enquiries. More thought should be given to the relevant local angle on government announcements.

20. Press releases and articles from ministers aimed at regional newspapers should relate to genuine news stories rather than government advertising messages. These should always provide a contact who understands the policy issues and can respond swiftly to journalist enquiries.

21. We would be happy to provide any further information.

15 September 2008

Memorandum by the PPA

Has the implementation of the reforms of government communications since the Phillis Review resulted in a more effective system of communication and underpinned the principles set out in the report?

PPA

PPA is the association for publishers and providers of consumer, customer and business media in the UK and in this role welcomes the opportunity to respond to the House of Lords Select Committee on Communications inquiry into the Phillis Review of Government communications.

The association's membership consists of some 500 members who publish or organise over 4,400 products or services. These include over 2,500 consumer, business and professional magazines and nearly 1,000 online products. Many PPA members offer online services, including websites, online versions of print publications and publications only available online, or through electronic transmission.

1. Introduction

1.1 The PPA response will focus on areas of direct interest to our members, namely: effective implementation of the Freedom of Information Act 2000 and clearer rules for the release of statistical data.

1.2 Magazines are not mentioned in the 2004 Phillis Review, but they were and are an important part of the British media landscape and democratic process. Since 2004, traditional magazine publishers have increased their online presence and remain a trusted source of information—both in print and online.

Magazines

1.3 It was disappointing that magazines were not mentioned in the Phillis Review as they have a unique ability to connect with special interest groups, for example:

1.3.1 locally, through regional magazines;

1.3.2 to mothers, via one of the many parenting magazines;

1.3.3 with young people, using teenage, popular culture or sporting magazines;

1.3.4 to different ethnic groups through specialist community magazines.

1.4 And we should not forget mass market weekly and monthly magazines—which are read by millions of people each issue.[11]

1.5 A wide range of consumer needs are met by magazines because there is such a variety of them. And it is a growing variety. The increasing number of consumer magazines and websites not only demonstrates a very healthy market but is also a visible sign of increasing specialisation.

1.6 Magazines and websites focusing on more and more specialist areas strike an increasingly personal link with readers who are especially interested in a given subsector.

1.7 Magazines deliver engagement. A study in 2004 by the Henley Centre, *Planning For Consumer Change*[12]—summarised in PPA's report *Delivering Engagement*[13] highlighted how people have become so overloaded with media exposure and information bombardment that it is no longer sufficient for a medium or an advertisement to win consumers' attention: it is necessary to win their active involvement and truly engage them. The Henley Centre concluded that magazines have the characteristics to achieve this engagement in four ways: trust, support, status and participation.

1.8 The Government and the Central Office of Information should recognise the important role of magazines in society.

2. Freedom of Information Act 2000

2.1 "Openness, not secrecy" is the first principle of the Phillis Review—and with regard to Freedom of Information (FoI), this has simply not been the case since 2004. PPA agrees that the Phillis recommendations, "if implemented with vigour and commitment", will help to rebuild trust in Government communications.

2.2 However, after only two years in force, ministers tried to restrict the effectiveness of the Freedom of Information Act 2000 ("the 2000 Act"), designed to give individuals a "right to know".

Draft Freedom of Information and Data Protection (Appropriate Limit and Fees) Regulations

2.3 The proposed Draft Freedom of Information and Data Protection (Appropriate Limit and Fees) Regulations ("the Draft Regulations"), consulted on twice in 2007, would have made it easier for public authorities to refuse FoI requests on cost grounds. PPA responded to both Department for Constitutional Affairs consultations.[14]

2.4 PPA stated at the time the Draft Regulations were being consulted upon, that it was difficult to see the proposed changes as anything other than a deliberate attempt by the Government to avoid difficult or embarrassing FoI requests.

[11] For example, *Take a Break* is read by three million people per week (National Readership Survey, June 2007 June 2008.)
[12] *Planning for Consumer Change*, Henley Centre, 2004. This is partly based on a re-interview survey among BMRB's TGI informants.
[13] *Delivering Engagement: fresh perspectives on getting closer to readers*, PPA Research Report 76, 2004. The brochure may be downloaded from www.hmaw.net
[14] PPA submissions available at: http://www.ppa.co.uk/cgi-bin/go.pl/legal/article.html?uid=11530&topic_uid=79 (March 2007); and http://www.ppa.co.uk/cgi-bin/go.pl/legal/article.html?uid=11866&topic_uid=79 (June 2007).

2.5 The Government stated in the second 2007 consultation that it was not their intention to hinder legitimate requests or reduce the effectiveness of the 2000 Act. This may not have been the intention, but it would undoubtedly have been the result. Information that ought to be disclosed in the public interest could have been kept confidential—due to it being embarrassing or inconvenient for Government or local authorities—using the new "consideration time and consultation time".

2.6 There was no assessment of the type of request that could have been refused—the whole rationale was based on economics. However, the cost of administering FoI requests is relatively modest for visibility and accountability across Government and public authorities; especially when considered in relation to other Government expenditure.

2.7 According to Frontier Economics, which undertook the Government commissioned report, the estimated annual cost of the 2000 Act is £35.5 million. The maximum likely savings that the proposed changes would have made is £10 million across the whole public sector. This pales into insignificance when compared with the £300 million plus that was being spent on PR and marketing around the time of the consultation on the Draft Regulations, with over 3,200 press officers employed in Whitehall.

2.8 The Government report did not consider the disproportionate effect that the proposals would have on the media and genuine investigative journalism.

2.9 The proposed aggregating of requests would clearly have disadvantaged the media, including magazine publishers, who may follow an issue (in the public interest) over a period of time and need to make numerous requests in order to investigate a story properly and professionally.

2.10 Comments from PPA members:

2.10.1 "11 years on, seven years after introducing an information bill and after just two years of, on the whole, successful implementation of the Freedom of Information Act, the government wants to rein in its wild child." *New Statesman*

2.10.2 "There are better targets for penny-pinching than the cheap and effective Freedom of Information Act, but watering it down might make official lives a bit easier." *Economist*

2.11 PPA welcomed the decision of the Government to drop the proposed restrictions to the 2000 Act.

Other attempts to water down the Freedom of Information Act 2000

2.12 The Private Members Bill introduced by David Maclean, "A bill to amend the Freedom of Information Act 2000 to exempt from its provisions the House of Commons and House of Lords and correspondence between Members of Parliament and public authorities", was apparently aimed at protecting correspondence between MPs and their constituents.

2.13 However, confidential information about private individuals is already exempt from disclosure under section 40 of the 2000 Act.

2.14 The Maclean Bill would have effectively exempted the House of Commons and the House of Lords from having to disclose information under the 2000 Act. With hindsight, this would have importantly excluded MPs expenses.

2.15 Unexpectedly, nearly 100 MPs—including around 20 Ministers—voted in favour of the Bill in May 2007. Described by Lord McNally as a "squalid little Bill", it gained no support amongst the Lords.

Positive steps

2.16 There have been instances of openness since 2004; and a couple are worth raising. But it is important that the Government is not able to overturn decisions to disclose information where there is a legitimate case for disclosure.

2.17 The Information Tribunal's recent decisions on access to policy advice—showing that the Tribunal has required disclosure not long after the relevant Government decision was taken. The Government has, however, challenged the Tribunal's approach.

2.18 The Information Commissioner's decision that memos relating to the Iraq war dossier sent by political figures ought to be disclosed. The Government has fought for three years against disclosure on the grounds of national security.

3. Clearer Rules for the Release of Statistical Data

3.1 PPA continues to maintain an interest in ensuring that Government has clear and concise rules for providing public sector information (PSI) as easily and conveniently as possible.

3.2 PPA members rely on access to many kinds of PSI in order to deliver relevant and timely information—but often find themselves competing in the market place with Government, or relying on Government as a source of information for which they have to pay.

3.3 PSI is particularly important for business media, which makes up a large part of PPA's membership.

3.4 "Public information does not belong to government; it belongs to the public on whose behalf government is conducted". Prime Minister Tony Blair.

3.5 In the digital age, information is a massively valuable resource—and this applies for Government as well as business. The Government has an unbelievable amount of information about a whole range of things—from the natural environment to personal habits—collected by millions of public servants. And from this information, the Government runs businesses in the knowledge economy—making profit.

3.6 If the information is commercially valuable to Government, it is commercially valuable to business too—but the current situation tends to squeeze out the private sector.

3.7 The Technology Guardian's Free Our Data campaign has argued that the wider economy—as well as democracy—would be better served by making nearly all government data available for free. PPA supports the Technology Guardian's campaign.

3.8 "The Re-Use of Public Sector Information Regulations 2005" ("the PSI Regulations") implement Directive 2003/98/EC on the re-use of public sector information. PPA strongly supports the aims of the Directive and the PSI Regulations on the re-use of public sector information, but despite some positive steps, believes that there is still work to be done.

3.9 PPA welcomes the Governments' recent commitment to make PSI free, or not charge more than the marginal cost of maintaining and distributing the extra copy, by signing the Seoul declaration for the future of the internet economy.

3.10 The declaration recognises that "Public organisations are a major source of information, an increasing amount of which is digitised or produced in digital form and can be re-used in innovative ways for significant economic and social benefit." And calling for the removal of "unnecessary restrictions on the ways in which it [PSI] can be accessed, used, re-used, combined or shared".

3.11 Although not binding on UK public bodies, the declaration is welcome news and PPA hopes that the system for re-use of PSI becomes more open and with fewer obstacles.

4. Conclusion

4.1 Progress has been made since the 2004 Phillis Review, but the areas highlighted above remain an issue for PPA members.

4.2 Magazines and their associated websites play a vital role in UK society and have unique qualities. The Government and the Central Office of Information should ensure that they utilise these qualities of trust, support, status and participation.

4.3 PPA would welcome giving oral evidence to the committee.

September 2008

Memorandum by Prospect

Introduction

1. Prospect is a TUC affiliated union representing the majority of staff employed in the Government Communications Network (GCN). Our members employed in this community are highly professional specialists, often working under pressure in an ever changing environment. Prospect has a strong commitment to enhancing skills and career development opportunities for GCN members, and continues to be involved in ongoing discussions regarding the GCN People Strategy, and with the Cabinet Office on a coherent pay and reward strategy for this group of specialists.

What's Happened?

2. Prospect welcomed the Phillis Review, and the inclusion of a number of the recommendations made by Prospect in the report to the Prime Minister. In particular the recommendations relating to integrated departmental communications structures, led by a new Permanent Secretary, and consistency in recruitment, training and development opportunities for communications specialists. Our recommendations to the Phillis Review included:

- induction and ongoing training and development are fundamental to the effective functioning of Government communications;
- adequate funding is essential to ensure sustained and increased confidence in the information provided by government;
- pooling of good practice, ensuring this is actively shared across departments and agencies;
- clear guidance and procedures are put in place to enable communications specialists to seek assistance and advice with regards to professional issues and issues of propriety;
- the Civil Service "fast stream" needs direct experience of the nature of communications work; and
- the need for communications specialists to be able to move easily between departments/agencies to enhance skills, and also to encourage cross fertilisation of knowledge and to encourage best practice.

3. Following the Phillis Review, GICS was disbanded and the Government Communications Network launched. A number of processes were put in place to address the recommendations of the report, including the setting up of GovGap, Directgov and the Engage programme. GovGap, launched out of the Central Office of Information (COI), is a resourcing service assisting government/agency communications teams with shortfalls in staffing, and variable workload issues. It also includes processes allowing permanent staff to move around government departments/agencies through secondments and temporary assignments. Direcgov, also launched out of COI, provides information on government services online aimed at the general public, available through the internet, phone and satellite/cable television. The Engage programme promotes best practice strategic communications skills across government. Additionally, GCN recently introduced a professional competency framework, and have created a network of Development Advisers.

Progress

4. Progress on implementing the recommendations of the Phillis Review has been extremely slow. However there is no doubt that the processes outlined above go some way to addressing the recommendations in the Review.

5. The GCN has provided a central communications structure putting in place processes which ensure strategic leadership for communications across government. However, concerns remain that there are areas within Government that remain outside GCN influence. For example Prospect GCN members in the Ministry of Defence continue to be concerned at the management capability of military personnel who enter into management roles from unrelated specialisms. There are no full-time specialists in the Armed Forces. Training appears to be minimal and has an adverse impact on how communications specialists are managed, particularly with regards to their performance management and continuing professional development. Military personnel are also subject to be moved after two or three years, with the result that communications specialists have no consistency in how they are managed.

6. Govgap was set up as a resource service to assist with shortfalls in staffing, for instance to cover maternity leave, and to provide a range of options linked to the specific needs of departments/agencies, providing extra resource for project work for instance. It is also aimed at giving staff the opportunity to enhance skills and gain experience through secondment opportunities and temporary assignments across the GCN. Although there has been some success with GovGap in helping with the skills mix available in the GCN, the lack of a coherent pay strategy presents a barrier to the movement of professional staff. Market pay issues also impact on the availability of freelancers, leading to an increase in the use of more expensive contractors. Staffing pressures in most areas also prevent existing permanent staff from taking part in secondment opportunities. Concerns remain that the movement of staff from administrative/policy areas into the GCN dilutes the expertise of the network, whilst the movement of media specialists into other areas of the Civil Service remains virtually non-existent, preventing the facilitation of a healthy cross-pollination across the GCN network.

7. The launch of Directgov has been a positive development in disseminating information and improving communications with the public. The movement of what was the Government News Network, sitting alongside Government Offices in the Regions, into the COI, has also had a positive impact on regional communications.

8. The introduction of the GCN Competency Framework has resulted in more consistency in recruitment to the GCN with regards to professional skills and standards. The Competency Framework also links to performance management, training and continuing professional development. However, with devolved performance management systems inconsistencies remain across departments/agencies as to how performance of communications specialists is managed and rewarded, impacting negatively on professional standards. There are also inconsistencies in the provision of training and development, apart from the training provided through the GCN programmes there is no coherence apparent in terms of efficiency, intelligence and evaluation of training programmes across departments/agencies.

9. The Engage programme, set up to assist communicators understand and apply a range of advanced strategic communication techniques and skills needs to underpin further work to identify the existing knowledge and skills available within the communications community. An area where further work is necessary in the GCN is within the Civil Service "fast stream" which still has no communications specialism. This continues to present barriers into how future Senior Civil Servants understand the fundamental role that GCN has in the policy process, as well as preventing the opportunity to develop professional communicators from the graduate pool.

10. Prospect remains frustrated at Civil Service rules that inhibit and prevent communications specialists from progressing within their specialisms. It seems to us that there is a real issue that staff in senior grades with in depth specialist expertise lose out on performance assessments undertaken through the PSG framework, as the "generic" skills of PSG will effectively take precedence over job related professional expertise. There is the potential for this to result in communications specialists giving up their specialism to enter into management grades.

11. By far the biggest barrier to members of GCN being able to move easily between departments and agencies, to enable them to enhance their knowledge and skills is the disparities and unfairness inherent in devolved terms, conditions and pay and reward in government departments/agencies. Different pay rates and structures lead to inequality amongst staff, as well as preventing barriers to movement around the communications network. There are huge disparities in pay, for example, SIOs in Government Offices have a pay scale maximum of £47,472, whereas in DfT the comparable figure is £44,108, and in CLG the figure is £39,227. The main employer of communications professionals, COI pays £43,273 at the maxima (all rates 2007). These disparities impact, not only on staff wishing to develop their skills/experience through secondment opportunities, as they could be working alongside staff, doing the same type of job, but for significantly less pay, but also creates the situation where staff apply for posts in departments/agencies based on the salary payable, rather than logically planning career development, as well as creating competition between departments/agencies.

12. In a recent Prospect pay survey, communications specialists responded that low pay is a great concern. Out of 200 responses 63% indicated that they were more dissatisfied in their workplace than a year ago; 74% are angry at the lack of pay progression; 49% say poor pay and career opportunities have driven them to look for a job outside the civil service; 85% are poorly informed about the Professional Skills for Government programme; and 77% indicated that they work longer than their contractual hours, including 85% of managers. Clearly there are problems with pay and structures within the GCN which need addressing.

13. Further analysis also needs to be undertaken with regards to the external pay market. Higher pay in the private sector, apart from creating problems with "leap frogging" whereby external appointments are paid higher salaries than existing staff, if the GCN wants to attract highly qualified and experienced professionals, it needs to ensure pay and reward is competitive.

14. Many of the issues around terms and conditions, and internal reward would disappear if a single pay and grading system was developed and applied across the GCN. Prospect continues to be involved in a Reward Working Party through the Cabinet Office, set up to look at certain groups of specialist pay and reward across the Civil Service, however, to date there has been no positive movement in the communications specialist area.

15. In conclusion, we believe that although clearly, there has been progress and processes have been put in place to address the recommendations of the Phillis Review, certainly in areas dealing with training and development, performance, and pay and reward, further work and analysis needs to be undertaken in creating a coherent approach to remove inconsistencies and barriers to staff movement.

September 2008

Memorandum by the Public Relations Consultants Association

1. Background to the PRCA

The Public Relations Consultants Association (PRCA) welcomes the opportunity to respond to the call for written evidence issued by the House of Lords Select Committee on Communications on 17 July 2008, as part of the Committee's Inquiry into Government Communications.

By way of background, the PRCA was established in 1969, and is the representative body for public relations (PR) consultancies in the UK.

The Association provides support to PR consultancies to enable them to become better businesses, and helps to demonstrate the value of public relations consultancy to clients. It also works to deliver and enforce accountability and high standards. PRCA members must pass the Consultancy Management Standard—an independently assessed audit of their business operation—and must adhere to rigorous ethical codes of conduct.

It has over 160 members across the UK, and represents consultancies which cumulatively account for well over half of the consultancy fee income generated in the country. These consultancies are of all sizes, working for clients in all business, public sector and not-for-profit sectors. Together, they employ around 5,000 people and generate more than £400 million each year in fees from clients.

2. Summary

The PRCA believes that despite the great talent which exists within the civil service press operation, it continues to fall short of rising public expectations.

It also believes that while improvements have been made (most notably since 2004 under the leadership of Howell James), much remains to be done. In particular, problems of perception remain large—and most likely considerably exceed the real issues that exist.

At a macro-level, the Government has taken welcome steps in recent years to diminish the public perception of "spin" and political interference. However, that perception remains considerable. There is a clear public distrust of the impartiality of Government announcements, and a suspicion that much of what is released is partisan rather than impartial.

The UK has developed a hybrid of the old-style impartial civil service, and the US-style of highly-politicised senior-level administration operators. It is our view that this hybrid is unsatisfactory, and that either turning back to a fully traditional British model—or else explicitly embracing an American model—would be highly attractive as it would ensure clarity of purpose and responsibility.

At a public-facing level, too little is invested in easing citizens' access to information. Public sector websites continue to be among the worst organisational ones. They all too often contain redundant pages and non-operational links; their search engines are unwieldy, slow and uninformative. Despite improvements, this remains true of Parliament itself and of central Government Departments.

Taken broadly, Parliament itself needs to examine the activities of its members, and to ask whether those activities increase or reduce public confidence in Government communications. There remains a clear need for Parliament to create its own, entirely non-partisan, identity and brand.

3. Proposals

SPADs renamed and more visible

Special Advisers play a valuable and necessary role in the governing and political processes. They (rightly) serve to deflect political questions away from impartial civil servants. And it would be fair to say that their role has matured over time.

However, while Westminster insiders appreciate that role, to those outside of the golden circle of privileged access—politicians, high-level civil servants, and political journalists—it remains ill-defined and much misunderstood.

Their title is also something of a misnomer. They would be better described as Political Advisers, not least to distance themselves from the "Specialist Advisers" who also work in the public sphere.

It would be better for the perceived impartiality of the civil service press operation, and for the clear functioning of Government, if SPADs were to be more visible, acting as quoted and named spokesmen for their Ministers. In that way, they could speak as clear political voices, leaving the everyday business of Government (as opposed to political) communications to civil servants.

Binding and enforced remit for civil servants

Civil servants need to be given more support in defending their legitimate impartiality against attempts to put the governing party's flavour on Government statements. In saying this, we recognise that the vast majority of statements are factual in nature—but a minority of politically-slanted releases still exists, and serves to colour perceptions.

The Civil Service Code should therefore be enhanced to provide civil servants with a much-needed definitive statement of their role. It should include robust measures for ensuring that the *de jure* prohibition on SPADs attempting to "lean" on civil servants is universally transformed into a *de facto* prohibition too.

In order to deal with extreme cases of undue pressure, thought might usefully be given to an explicit civil servant whistleblowers' charter for dealing with illegitimate political pressure.

Decision re US-style administration

As suggested above, the UK system has moved from a very traditional split in responsibility to one that broadly resembles its traditional style, but now also contains significant elements of a political-appointments arrangement as seen most notably in the United States.

The current Government's decision in 1997 to replace a large number of departmental communications heads continues to colour the views of civil service communications professionals about expectations; and has a long tail on media and public perceptions.

Both the openly political model of senior administrative posts, and the entirely non-partisan model have attractions. What is not attractive however is the current halfway house. In our view, it would be better to move to one system clearly, thereby making responsibilities more obvious.

New Civil Service Act defining impartiality

Overlapping all of the points above is the need for a comprehensive and robust Civil Service Act that addresses these problems in the round.

There is an obvious temptation for political parties to make political capital out of this breakdown in trust between the Government, the governed and the media. But the slow erosion of public faith did not begin under the current administration, and threatens to taint the work of subsequent administrations of whatever political hue.

Such a Civil Service Act should therefore be approached in a non-partisan way, with the support of all parties represented in Parliament. Otherwise, it will clearly lack credibility.

Corporate identity for Parliament

One of the striking omissions in public sector communications is the lack of a corporate voice and brand for Parliament as an institution. All too frequently, issues affecting Parliament as a whole are addressed by politicians themselves, inevitably introducing a party political element.

While it is inevitable that certain issues will be party political in nature, there is a significant number of cases where this is not so, and where an apolitical voice would serve Parliament better.

We recognise of course the argument that the Speaker fulfils this function. However, he represents only the Lower House, and Speakerships are not always entirely free from controversy themselves.

At a minimum, Parliament should develop an accessible and fully searchable website. While the current version is doubtless an improvement on what existed before, it still leaves a lot to be desired.

More fundamentally, Parliament should give proper thought to the establishment of a robust and modern corporate identity, expressed, for example, through a properly-resourced and absolutely non-partisan press office. We recognise that this might itself be the subject of some unfavourable coverage, but such a consideration does not detract from the need for action.

Clarity on MPs' communications allowances

One controversial area that impacts upon the public opinion of Government communications remains the activities of MPs themselves.

While there is broad agreement that MPs need to be able to communicate with their constituents, the use by certain MPs of their communications allowance for what might be seen as party political campaigning is injurious to the image of Parliament and of the public sector communications effort more broadly. It might be better if these communications allowances were pooled and administered centrally by Parliament as a corporate body, making constituents aware of relevant information on their MPs' activities.

4. Conclusion

The PRCA would argue that there is a clear need for Government communications to be improved, and that this need should be addressed comprehensively, encompassing not just central Government Departments, but also the broader public sector and Parliament itself.

Having said that, we would not wish to obscure the fact that the current position is a significant improvement on that which existed just a few years ago. Our central concern with regards to central Government communications is that public perception continues to be considerably worse than reality—and that serious measures are therefore needed to shift this perception.

We should recognize that at a time of pressure on the public finances, and the reasonably close proximity of a general election, enhancing the way that Government communicates with the public might not appear to be a top priority. We are also aware that there will be inherent tensions in a system which seeks impartially but deals with politically contentious issues.

However, the public deserve top-quality communication from those who spend their taxes and act in their name. And while it is tempting for political parties to make capital out of such issues, they should bear in mind that such pressures affect all governing parties.

We would, of course, be delighted to expand upon these brief observations.

29 September 2008

Letter from the Society of Editors

Inquiry into the Implementation of the Phillis Review

Please extend our apologies to the chairman and committee for the delay in this response.

We welcomed the setting out of the seven key principles for government communications in the Phillis review. There has been progress towards achieving them but the pace of change has been variable. Perhaps the measure of success of the implementation of the Phillis recommendations is that we still have to campaign vociferously to encourage the adoption of the principles.

The first and most important of these principles is "Openness, not secrecy". There has certainly been some progress in what is a cultural change that must be carried down to all layers of government. Organisations have begun to realise that releasing information without waiting for requests or pressure is not only helpful in itself but can reduce work pressures, for instance in responding to Freedom of Information requests.

We have made these points forcibly in the Ministry of Justice Information Users' Group, particularly when there were concerns that proposals in the review of the working of the FoI Act might be regressive. Fortunately the government thought twice and did not proceed with those proposals. That helped to maintain the tone of cultural change, as have more recent announcements from the Secretary of State for Justice regarding openness in the courts.

There have been more direct, unmediated communications with the public but changes in this regard are not always the most valuable. The public benefit from communication through the media. Reports are generally based on professional questioning about the information released.

Progress in these and other areas needs be stepped up or sustained over a long period and should not merely be related to the issues that led to the establishment of the Phillis inquiry. Many of the problems that were examined were symptoms of deeper concerns and that is why cultural change at all levels of government needs to be promoted continually.

Concerns remain about the role of special advisers and it is not clear that changes following the Phillis report have been totally beneficial. We had a close and valuable working relationship with the head of GICS that was mutually beneficial. It provided for ways of discussing problems and promoted better understanding and led, for instance, to the creation of the Media Emergencies Forum and its regional equivalents. Sadly that relationship has not continued with similar strength or purpose and the MEF and other less formal joint forums have suffered as a result.

The society particularly welcomes the chairman's comments regarding regional communications. The regional media offer huge opportunities for improving communications between government and the public which have never been fully exploited. We have long argued that government in Whitehall and in the regions could achieve far more through closer relationships with regional media.

I hope these brief points are of some value. We would of course be happy to expand on them if required. Our current president has a national broadcasting background and he will be succeeded by an editor from a regional daily newspaper in November. I represent the society in meetings with government departments and in bodies such as the MEF and the Information Users's Group. We would all be pleased to help the committee further.

Jeff French
Director
National Social Marketing Centre

We owe thanks to many people across the fields of government, voluntary sector and business for their insight and support in helping us to produce *It's our health!*

We would like to thank the Public Health Minister Caroline Flint and the Department of Health (DH) for their lead in agreeing to commission the review as a white paper commitment in *Choosing health*. We would particularly like to acknowledge the support and encouragement we received from Fiona Adshead, Deputy Chief Medical Officer, and Siân Jarvis, DH Director of Communications and Matt Tee, along with John Bromley, Wyn Roberts, Mark Sudbury, Fiona Samson and Julie Alexander, and everyone who has actively contributed to the steering groups.

We have valued the expertise, energy and hard work of Clive Blair-Stevens, Sarah Hardcastle, Dominic McVey, Catherine Slater, Lucy Yates, Siân Evans and Fiona Nicol, our colleagues at the NCC National Social Marketing Centre. We would also like to thank Centre associates Ben O'Brien, Emma Heesom, Clive Needle, Kaye Wellings, Tim Jennings, Adam Crosier, Karen Bulsara, Kristina Staley, Roslyn Kane, and Jane Lethbridge for their contribution to the review.

Finally, we are grateful to the many hundreds of people that we have met and who have shared their views and ideas with us. We would like to thank everyone who has provided evidence and information, helped us to examine and question the issues, and ultimately who have informed the findings and recommendations contained in *It's our health!*.

This report is a summary of a fuller report that is available on the website **www.nsms.org.uk**, together with the 12 supporting papers and reports that have informed it. The full report includes further information and detail on the work of the review and its findings, along with illustrative case examples.

"The importance of applying social marketing principles to the development of social policy and strategy cannot be overstated especially in the area of health."

Alan Andreasen – Professor of Marketing Georgetown University

The case for social marketing

It's our health

Health is something to enjoy – not a cross to bear. But, the nature of public health and the challenge of promoting it, is changing. Today our attention is focused as much on chronic disease as on infectious disease. The rise in obesity, the problems of alcohol and drug misuse, sexual health, smoking and mental health are all key concerns.

People must be placed at the heart of the new public health challenge. After all, it is their health. It is ordinary people who provide most of our health care, who disseminate health information and influence our behaviour. It is people who not only pay for the NHS, but spend over £30 billion each year on promoting their own health and wellbeing.

The challenge that we explore in *It's our health!* is how to put people at the centre of a public health strategy. We have done this by examining the potential of social marketing to help promote health in England. This is a direct response to the government's *Choosing health* white paper, which recognises that more of the same would not deliver the health improvements that people need.

The review sets out how we can improve prevention and promote healthier ways of living by using what we know works. What is clear is that any attempt to improve people's health must include concerted and sustained action to help people change their behaviour.

It's our health! concludes that the DH should deliver a *National Social Marketing Strategy for Health*. Such a strategy, based on the recommendations that we make, would significantly help to improve the impact of our efforts to improve people's health.

Prevention saves money

At a time when efficiency and cost savings are high on the agenda of politicians and government, the single most important opportunity that has yet to be grasped is the economic benefit of preventing chronic ill health. Prevention is not straightforward for government. It's long term and not highly visible. But, the success or failure of prevention touches everyone's lives. Four out of five deaths in the UK of people under 75 could probably have been prevented. Existing public health campaigns are not currently reaching those who continue to smoke, take little exercise, eat poorly and drink too much. The financial cost of preventable ill health ranks alongside our economic stability and international security. Our economic analysis estimates that the total annual cost to the country of preventable illness amounts to a minimum of £187 billion. In comparative terms this equates to 19% of total GDP (gross domestic product) for England.

Effective prevention is a win-win solution for people and the economy. We calculate that every single 1% improvement in health outcomes that result from prevention and social marketing could reduce public expenditure by £190 million. Not only that, it could save families £700 million, reduce employer costs by £110 million and generate considerable social value by reducing the level of premature death and disability.

Although there are signs of welcome progress in the treatment and care of disease in the UK, there has been less impact in the area of primary prevention of disease and support for positive health. If we are to achieve what Derek Wanless describes as the 'necessary maximum attainable shift in population health' in his review of NHS funding, we must reinvigorate our efforts to promote public health.

Putting people at the heart of public health

The starting point for a fresh approach to prevention is the recognition that simply giving people information and urging them to be healthy does not work. Rather than attempting to sell health, we need to understand why people act as they do and therefore how best to support them. So, alongside providing effective health information and supporting communities and individuals to improve their own health, we need to encourage and release the energy, skills and desire for good health that they already have.

This core idea, of starting from where people are and focusing on what support they need to make changes in behaviour, explains the shift that we recommend from an awareness approach to a social marketing strategy.

A micro history of public health campaigns

England has a long history of organised health improvement. This has included phases focusing on sanitation, hygiene and propaganda. Since the 1950s health education, community development and the application of broader health promotion techniques have all been used. The approach of social marketing, developed in the 1970s while different, builds on a long and positive tradition of reaching out to the public to promote good health.

The Health Education Council (HEC) was a non-governmental organisation that led work on health-related campaigns for many years until 1986. In 1987 it became the Health Education Authority (HEA), and a formal part of the NHS tasked with undertaking national health-related campaigns.

In 2000 the HEA closed down and the Health Development Agency (HDA) was established to focus on public health evidence and development. Direct responsibility for national campaigns was brought into the Department of Health. In 2004 the HDA was merged with the National Institute for Health and Clinical Excellence (NICE) as the Centre for Public Health Excellence.

Building on what we know works

Marketing is very powerful approach to changing behaviour. Of course, health is not a commercial product. This is why a significant international body of experience, including our review, has focused on adapting marketing methods to the specific and distinctive context of public health. The result is social marketing.

Social marketing is not designed to replace other aspects of the public health. It is part of the toolkit that can be used in a strategic way, to inform the mix of interventions such as regulatory action, or practical, hands-on methods to support specific behaviour change.

Actions that focus on individuals and wider society factors need to go together. For example, this review revealed startling evidence on the effectiveness of social marketing in relation to smoking, comparing the UK to Australia. Back in the 1970s, both countries had comparable smoking rates. Even accounting for the boost to non-smoking that will occur thanks to the new restrictions on smoking in public places, England is unlikely to reach the point at which no more than 5% of the adult population is smoking until around the year 2060. Australia is set to reach this goal 40 years earlier, in 2020. Moreover, in contrast to the UK, Australia does not have universal smoking bans, few smoking cessation clinics and no national nicotine replacement service. What Australia, Canada and other more successful countries have done is to focus a sustained effort on helping people change behaviour and not take up smoking in the first place by applying many social marketing principles.

Social marketing in practice

This review sets out strategic and operational recommendations for how the Department of Health can develop and implement a *National Social Marketing Strategy for Health*, as part of its *Choosing health* and *Our health, our care, our say* policy. The review also makes recommendations about how to mobilise the contribution of all sectors to achieve a wider social movement for better health.

‘VERB, it’s what you do’

US Department of Health and Human Services Centres for Disease Control and Prevention, 2002 to present

Social marketing campaign to increase physical activity among tweens aged 9 to 13 years, after one year:

- 32% decline in the number of sedentary 9 to ten-year-olds
- girls demonstrated a 37% decline in sedentary activity
- lower middle households showed 25% more physical activity
- 38% decline in sedentary children from low-income homes.

www.cdc.gov/youthcampaign

It recommends that social marketing should be used in the development and implementation of all government-led attempts to promote positive health-related behaviour. The approach builds on three themes:

- Put people at the centre of policy thinking and build services around their needs
- Apply what works and stop what does not
- Build partnerships and joint commitment for improving the health of the nation between the government and individuals, and with the private and the NGO sectors.

These themes present a challenge to look again at existing skills and methods and to build on the best of current experience while making some hard decisions to adapt or cease action in other areas.

Addressing some of the myths or confusions about social marketing will be important if we are to effectively mobilise its potential. This review has shown that when people have an opportunity to examine and understand its core principles and approaches, they increasingly see ways that it can enhance and assist their practice.

What won’t work is a superficial adoption of social marketing. Any attempt to just ‘bolt’ social marketing principles on to existing programmes, or to use its language without applying its disciplines, will have little impact. If social marketing principles are only used to run ‘smarter campaigns’, we will fail to deliver a consumer-focused strategy. If only a few specialist workers take up social marketing, it will have minimum impact. The challenge is to move beyond merely bolting on social marketing to existing approaches and integrate its principles to guide all efforts to help improve people’s health.

Getting the most out of what we have

A key finding in *It’s our health!* has been that there are many assets that can be better used to provide support for behaviour change. There is also great potential to increase investment by developing active partnerships with the NGO and private sectors, and not-for-profit organisations, many of whom share the same goals of promoting health and wellbeing. Our public services and the skill of staff that work in them represent a fantastic intelligence gathering network, and a social marketing asset capable of helping every person in the country.

It is common sense that prevention is better and cheaper than cure, but such common sense needs to be backed up by research and economic evaluation. There is growing evidence that well executed and sustained social marketing programmes work, and are cost effective when delivered as part of a comprehensive strategy. The announcement to review public health funding set out in *Our health, our care, our say* will help determine the level of investment that is required.

Shaping our future health policy

Social marketing can help build a deeper understanding of what health and risk mean to people. It can also help to recognise the constraints and enabling factors that shape people’s everyday decisions and actions. Social marketing includes concepts that can shape policy and its implementation to promote positive behaviour and influence the provision of services. The nature of social marketing, with its focus on establishing unambiguous behavioural goals, can also facilitate a better approach to measuring effectiveness and accounting for the use of public funds. A *National Social Marketing Strategy for Health* will, we believe, allow more people to enjoy the health that shapes their lives.

Recommendation

We recommend that the government, and Department of Health in particular, demonstrate their commitment to develop a genuine consumer-focused social marketing approach and respond to the findings of this review by establishing its first National Social Marketing Strategy for Health.

Specifically, we recommend that the strategy is based on the aims and objectives set out in this review.

The following *Starter for 10* has been developed to explain what social marketing involves. A further description of social marketing is included in Appendix A, and other material can be accessed via the website **www.nsms.org.uk**.

Social marketing

A starter for 10

1. **Starts and ends with a focus on the person and what's important to them**
   Whether as consumer, citizen, client, customer, patient, service user etc, social marketing does not approach people in isolation, but considers them in their wider social context.

2. **Has roots in both best public and commercial sector practice**
   It is not just concerned with commercial marketing approaches, but draws on many years of social cause and social reform work across different sectors.

3. **Is an adaptable approach that can be used with small and large budgets**
   It can be used strategically and operationally, supporting development work whether there's a £200 budget or £20 million!

4. **Does not compete, but integrates with best public health, health promotion and health communications' practice**
   Its value is that it has demonstrable potential to enhance responsiveness and improve impact and effectiveness of different interventions.

5. **Uses whole-systems, holistic and wider determinants thinking**
   It integrates a clear focus on the individual with the need to address wider influences and inequalities.

6. **Has a broad inclusive theoretical framework**
   It draws on, and helps to integrate: biology; psychology; sociology; and environment or ecology theory.

7. **Actively considers and is concerned with ethical issues and values**
   Its systematic approach means that ethical issues and values are examined. It recognises that anything that seeks to influence or promote particular behaviour presents a range of ethical issues that need to be addressed.

8. **Is a great deal more than advertising and communications**
   It uses a broad marketing mix of methods. In some cases a message-based communication approach or advertising may not be used at all.

9. **Challenges top-down paternalistic 'we know what you need' approaches**
   It starts where the person is at now, not where someone might think they are, or should be. Understanding what is important to the person is a crucial focus.

10. **It works!**
    There is a growing evidence-base to show that social marketing can significantly improve impact and effectiveness.

1. The national review

Why the review was undertaken, how it was done, and what it involved.

Why the review was undertaken

This independent national review was commissioned by the Department of Health as a commitment from the cross-government public health white paper *Choosing health.*

The discussion and consultation that fed into the development of the white paper highlighted a number of concerns:

- a growing realisation that continuing with existing methods and approaches was not going to deliver the type of impact on key health-related behaviour that was needed
- other comparable countries appeared to be achieving more positive impacts on behaviour by using and integrating a more dynamic consumer-focused social marketing approach into their methods
- current understanding and skills in social marketing appeared limited, and it was not immediately evident in either professional or academic training and development programmes.

As a result it was agreed that a national review should be undertaken to examine ways to improve the impact and effectiveness of health promotion, and in particular to consider the potential contribution of social marketing at national and local levels. The need to examine current understanding and skills among key professional and practitioner groups was also part of the review.

As a principal advocate for a more consumer-focused approach, the National Consumer Council (NCC) was asked to lead this work. This recognised that an independent review would draw up recommendations to address existing practice across the DH that could be considered and developed outside of current DH responsibilities.

How it was done

The work was progressed as a joint initiative between the DH and NCC under the initial banner of the *National Social Marketing Strategy for Health*. A core strategy team was established and based at NCC, and joint accountability mechanisms put in place via a DH/NCC steering group.

The original remit included an examination of the options to meet the white paper commitment to establish 'an independent body' to progress health-related social marketing work. However, in October 2005 the DH decided that this commitment could be met by asking the NCC to act as the independent body, and to develop the strategy team further into a new National Social Marketing Centre. The governance arrangements and the aims and objectives for the NSM Centre are included in Appendix B.

"The beauty of social marketing is that it doesn't try to point the finger and tell people things, but starts from where they are now. So we can build programmes that people really want and will respond to."

Emma Heesom – Corporate, Communications Manager, Heart of Mersey

Summary of projects that have helped to inform the national review and contributed to the final recommendations:

1. Effectiveness review: physical activity and social marketing
2. Effectiveness review: nutrition and social marketing
3. Effectiveness review: alcohol, tobacco and drug misuse and social marketing
4. Social marketing capacity in the UK: academic sector – initial selective review
5. Social marketing capacity in the UK: commercial sector – initial selective review
6. Social marketing for health in the European Union – initial selective review
7. National health-related campaigns review – selective review of eleven campaigns
8. National stakeholder research findings – current understanding and views
9. Summary review of current use of social marketing across government
10. Health economic analysis: initial look at the societal costs of preventable ill-health
11. Social marketing research – compendium of social and market research sources
12. Overview of key behavioural trends and targets related to *Choosing health* priorities

Further details and related papers are available on our website www.nsms.org.uk

What it involved

Gaining a broad view – using a mix of methods and approaches

The findings and recommendations in this review have been compiled using a mix of methods and approaches. This has included discussions with a wide range of policy-makers, field practitioners and academics across different sectors at national, regional, and local levels and a research programme of 12 individual reviews (see above). A summary of the organisations that have informed the review is included in Appendix C. Further information is available in the full report via the website **www.nsms.org.uk**

Network of field contacts interested in social marketing issues

In addition to the many one-to-one interviews conducted by the NSM Centre team, and the formal research projects, the team gave 148 workshops and seminar sessions across the country during 2005 to 2006 that reached over 5,000 people. At all events people were encouraged to give their views about how our individual and collective work to promote health could be enhanced, and the potential of social marketing to support them. Reaction to the events was positive. It is clear that many people are concerned about how their efforts could be enhanced to achieve greater impact and effectiveness. During the course of producing this report the NSM Centre team developed a growing network of national and international social marketing contacts and advisers.

2. The findings

Summary of the five key findings

Overall the review confirmed that the Government was right to commission an independent national review. While there are positive aspects to previous work and a range of skills and assets it can draw on, it is increasingly clear that important changes need to be made by Government and the Department of Health in particular, if it is to improve its ability to achieve the challenging health goals it has set itself.

The findings of this review have been grouped into five key areas. It demonstrates that adopting a strategic social marketing approach has real potential to improve the impact and effectiveness of health improvement efforts at all levels.

The next section expands on each of these five key findings. Each finding has an 'In short we found' section for those wanting to rapidly scan content and an 'In more detail' section providing further detail.

The subsequent recommendations section then picks up on each of these areas, with a specific set of recommendations for strategic and operational objectives.

Summary of the five key findings

1. **Social marketing can significantly improve impact and effectiveness when applied systematically**
2. **There is potential to use available resources and mobilise assets more effectively**
3. **Current approaches are unlikely to deliver the required policy goals, leadership and effective co-ordination are key to success**
4. **Social marketing capacity and capability across the wider public health system is currently under-developed**
5. **The importance of integrating effective research and evaluation into the development of programmes and campaigns to maximise its value.**

The findings
Finding 1

We considered the extent to which:

- evidence is available to confirm the potential benefit of using social marketing
- social marketing was understood and being integrated into the methods and approaches being used and applied at national and local levels.

Finding 1: Social marketing can significantly improve impact and effectiveness when applied effectively

In short we found:

- there is enough evidence to demonstrate that using social marketing systematically can significantly enhance and improve the impact and effectiveness of health promotion
- understanding of social marketing at national and local levels in the UK is still relatively limited. As a result we are not as yet benefiting fully from its potential to enhance and improve the impact and effectiveness of health promotion interventions to achieve behavioural goals
- many aspects of established and traditional approaches have clear value, and therefore efforts to improve the overall impact and effectiveness of work need to build on and respect this rather than replace it
- a combined approach using social marketing strategically to inform intervention selection and operationally to target particular behaviour has the potential to achieve the greatest benefit.

Food Dudes

Bangor Food Research Unit at the School of Psychology, University of Wales Bangor, 1992 to present

Initiative to promote healthy eating in children

Greatly increased and sustained the quantity and range of fruit and vegetables consumed by children, especially those who ate least at the outset. Two projects found:
- children in a school in Brixton more than doubled their lunchtime consumption of fruit
- children in a school in Salford tripled their lunchtime consumption of vegetables.

www.fooddudes.co.uk

"It's simple, social marketing works if you put the time and effort into doing it properly. It helps you get the best value from the resources you have."

Ray Lowry – Newcastle PCT

In more detail:

- when the core concepts and principles of social marketing are applied systematically they can significantly improve the impact and effectiveness of work, whether at local, national or international level
- social marketing has potential to support achievement of specific behavioural goals across a diverse range of issues and topics. While social marketing has a developing history in the health sector, it is also increasingly being used in other areas such as sustainability and community safety
- social marketing can help to achieve behavioural goals and directly support service development and redesign by ensuring that they respond to, and meet the needs of, their intended audiences or consumers
- understanding of social marketing can vary between and within different professional and other stakeholder groups. In some instances there are clear misunderstandings and confusions about what the theoretical and practical base of social marketing involves. This could lead to possible resistance
- once social marketing is properly understood, there is wide ranging interest in learning about it, and finding ways to use and apply it across different issues and topics
- the eight key features identified in the *social marketing benchmark criteria*, developed as part of the review, appear to be the most critical aspects of social marketing (see page 42)
- as yet there are no common and consistently used core standards for social marketing. Understanding and use of the *social marketing benchmark criteria* is only at a very early stage
- social marketing can support efforts to achieve an appropriate and effective balance between the role of individuals, and the role of the state and relevant bodies
- the drive to identify and capture what constitutes best evidence-based practice remains key, and it is clear that much useful experience and learning has yet to reach formal literature. Active review, evaluation and capturing of learning is central to expanding the evidence-base, improving impact and effectiveness, and cost-effectiveness
- use of social marketing is limited in the UK and has yet to be integrated properly into academic and professional training and practice. Therefore, current capacity in this area is under developed
- national media campaigns can be a valuable component of a wider social marketing programme approach. However, if they are undertaken in isolation evidence indicates that they have little impact on people's behaviour other than in very limited context. A greater impact is possible when new information can be identified as the central or key influencing factor for a behaviour
- the review identified a widely held view among policy-makers and communications practitioners, supported by growing evidence-based literature, that for national media campaigns to achieve specific aims using paid media there is a threshold, or critical mass that needs to be addressed in terms of resourcing
- the review identified that many comparable countries such as Canada, US, Australia and New Zealand, are ahead of England in using social marketing and in developing practitioner skills and experience. However, no country had a clear strategic social marketing approach to inform and steer their overall health strategy. This means that there is real potential for the UK to lead and pioneer such an approach.

The findings
Finding 2

We considered the extent to which:

- a social marketing approach could increase the effective use and mobilisation of resources and assets.

Finding 2: There is potential to use available resources and mobilise assets more effectively

In short we found:

- overall, England has many resources and assets that provide a very positive context for the promotion of health
- there are real pressures on public health and health improvement-related funding at national and local levels that appear to be impacting on the intervention options and approaches considered
- social marketing's concern with achieving tangible and measurable behavioural goals, alongside its active consideration of intervention and marketing mix issues, provides a valuable framework to ensure available resources and assets are used to greatest effect
- the issues of threshold and critical mass appear to be important when considering the resource levels allocated to different intervention methods. Valuable resources can be wasted if they are below the level where impact is possible or likely.

Giving up smoking

University of Newcastle, April 2002 to present

Social marketing stop smoking programme aimed at pregnant women in Sunderland:

- 10-fold increase increase in the uptake of stop smoking services by pregnant and non-pregnant smokers*
- setting a quit date and quitting while pregnant was high when compared with PCTs without a stop smoking programme*.

*between April and June 2002

r.j.lowry@ncl.ac.uk

In more detail:

- the value of social marketing is not dependent on the level of available resources

- there is significant potential to use existing resources more effectively. Key to this is:

  – greater prioritisation and focus on a limited number of core priorities
  – adopting active disinvestment strategies, and stopping doing what does not work or cannot achieve the required impact
  – applying social marketing principles more systematically across all work programmes and campaigns to build greater consistency.

- developing a clear and sustainable investment strategy for health promotion based on social marketing principles could enhance impact and effectiveness

- developing a standardised system for budgets informed by what is known about the scale of the core challenges, and the evidence of the effectiveness or experience about the delivery of health programmes nationally and internationally. Budget allocation for specific programmes such as tobacco and sexual health have been informed by evidence and international comparison

- many budgets for health promotion programmes are allocated on a fixed amount and fixed-time basis. It is probable that many current budgets are insufficient to demonstrate a health impact

- the review could not identify a standardised accounting mechanism to track the impact and return on investment of health promotion budgets across the DH or the NHS

- the systematic evaluation of practices and the initial economic modelling carried out in this review indicate that it is probable the scale of health promotion resourcing in many key priority areas needs to be increased to achieve agreed PSA (public service agreements) and *Choosing health* targets. This evidence also indicates that health promotion programmes could be more effective if further restrictions were applied to the promotion of unhealthy products through agreement and or legislation

- many countries have developed substantial health promotion budgets with the introduction of levies or specific taxes on products such as tobacco, insurance schemes, co-funding arrangements with the private sector and philanthropic foundations, or per capita funding formulas. There is potential to develop similar schemes in England. However, this will first require a thorough examination of such schemes, which was outside of the remit of this review.

The findings
Finding 3

We considered the extent to which:

- there was recognition and appreciation of the limitations of existing public health and health communications approaches, and commitment to making changes
- issues affecting the current approaches, systems and structures, and how these might be built on and enhanced.

Finding 3: Current approaches are unlikely to deliver the required policy goals, leadership and effective co-ordination are key to success

In short we found:

- there is valuable high level understanding and ownership among ministers and senior civil servants of the importance of social marketing, and its potential to drive improvements in health promotion. This provides a confidence that if key recommendations are adopted and acted on, significant improvements can be achieved in England
- there is wide ranging support for the view that to continue to use existing methods and approaches would be unlikely to achieve the changes in people's behaviour required by relevant policy and related targets
- a key problem identified by DH is that it is still trying to deliver the full programme of work set in motion prior to the reduction in civil service staffing. DH has not achieved a move towards a strategic and expert commissioning role, and the associated reduction in direct in-house delivery
- DH staff across policy, programmes, communications and research have a wide range of skills and experience. However, even highly skilled staff are struggling to deliver the type of impacts on key behaviour that the policy aims and targets require
- co-ordination within DH, and between government departments, presents real challenges. While there are indications that linking up consumer research between departments, for example, could improve cost-effective use of resources, in practice co-ordination is an issue that is not yet resolved
- the commissioning process of health-related programmes and campaigns should be clarified and streamlined. This includes the role and services available to DH from the COI (Central Office of Information)
- across the wider public health system from local to district levels, there are clear pockets of enthusiastic leadership and willingness to integrate learning from social marketing.

SunSmart

New Zealand government. Run by the Health Sponsorship Council and the Cancer Society of NZ, 1993 to present

Programme to increase the use of sun protection among children under 12 years old and their care-givers

Achieved increased uptake of sun protective behaviours:

- in 1994, 32% of respondents reported use of sunscreen in the weekend prior to interview – in 2005/6 this had risen to 49%
- in 1994, 49% of respondents reported that they had never been burnt – in 2005/6 this figure was 61%

www.sunsmart.org.nz

In more detail:

- there is national high level appreciation of the need to review and adjust methods and approaches in order to achieve improved impact and effectiveness of health promotion campaigns

- there is recognition that the Health Secretary and the Minister for Public Health have key championing roles, in ensuring the effective development and delivery of health-related programmes and campaigns

- it was not possible to identify a uniform operating approach for working with ministers to maximise the value of their contribution

- the breadth of experience and skills of DH staff across policy, communications and research represents a major asset, although levels of understanding and application of social marketing currently vary

- the review found that even experienced and skilled staff sometimes struggled to deliver challenging targets that have complex behavioural goals. The key reasons are summarised in the box below.

breadth of priorities
staff were being asked to address a range of tasks that lacked unambiguous priorities

the level of policy and organisational change in recent years
even where changes were seen as positive, adjusting to them limited the time available to develop and deliver work

inherent pressure toward immediate and short-term solutions
although an understandable political reality, in practice acts to limit the ability of staff to plan for the medium and long-term

attempts to maintain existing approaches based on previous higher staff resourcing levels
DH staff were, in some instances, struggling to delivery a broadly similar level of work with significantly reduced human resources. A common, but expensive and probably unsustainable solution, has been to use consultants and contractor-supplied staff

difficulties in achieving genuine cross-departmental working
despite recognition of the value of cross-departmental working, the complexity of joining up work across disciplinary and departmental boundaries was difficult in practice. Where this did occur it appeared to be to the individual credit of staff who had made conscious and concerted efforts to achieve it

genuine difficulties in linking national and local work
the complexity of mobilising action across the wider public health system presents significant challenges. While there were some examples where the link between national and local development and delivery worked well, this was not usually the case.

Finding 3

- there is real potential to improve co-ordination within DH and with other government departments. But potential opportunities to achieve greater synergy and shared learning are being missed because it is a complex issue. At times different policy areas compete with each other for the attention of a given audience, rather than co-ordinating action together
- while DH is working to improve internal co-ordination, there is a tendency to become entrenched in particular policies and topics that limits the potential for wider shared learning
- the review identified a number of good examples of partnership marketing that have been developed by DH, which demonstrate the value of co-delivery with suitable partner organisations and sectors
- DH has at least six commissioning and programme development approaches. These approaches involve the COI, the Media Centre, the DH campaigns and policy teams, and a mix of agencies. There are differing views about the value that is added by COI, and the most efficient and effective way to commission and develop programmes and campaigns
- the role of regional directors of public health and the public health leads in strategic health authorities can be critical to the successful roll out and co-ordination of activity from national to local level. There is potential for regional public health staff and strategic health authorities to provide an important bridge between national and local work, in particular to inform and feed in key intelligence and insights.

Spreading the word about mouth cancer

NHS Scotland, 2002 to 2005

Social marketing project to encourage 'at risk' groups to go to the doctor earlier if they had signs and symptoms of mouth cancer:

- achieved 185% increase in the number of suspicious lesions that were referred to Glasgow Dental Hospital. This remained at almost double long after the campaign had ended
- almost 70% of those who went for mouth cancer treatment were the direct result of the campaign.

www.woscap.co.uk

Finding 4

We considered the extent to which:

- existing capacity, capability and skills could be built on, strengthened and enhanced for greater effect.

Finding 4: Social marketing capacity and capability across the wider public health system is currently under-developed

In short we found:

- current capacity and capability in social marketing is still at a relatively early stage. There is, however, a lot of experience and related skills that can be drawn on to provide a good base for further developments. Public health, health promotion and health communications all provide valuable experience and skills to build on
- different sectors are moving forward at different rates. As various organisations begin to establish their social marketing approaches and portfolios, there is potential for different and inconsistent approaches to undermine the ability to assess the impact of work and to capture and share learning effectively
- social marketing has yet to be properly integrated into academic and professional training and practice, and therefore current capacity in this area is limited.

Finding 4

In more detail:

- compared to many other countries, England has a comparatively well-developed and dynamic public sector infrastructure (including public health). While there is a sound foundation, there is limited direct social marketing capacity and skills

- disciplines such as public health, health promotion, health communications and research all have critically important contributions to make, but as yet do not routinely incorporate social marketing in relevant academic or professional training

- the academic sector, in particular, is under-developed in relation to social marketing. It has very few dedicated courses and very limited modular content on social marketing as part of other marketing, communications, or public health courses. Nevertheless, there is a growing core of academics increasingly keen to develop and expand capacity in this area that could be built on in the future

- the private sector is beginning to respond to the need for social marketing. There is a growing range of commercial companies that describe and position themselves as social marketing agencies. However, what is presented as social marketing can vary significantly, which can create difficulties for those commissioning work

- while the dedicated public health and health promotion sectors already use many of the core concepts and principles of social marketing, they are not as yet applying them systematically

- social marketing capacity and capability is limited at government department level, and across national agencies, Nevertheless, a number of departments and agencies have been using social marketing to varying degrees. This includes DEFRA (Department for the Environment, Food, and Rural Affairs) and DfID (Department for International Development), which have been using it over a number of years. The government's recent strategic communications work *Engage*, led by the Cabinet Office is grounded in a common core set of social marketing principles. This will add additional impetus and drive to improve the impact and effectiveness of their work programmes

- further development of co-delivery and multi-sector working offers potential to enhance the reach and effectiveness of health promotion, and mobilise assets as yet not being fully realised or engaged

- there are a growing number of examples of multi-sector working between statutory and voluntary, or non-governmental sectors that provides a good basis to build on. The NGO sector's closeness to key audiences and consumers means that they often have important understanding and insights when they plan interventions, particularly where segmentation options are being considered

- co-delivery of work with the commercial or private sector appears relatively limited. There may be a number of reasons for this that merit further examination. For example, during the review it was evident that there is a tendency for the commercial sector to be perceived as a problem, rather than as a potential asset. If this can be addressed there could be significant interest from the commercial sector to build more constructive relationships with the public sector. The commercial sector could provide a valuable set of additional skills, expertise and insights that, if managed effectively, could strengthen the reach, impact and effectiveness of programmes and campaigns.

Finding 5

We considered the extent to which:

- existing research and evaluation could be built on, but also reframed, to achieve a greater focus on achieving behavioural outcomes.

Finding 5: The importance of integrating effective research and evaluation into the development of programmes and campaigns to maximise its value

In short we found:

- while research and evaluation occurred across programmes and campaigns in one form or another, there is as yet no single unambiguous and commonly-applied approach in use
- there is potential to improve review and evaluation to increase impact on key behavioural goals
- field practitioners are keen to have better access to key research and evaluation from national campaigns so that they can consider how this can inform their own work, and reinforce links and connections.

In more detail:

- a wide range of market research techniques and data sources can assist in scoping and evaluation, but they are not always used effectively. For example:
  - government departments commission a great deal of audience research that, even within a department, may not be fully used
  - there is significant potential to improve links with the commercial, NGO and community sectors. All of these sectors have important understanding and insight into consumers that is not, as yet, being fully utilised.
- the current focus of research and evaluation approaches is not always consistent and linked to measuring tangible impacts on behaviour
- further work to develop a common understanding and approach to establish appropriate behavioural goals for programmes and campaigns will assist development and support effective assessment of impact
- the DH approach to gathering and assessing international evidence and experience prior to the launch of new programmes varies from campaign to campaign, and there are many examples of good practice. However, field practitioners are not always kept informed, and there is no standard system to make this information and intelligence readily available. The recent move to disseminate campaign reviews is a good example of how to improve this situation

Finding 5

- current programme and campaign evaluation tends to focus on short-term impact measures including awareness and recognition measurement. This form of tracking evaluation is vitally important to help shape interventions and give early feedback on success. Other evaluation measures look at establishing a new service or setting up new interventions by a certain date. There is also evidence to suggest that some efforts are made to track behaviour change against targets. For example, the four-week smoking quit rate is directly linked to agreed strategic targets. However, due to methodological and resources issues, measuring behavioural impacts for the majority of DH-led health programmes is currently less well developed

- review research indicates that campaigns that are grounded in a good understanding of the customer, intensive, sustained, specifically targeted and delivered through a mixed marketing approach with strong local support are most likely to raise awareness levels, influence attitudes and achieve behavioural goals

- evidence indicates that the UK, and England in particular, is noticeably under-represented in published literature. We found few examples of published reviews and evaluations of programmes and campaigns consistent with social marketing. This is despite the fact that there are many examples of such work at national and local levels. This indicates that, unlike some other countries, we have not as yet established a culture where all practitioners routinely produce an intervention summary report and related articles for publication. This means that a great deal of valuable experience and learning remains outside the formal literature

- the potential to develop joint evaluation between different health campaigns and programmes, particularly where target groups and issues overlap, is not yet being realised

- the range of commercially available market research data is not well integrated with demographic and epidemiological data. The importance of such data is not well understood, and there is insufficient data being gathered and shared within departments and with other agencies

- responsibilities for research, development, evaluation and market research varies, and they are not always clear within departments and between agencies

- methods of capturing evidence about what works, and why, are narrowly defined and this limits the development of good intelligence and insight

- there are some good examples from front line practitioners of intelligence gathering systems about people's needs and the impact of current health promotion interventions. However, there is room to develop a more systematic approach to intelligence collection. During our review, local practitioners often expressed a desire for DH policy leads to increase the level of briefing on national programmes and campaigns, particularly about the research base. They wanted opportunities to input potentially valuable local learning and good practice

- there is evidence of targeting in most campaigns in terms of demographic and epidemiological criteria, and with clearly defined audience and risk groups. Audience research has been used to good effect in revealing typologies that help in segmentation. However, the subtle distinctions made in marketing between population categories, by using psychographic data to understand motivations and barriers, is less evident, and less commonly translated into campaigns or programme delivery

- understanding of research methods, statistical significance and the issue of attributing observed changes in population knowledge, attitudes and behaviour to particular interventions varies from campaign to campaign.

3. The recommendations

Framework for the first National Social Marketing Strategy for Health

Introduction, and benefits
Aims and objectives
Organisational delivery and support
What success would look like – national three-year review checklist

Recommendation to adopt a strategic social marketing approach

In light of our findings, we recommend that the Government, and the Department of Health in particular, adopt the following National Social Marketing Strategy for Health. It focuses on building capacity and skills to ensure all national and local programmes and campaigns use a consistent social marketing approach to enhance their impact and effectiveness.

Introduction

The strategy we set out here is based on a long-term strategic social marketing approach for the DH and the NHS to adopt and use to steer their work to achieve specific health-related behavioural goals.

The approach builds on government policy and has the potential to assist:

- individual and community consumer-focused action and support
- efforts to address wider influences and other health determinants.

The strategy is challenging but deliverable. It provides a framework for implementing social marketing systematically across health promotion and improvement programmes. It does not highlight specific health issues that need to be addressed. These have already been agreed and set out in key government health and health-related policy papers. It does, however, highlight the importance of achieving greater prioritisation in the broad sweep of government priorities.

While this strategy recommends some fundamental changes to the way that the DH leads health improvement, it is not a detailed change management programme. If the recommendations set out in this report are accepted, a managed change programme will be needed to ensure a smooth transfer from the current approach.

The exchange for DH to consider

The DH needs to consider the costs and benefits of the recommendations. Using social marketing theory, the exchange that is on the table relates to the costs of adopting the strategy versus the benefits. This statement of cost and benefits overleaf makes a powerful case for adopting the recommended action.

The recommendations

Structure and rationale for this section

The recommendations are set out as five key strategic objectives which link to the five areas identified in the findings section.

Each of the strategic objectives is followed by a range of operational objectives. They provide some practical first steps for implementing a more consumer-focused approach to improved health promotion in England.

However, it should be noted, at the specific request of the DH, they do not at this time:

- include a detailed timetable
- set out specific details of how recommendations should be delivered.

This is because DH has advised us that the pace and capacity to take forward the strategy requires their further consideration. The business of deciding which recommendations are progressed and how best to deliver them is, rightly, the responsibility of the DH.

A three-year checklist to help DH and others assess the extent to which they have been able to implement the strategy successfully is included on page 38.

Costs of adopting a strategic social marketing approach

- Loss of the quick fix. The need to move away from using rapidly developed health campaigns as a way of demonstrating that something is being done, rather than the development of campaigns that form part of well-researched and long-term behaviour change strategy
- Loss of the perception of total control. The cost of building an understanding that the Government has an enabling and key leadership role, rather than total responsibility for promoting health. This cost includes the need for the Government to acknowledge this position and defend it
- Cost of investing in preparation. This cost involves the need to invest in thorough research, scoping and pre-testing interventions before launch. This cost also means moving towards longer term planning and delivery
- Cost of being accused of abdicating responsibility and building delivery alliances with the private sector that will not serve the best interests of public health. This cost includes explaining and defending the need to build strong partnerships with the private sector to promote health. At the same time the public must be protected from the negative impacts on health of actions by the private sector
- Cost of investing in co-ordination. The need to invest resources in joining up government action, and building and maintaining strong partnerships with communities, professionals, and the NGO and private sectors.

Benefits of adopting a strategic social marketing approach

- Improved overall impact and effectiveness of national programmes and campaigns that includes an increased return on investment. There are also savings gained from stopping ineffective or counter productive interventions
- Better understanding of health needs and workable solutions – increased understanding and responsiveness to people's health needs and a strengthened focus on achieving specific, tangible and measurable behavioural goals
- Effective prioritisation of health improvement programmes – clearer targeting of interventions based on a sound understanding of what is most likely to impact and influence people's behaviour
- Clearer understanding of the balance between individual and state actions needed to improve health
- Simplified and de-layering of the delivery system of health improvement programmes, strengthening co-ordination, and clarifying roles and responsibilities between national and local levels
- Greater use of skills and expertise and resources from across all sectors, and maximising expertise from the private and NGO sectors
- Enhancing evaluation and sharing of learning within and between programmes.

The recommendations
Aims and objectives

The following represents a framework for the proposed *National Social Marketing Strategy for Health*. It sets out a high-level strategic aim, and five objectives for the Department of Health to adopt, and is followed by more detailed operational objectives.

National Social Marketing Strategy for Health

Strategic aim
Increase the impact and effectiveness of health-related programmes and campaigns at national and local levels, by ensuring that social marketing principles are adopted and systematically applied

Strategic objectives

1. Achieve an enhanced consumer-focused approach based on social marketing principles and practice that puts the consumer at the centre of all development and delivery work
2. Increase the effective use of resources, and their overall impact, by better mobilising available assets and developing a diverse resource base
3. Enhance DH leadership, prioritisation and development of its expert commissioning role
4. Build capacity and skills to integrate social marketing within existing strategies and interventions at national and local level
5. Reconfigure research and evaluation approaches to ensure movement towards behavioural goals can be assessed, and to systematically capture and share learning.

The recommendations
Strategic objective 1

Strategic objective 1
Achieve an enhanced consumer-focused approach based on best social marketing principles and practice that puts the consumer at centre of all development and delivery work

Operational principles

- Use a consistent set of consumer-focused social marketing principles and concepts across all national programmes and campaigns, using the *social marketing benchmark criteria*
- Use a common core process for development of all programmes and campaigns, using the *social marketing total process planning model* with a strong focus on the initial *scoping stage*
- Actively capture and share learning by producing reports on all work
- Mental and emotional health integrated across all future programme and campaign interventions, and not just as a dedicated mental health programme.

Operational objectives

- **Apply *social marketing benchmark criteria* to all national programmes and campaigns to guide and steer their development directly**
  In particular these should be used to develop the new national mental health and *Fitter Britain* campaigns announced in *Our health, our care, our say*. These interventions should be developed as long-term social marketing programmes. Outside of the dedicated mental health programme, mental and emotional health and physical wellbeing should be integrated as key features of all programmes and campaigns.

- **Apply a standardised scoping stage to all national and local programmes and campaigns**
  A standardised scoping stage will ensure that the consumer view is considered together with analysis of intervention options and the most effective balance, or mix, to achieve the greatest potential impact. Producing a scoping report will ensure that all practitioners are able to access information, and the assumptions being used to guide subsequent development work. The report will clarify the initial behavioural focus and goals. Scoping reports should be produced for all commissioned work and should subsequently be used to inform evaluation.

- **Produce a scoping report for each of the eight national health priorities in *Choosing health***
  To assist integration and links between national and local development of programmes and campaigns, and to ensure the premise for their development is clear. These reports should follow a consistent approach.

- **Establish clear stakeholder strategies as a key component of a formal scoping stage. With specific multi-sector stakeholder groups as part of all national programmes and campaigns**
  Stakeholder strategies should examine and clarify appropriate engagement with the NHS, local authorities, NGO, commercial sectors, and key professional associations. Groups should involve experts and consumers affected by the issue, so that they can work together to clarify understanding of the problem and to discuss potential solutions. This work

> **"If we put social marketing into practice we will have a real chance of achieving the challenging PSA targets we have to work on"**
>
> **Fiona Adshead – Deputy Chief Medical Officer**

should build on and integrate with existing community, consumer and patient groups and initiatives, rather than create new structures. The groups should act as sub-groups to the new national reference group for health and wellbeing.

- **Adopt a consumer-value branding strategy for all national programmes and campaigns**
  This should articulate the relationship between organisational brands (the message giver) and topic or campaign branding. While there are clear benefits in promoting the NHS more widely as a health message giver brand, this should only be done where there is direct evidence that the intended target audience would be likely to value and appreciate messages and interventions coming from the NHS. Where this might be unclear, or where there is evidence that it could impede communications and engagement, alternative approaches should be considered and a rationale for this clearly established.

- **Undertake further work to determine the potential value of establishing potential iconic brands**
  To assist with coherence of longer-term health programme communications such as tackling obesity and exercise promotion.

- **Continuing the selective use of key partner agencies**
  To front specific campaigns and interventions where there is good evidence that the authority and image of the partner will enhance impact.

- **Establish a set of clear core scripts for each national programme and campaign which can be readily communicated to field practitioners, to assist development of consistent messaging in key areas**
  Core scripts should allow everyone working on priority programmes to be 'on message'. They would represent a DH quality assurance scheme for health messages and information. Core scripts could be actively promoted for use by any public, private or NGO sector organisation to spread quality-assured health information and messages. They should be used by all DH-sponsored new media services, such as web sites, as the basis for advice to the public on health promotion issues. They should also be developed for all priority segments of the population. The concept of 'message bundling', for example combining messages focused on sexual health and alcohol consumption, should be explored as a mechanism for creating a more consumer-focused approach to providing health information, and achieving and sustaining behaviour change.

- **Commission a specific review focused on using social marketing for tackling health inequalities**
  This review should draw together the published literature on how social marketing has been used to tackle health inequality and other forms of disadvantage, together with practical examples of national and local interventions that may not have been formally published in peer reviewed journals.

Truth

The American Legacy Foundation, February 2000 to present

National anti-smoking education campaign targeting 12 to 17-year-olds, after two years:

- 75% of all young people were able to describe one or more of the Truth ads accurately
- young people aware of the Truth campaign were 66% more likely to say that they would not smoke in the coming year
- smoking in teenagers reduced in the US from 25.3% to 18%. Truth accounts for around 22% of the decrease.

www.protectthetruth.org

The recommendations
Strategic objective 2

Strategic objective 2
Increase the effective use of resources and their overall impact by better mobilising available assets and developing a diverse resource base

Operational principles

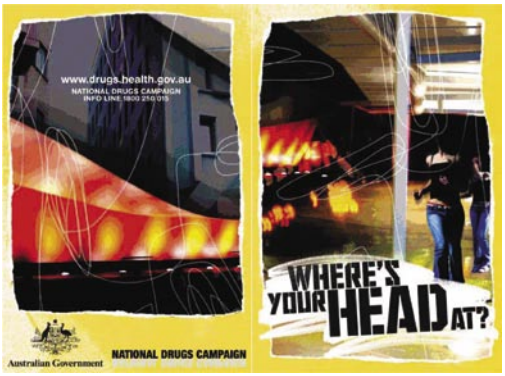
- Adopt a mission-driven and evidence-based budget approach that reflects the resources needed to achieve programme goals
- Adopt a system of longer-term planning and budget allocation that includes return on investment analysis
- Enhance effective working between the public and private sector
- Use co-funding and co-resourcing arrangements for interventions across the public sector and with the private and NGO sectors.

Operational objectives

- **Establish an active disinvestment strategy**
  The strategy is necessary to both refocus DH effort on strategic commissioning and systematically exit from direct in-house delivery wherever possible, and to discontinue non-priority activity. As part of its prioritisation process DH should develop criteria for disinvestment together with those for selecting priority areas.

- **Produce an investment model and budget decision aid as part of the review of public health spending recommendation in *Our health, our care, our say***
  The model should aim to determine the necessary resources needed to achieve agreed *Choosing health*-related behaviour goals and Public Service Agreement (PSA) targets. It should include an appraisal of international funding models, actual and possible contribution from other sectors (including the private and NGO sectors), and a decision aid to facilitate future investment decisions. It should build on the economic cost and investment modelling report developed as part of this review.

- **Review and establish a mechanism to facilitate cross-government discussion and co-ordination of national public campaigns and related programmes**
  To assist:
  a) improved co-ordination of government national campaigns between different departments, particularly considering issues related to scheduling work and its potential impact on similar target audiences
  b) share developing consumer insights and learning in relation to effective methods and approaches. This includes continuing to develop a close working relationship, and where possible a joint work programme, with the *Engage* strategic communications work across government lead by the Cabinet Office.



Where's your head at?

Australian government. Phase one March 2001 and phase two April 2005

Programme to reduce the proportion of young Australians using illicit drugs:

- 41% of parents reported that the campaign had prompted them to take some action, including talking with their child about drugs (81%) (31% of all parents)
- 65% of young people reported that the campaign had influenced them. The most common influence was avoiding using drugs (36%).

www.drugs.health.gov.au

- **Review and establish a mechanism to facilitate greater internal DH co-ordination of national health-related programmes and campaigns**
  There would be a strong case for establishing a social marketing Programme Board consisting of all relevant senior DH stakeholders to act as the co-ordinating body for all health-related programmes and campaigns. Such a mechanism could be supported by a number of project teams covering agreed priorities, who would report to the social marketing Programme Board

- **Establish a forward e-calendar of health-related programmes, campaigns, and related events**
  The calendar should be available to the public and be widely promoted to all communications, public health and other relevant professions and groups. It should provide advance notice and reminders for local practitioners and also act as a one-stop centre for anyone wanting to know what is being planned and delivered, and how they can make a contribution to it. This new service should also provide a mechanism for contributing views and examples of practice from local work.

- **Develop guidance on how private sector organisations and NGOs can support government-led social marketing interventions**
  This should set out practical rules of engagement to guide development and management of partnerships. It should also include advice on different forms of partnership and related governance issues. As part of this initiative, DH should establish a volunteer programme and agreement framework that allows voluntary and commercial sectors to support DH-commissioned social marketing programmes and campaigns. The agreement framework would allow organisations to volunteer time, expertise, research capacity, data, paid-for media time, interactive web-based service access, direct audience access and funds to support the development and implementation of DH priority programmes. DH would seek volunteers for each of its programmes to assist in the development and delivery planning and implementation. Clear guidelines should be developed to protect the integrity of programme aims and objectives.

- **Move towards a system of mission-driven budgeting for the 2007/08 planning round**
  For 2007/08 all central budgets should be allocated following a clear prioritisation process using criteria that assess plans and proposed budgets against expected return on investment in terms of achieving specific behavioural goals. Budgets should be developed on the basis of a plausible intervention strategy that can demonstrate a contribution to behavioural goals. Budgets should be allocated over more than one year to facilitate better medium to longer-term strategy development, delivery and evaluation.

- **Ensure PCT funding for health promotion is ring-fenced or subject to separate reporting via local directors of public health**
  As indicated in *Our health, our care, our say*, PCTs (primary care trusts) should also be required to report explicitly on the application and impact of their *Choosing health* allocation as part of their annual appraisal. A review of these appraisals should be conducted and made publicly available. A key principle should be to ensure that investment can be more clearly identified and tracked.

- **Establish written agreements with all government departments that lead or contribute to health-related communications and related behavioural interventions**
  These agreements should set out how departments will co-ordinate their efforts and how funds allocated to projects of mutual concern will be used to maximum effect. Agreements should also be developed with key government agencies, including the Health Protection Agency, the Big Lottery Fund and the Food Standards Agency.

The recommendations
Strategic objective 3

Strategic objective 3
Enhance DH leadership, prioritisation and development of expert commissioning roles

Operational principles

- Prioritise effective co-ordination of action and support across government
- Adopt a clear expert commissioning role across the DH. To add value by 'only doing that which only DH can do'. Focus on: policy development and support; programme prioritisation; strategic development and intervention option selection; co-ordination and review and evaluation
- Effective prioritisation to drive all efforts by using theory and best available evidence
- Inform and involve all key practitioners and stakeholders proactively. This is integral to the development process and not an add on.

Operational objectives

- **Adopt a clear aim and set of objectives for a new *National Social Marketing Strategy for Health* that is consistent with the recommendations in this report, and which can be readily communicated to internal and external stakeholders**
  Set out a clear aim for the strategy with measurable objectives that can directly guide its development and related commissioning work, and help facilitate effective ongoing review and evaluation. Make these readily accessible via the DH and NSM Centre websites so that all relevant stakeholders can clearly access and understand what the strategy is seeking to achieve.

- **Establish a specific planned management of change programme to implement the new strategy across the DH and NHS**
  Use the NHS Institute's eight-step guidance on handling successful change to develop a specific change-management programme.

- **Undertake a formal review in 2009**
  To assess the extent to which social marketing has been integrated into national programmes and campaigns as a result of the new strategy (see page 38).

- **Ensure the DH business operating model focuses on its core roles of policy, strategy development, and related expert commissioning, and actively reduces direct in-house delivery of work**
  This should mean a move away from undertaking operational development and direct management of health-related programmes and campaigns. In addition to staff capacity considerations, expert commissioning is a key priority to ensure greater consistency and co-ordination across health-related programme and campaign commissioning. Whatever structures DH adopts to achieve this it should ensure that all commissioning is directly based on the *social marketing benchmark criteria*. While exceptions may occasionally be required, the standard operating principle should be for all commissioned programmes and campaigns to be managed and delivered outside the Department of Health.

- **Review and establish clear mechanisms for increased and explicit prioritisation of DH health promotion plans**
  Explicit criteria should be developed that are consistent with the principles of *Choosing health* and *Our health, our care, our say*. The criteria should also be informed by what is known about effective practice and the size and seriousness of health challenges. DH should establish an agreement with all policy leads and sponsors across the department that all social marketing programmes and campaigns led by DH and its agencies will be subject to a collective prioritisation and budget allocation process. This should include discussions and agreement with the key sponsors such as the Chief Medical Officer, the Chief Nursing officer, the Chief Pharmacist and Chief Dentist. This agreement should also be extended to include key NGOs and other public health organisations that are responsible for delivering campaigns, health information and behavioural programmes on behalf of DH. The review should examine what is known about levels of investment needed to achieve desired programme goals. This review should be used to inform ongoing Comprehensive Spending Reviews.

- **Establish a standardised social marketing planning system based on the social marketing *total process planning model* and related *benchmark criteria***
  All future plans should state explicitly their behavioural goals and how these will be measured and tracked. Ministers should be provided with a review of all plans to demonstrate that they meet standard criteria for planning and delivery. A national programmes and campaigns report and publications schedule should be established.

- **Produce summary review reports for every national programme and campaign, and establish a specific publications strategy to ensure all work is presented to relevant academic and research journals for potential publication as a standard operating principle**
  The reports should follow an agreed standard format, setting out clearly the rationale and research informing the work; what was undertaken; and relevant review and evaluation data.

- **Review and establish a new service level agreement (SLA) between DH and COI to maximise the contribution of the COI service to DH**
  A new SLA should be agreed that clearly sets out the role of both the DH and COI. The SLA should also include a consistent model of engagement that sets out how the DH will engage the COI, and what services will be delivered, at what cost and to what quality standards. The development of a new SLA should also be taken as an opportunity to clarify a longer term vision of how the DH and COI will develop their relationship into the medium and longer term.

- **Ensure consistent use of social marketing across COI**
  DH should work with COI to ensure that a consistent social marketing approach is applied to the development of all new programmes and campaigns, research and evaluation projects delivered for DH. The models developed should be consistent with the standardised planning systems and quality criteria that will be applied by DH to the development and commissioning of future campaigns and programmes.

- **Invest in developing expertise and understanding about the strategic application of new information technologies for health-focused social marketing**
  DH should commission a specialist agency to report on examples of how central government has used new media from the NHS, local authorities and internationally. The review should encompass the private sector's use of new media to promote health and health-related issues.

- **Ensure effective engagement of ministers in the development of programmes and campaigns, particularly at the scoping stage**
  Ministerial roles are crucial as champions for effective approaches and strategies. It is key that there is effective planning and work scheduling to ensure that there is clarity about what ministers need to sign-off and when this will occur. DH needs to ensure that there are simple and effective systems in place for tracking and co-ordinating the development of programmes and campaigns. It should also be clear when and how a minister will be part of the process. DH should provide ministers with practical tools and checklists to help them effectively champion, drive and monitor the DH in acting as expert commissioners, and overall programme and campaign development.

- **Ensure the effective use of external consultants and short-term contractors where there is a clear rationale for using their specialist skills and knowledge**
  There is a need to co-ordinate the appointment and use of consultants and to monitor their costs and contribution in a more systematic way.

The recommendations
Strategic objective 4

Strategic objective 4
Build capacity and skills to integrate social marketing within existing strategies and interventions at national and local level.

Operational principles

- Build staff and practitioner capacity and skills
- Foster the growth of dedicated academic and research capacity
- Work with professional associations to support and champion the development of best practice and integrating social marketing understanding and skills in their work
- Build greater understanding and skills in social marketing at national and local levels
- Develop practical learning resources to assist relevant local and national leaders and practitioners
- Ensure all future interventions are built on principles of co-delivery
- Build strong partnerships across the public sector with the private and not-for-profit sectors.

Operational objectives

- **Confirm a three-year work programme with the National Social Marketing Centre, and formally launch the Centre as part of response to the review**
  Review governance arrangements and initiate work to examine potential options for developing a mixed resourcing base. Launch the National Social Marketing Centre formally as fulfilment of the government's *Choosing health* commitment to appoint an independent body to champion the development of social marketing in England. It is proposed that the Centre remains located at the National Consumer Council for at least a further period of three years to ensure that initial work can be capitalised on and impetus sustained. During this period it is recommended that work is undertaken to examine the feasibility of transforming the Centre into a not-for-profit social foundation supported by a mixed resourcing base.

- **Further develop a national training programme of social marketing seminars and conferences**
  Provide an ongoing range of social marketing training and development opportunities to increase understanding and develop practical skills in social marketing.

- **Provide PCTs and SHAs with practical hands-on support in developing local social marketing interventions and link them to national programmes**
  DH should capitalise on the initial work to establish a social marketing network of champions at PCT and local authority level to develop and spread

> **"Looking into social marketing we quickly realised that there were practical things we could learn that could really improve what we do."**
>
> **Diane Forrest – Director of Public Health, Knowsley PCT**

good practice. Initial support should be provided free to PCTs for the first three years, with a review to examine ways that ongoing support might be delivered via a not-for-profit payment service.

- **Establish a new public health partnership service similar to that of the CDC Foundation (Centre for Disease Control in the USA)**
  The aim of this is to build partnerships with the private sector. It would provide co-ordination and leadership for the development of partnership agreements, co-delivery, sponsorship and other forms of corporate support and joint projects at national and local level. The service would also work to capture and disseminate examples of good practice, maintain an active network of partners and highlight DH and NHS teams that want partners and support. It should be located outside DH so that DH can maintain its strategic and impartial status.

- **Launch up to ten local social marketing champion sites with particular focus on key Spearhead priority areas**
  These sites should act as champions and learning hubs to develop and spread good practice, and as live demonstration sites for the rest of the country. It is proposed that these should be generated from local interest and operate within the existing local resource base – that is, not generated through special additional funding from the centre. They should have access to hands-on support to help them invest local resources in social marketing interventions directed at addressing key health promotion priorities. The aim of this scheme would be to demonstrate that the application of social marketing using local resources can create measurable improvements in health-related behavioural goals.

- **Develop a number of practical resources that include a specific social marketing planning guide and a guide on how to evaluate and report findings**
  These guides should contain real life examples and be circulated to all relevant practitioners. They should set out a standardised way of planning and evaluating interventions, and be in a format that enables staff to use them for large-scale national and small local interventions.

- **Establish a joint development programme with the Improvement and Development Agency (IDeA)**
  The programme should be a part of the existing local government learning hub supported by IDeA to capture and share examples of health-related social marketing. The examples should be collected in a standardised format and logged with the proposed knowledge bank.

- **Establish a university network to extend access to social marketing courses, modules and/or research programmes**
  Specialist standard setting and accreditation bodies, including the Chartered Institute of Marketing, should also be engaged with the university network. It should focus on equipping as many practitioners as possible with basic social marketing understanding and skills. Key recipients would include public health specialists, health promotion officers, health communication leads, teenage pregnancy co-ordinators, tobacco control leads, health trainers, health improvement leads and healthy schools staff, and community nursing staff.

- **Develop specialist social marketing roster**
  COI should develop a social marketing roster using quality criteria agreed with the DH that draw on the guidance produced by the NSM Centre on finding and selecting specialist social marketing agencies. The roster should include both national agencies and smaller contractors that can provide services for local public health teams.

- **Establish a social marketing fellowship scheme**
  The fellowship scheme could offer bursaries to mid-career public health, health promotion, health communication specialists and other relevant staff working in NHS. The scheme should be overseen by a board with representatives from relevant professional bodies, and aim to develop further participants' experience and academic understanding of social marketing. Sponsorship for the scheme

should be sought. The fellowships would allow experienced staff, who are looking to become social marketing leaders for the NHS, to work on national programmes, attend training and attain a formal social marketing qualification. The scheme would also support a limited amount of international travel for each fellow to visit effective social marketing projects in other countries.

- **Develop current dialogue further with the European Commission, World Health Organization Europe**
  The dialogue should focus on what support they can provide to facilitate sharing of information and learning about social marketing across Europe.

- **Integrate social marketing into core skills and competency frameworks for key public health and health communications-related staff working with the Public Health Development Team**
  To build working links between the NSM Centre, the Public Health Development Team and local workforce planners, public health networks, professional associations and other workforce planning groups, to incorporate social marketing training into appropriate courses and competency schedules.

- **Develop further the National NGO PHorum (Public Health) as a key vehicle for engaging key national NGOs in planning and delivery of all future social marketing enhanced national programmes and campaigns**
  Instigate a system for regular briefings between NGOs and DH policy leads. The NGO PHorum should be used as a mechanism for gathering views about good practice, intelligence and schedules of campaigns from the NGO sector to inform the planning delivery and evaluation of all future DH-commissioned programmes and campaigns.

- **Develop proactive DH partnerships with the mass media, writers, production companies, directors and producers**
  DH should establish a relationship with the CDC-funded Hollywood Health and Society service to exchange best practice. This service should also provide access to expert public health advice for the media sector to inform the development of documentary and drama programmes with a health focus.

- **Commission a national health communications guide based on social marketing**
  This would be similar to the *Pink book* commissioned by the US Department of Health and Human Services. The guide would bring together what is known about all aspects of effective health communications and draw on theory, evidence, planning tools and examples of good practice.

- **Ensure new media services form a integral part of all national social marketing programmes and campaigns**
  The development and marketing of all new media services, including the future development of Health Direct, will need to be developed as an integral component of all future social marketing programmes. There should be a rationalisation and integration of new media services including web sites. The development of any new service, should include the facility to act as a live data-gathering mechanism using tools such as the proposed Life Check. New media services such as Health Direct could be developed as joint ventures with established health information providers from the NGO, public and not-for-profit sectors. The DH should consider consolidating its new media expertise and services as part of its response to the Transformational Government strategy. There should be investment in developing expertise and understanding about the strategic application of new information technologies for health-focused social marketing. DH should develop a long-term plan to capitalise on the potential of new information technologies to promote health.

The recommendations
Strategic objective 5

Strategic objective 5
reconfigure research and evaluation approaches to ensure all work can directly assess movement towards relevant behavioural goals, and systematically capture and share learning

Operational principles

- Establish a clear behavioural focus, with research and evaluation geared to assessing and measuring actual impacts on behaviour
- Develop a shared and consistent approach, co-ordinating contributions from across policy, communications and research
- Systematically capture and record experience and learning from national and local practitioners.

Operational objectives

- **Establish a system for ongoing national health behaviour mapping**
  The system should map psycho-graphic factors, knowledge and behaviours and cover all the key *Choosing health* priority areas. The data collected should include what people 'know, feel and do' in relation to their health and well-being, as well as their views about the effectiveness of services and interventions developed to support them. The system should be able to provide reports at least every twelve months and more immediate feedback on the DH led work.

  If possible data should be drawn from existing surveys, however, it will be necessary for additional surveys to be commissioned to ensure the full range of data is available. Through the provision of time series data, the survey could be used as a key evaluation and tracking tool for all future social marketing programmes.

- **Establish a health-focused knowledge bank and tools**
  This knowledge bank should be part of, and linked to, the Cabinet Office strategic communication knowledge bank and the new National Public Health Library service. It should:

  – capture information on national and local interventions, what has worked, what has not, and what lessons have been learnt
  – collect examples of useful tools, learning materials and approaches
  – be the national contact point for the European Commission Health Information Platform project.

- **Establish a national archive of health programmes and campaigns**
  Collate, store and make available a library of national and local intervention plans, market research, evaluations and materials. The existing archive from the former Heath Education Authority, which is currently being held in storage by the NICE, and the archives held by the COI, should be incorporated.

- **Establish a health-related social marketing research hub**
  To improve access to all relevant health-related market research available from a variety of sources, including the private, NGO and public sectors. The hub should:

  – support programme and campaign leads in developing consumer understanding and insight
  – liaise and co-ordinate with the DH Health Insight Unit and other research and development teams within DH
  – work with other public health information providers as an integral and component part of the new public health intelligence strategy
  – provide specialist social marketing expertise in interpretation and development of health-related market research data
  – provide regular bulletins and updates to policy makers, local NHS planners and public health staff about relevant market research data that would help in planning and implementing health-related programmes and campaigns.

- **Assess the function of research and development in social marketing programmes and health-related campaigns**
  Develop proposals for the conduct of future independent evaluations of initiatives. DH proposals should include guidance standards for campaign development research, process evaluations, tracking studies and outcome evaluation. The research and development strategy should also incorporate ongoing reviews of evidence on social marketing effectiveness that captures learning from practice.

- **Enhance independent assessment and evaluation of all national programmes and campaigns**
  Ensure that all work introduces a clear element that is independent, so that those commissioning, developing and delivering work are not the only ones assessing impact and effectiveness. A specific research and evaluation protocol should be established and linked with research governance arrangements. The protocol should make clear the distinctions between formative, process and summative evaluation and ensure that summative evaluation is undertaken by an agency or body other than that delivering the programme or campaign.

- **Establish a health-related social marketing awards scheme**
  To provide a vehicle for ministers and senior officials to act as champions for programmes and campaigns that demonstrate significant impacts on behaviour. The scheme would also reward and value dynamic, creative and effective work in the field at national and local levels. The awards would stimulate debate and discussion on effective approaches and assist in the collation of best practice examples. Securing potential commercial sponsorship for this should be explored. Categories of award should be considered and assessed by a multi-professional judging panel against a set of agreed criteria consistent with the *social marketing benchmark criteria*. Consideration should also be given to establishing social marketing categories in existing national award schemes for people who apply social marketing principles.

- **Develop field briefing and intelligence gathering**
  Gather intelligence from, and proactively brief relevant field practitioners about future programmes and campaigns to improve impact and evaluation. Focus investment around existing arrangements, and investigate the best ways of engaging relevant practitioners and champions.

- **Commission a joint geo-demographic and psycho-graphic mapping project as part of the DH Public Health Intelligence Strategy**
  A demonstration project should be commissioned that explores how best to integrate traditional epidemiological and demographic data sets with commercially available market research and psycho-graphic data about people's beliefs and values. Key partners should include regional public health observatories, the DH Central Health Monitoring Unit and a commercial data mapping company. The project should use all relevant available public and commercially derived data sets to build a new integrated approach to population health profiling.

- **Establish constant live tracking of the impact of national programmes and campaigns**
  DH should work with other government departments and the COI to develop data capture systems that focus on behavioural impact as well as the awareness and attitudinal data to evaluate success. To facilitate this, all future programme evaluation plans should establish clear and measurable behavioural goals together with mechanisms for collecting and tracking impact data on the success of campaigns. The system should be capable of providing regular tracking data back to those responsible for managing the delivery of the campaign and programme. The data should also be used to inform the development of overall programme evaluation and the wider public health evidence base, and be made available to all public health practitioners.

The recommendations
Organisational delivery

Organisational delivery

- Separation of strategic and operational roles, and expert commissioning
- Potential contribution of the National Social Marketing Centre.

Separation of strategic and operational roles, and expert commissioning

If the Department of Health is to maximise the effective use of its resources, it needs to focus its efforts more clearly on an expert commissioning role, and reduce its direct hands-on development and delivery of work.

Government reviews have already established the importance of refocusing government department roles on 'doing only that which government departments can and should do' to ensure work is more systematically and consistently commissioned. However, for a number of reasons, this has as yet to be fully realised in practice across the DH. Interpretations of what constitutes in-house work and what is commissioned-out can vary, and therefore bringing greater clarity to this could significantly improve consistency across DH.

There is a strong case to suggest that the DH will continue to struggle to deliver real impacts against its key health targets unless it is able to free very limited staff time and capacity from direct management and delivery of hands-on health related initiatives. Policy and programme work needs to focus much more clearly on supporting ministers and senior officials to lead effective policy development, strategic planning and related commissioning of work.

This means that key senior officials should be directly tasked with leading work proactively with staff teams to establish exit or transfer strategies to reduce the direct role of officials in managing campaign development, implementation, delivery and related evaluation. It needs to be recognised that many existing staff enjoy this aspect of the work. Therefore, the benefits of adopting a more strategic expert commissioning role need to be well articulated, and over time staff skills and expertises directly geared towards this. This refocusing needs to be framed around strategic scoping of every national programme and campaign. A standardised process should be used to commission work, and also to monitor and review subsequent development and delivery.

A common approach to commissioning needs to be established, and relationships developed with a mixed-market of potential external organisations and bodies. This should include the COI, NGOs and the commercial sector, which can be readily contracted to manage development, delivery and review of national programme and campaign work.

Some key principles

- Clearer separation of policy, strategy and commissioning from direct development and delivery of initiatives
- Ensure greater clarity and support for effective ministerial oversight, championing and sign off for key national programmes and campaigns
- Introduce standardised planning and monitoring across all national programmes and campaigns
- Prioritisation of health programmes and campaigns based on consistent use of social marketing principles
- Enhance co-ordination mechanisms for cross government health-related programmes
- Ensure every programme and campaign produces written reports and makes these readily available to external practitioners.

DH reframed role

- Policy formulation and support to ministers
- Strategy development and expert commissioning
- Target development, setting and review
- Contract management and monitoring
- Internal cross-department co-ordination
- Cross-government co-ordination.

Organisational delivery

Potential contribution of the National Social Marketing Centre

The Department of Health decided to establish the National Social Marketing Centre (NSM Centre) at the National Consumer Council. This was as a direct response to its commitment in the *Choosing health* white paper to appoint 'an independent body' to support implementation of the National Social Marketing Strategy for Health.

The recommendations that follow have, therefore, been proposed on the basis that DH subsequently agrees a work programme with the NSM Centre to support DH in implementation of the strategy.

It is proposed that the Centre remains located at NCC for at least a further three years to ensure initial work can be capitalised on and the impetus sustained.

During this period it is recommended that work is undertaken to examine the feasibility of transforming the Centre into a not-for-profit social foundation. Efforts should be made to examine and secure potential additional resources from across other sectors, particularly looking at what the commercial and NGO sectors could potentially contribute to enhance the centre's resource and capacity base.

The following objectives are based on the review recommendations, and identify how the NSM Centre could support the strategy:

National Social Marketing Centre

Objectives (proposed)

1. **Develop social marketing-related capacity, skills and a portfolio of related resources**
2. **Support DH in integrating social marketing into all national programmes and campaigns, and in co-ordinating health-related activities**
3. **Provide a central resource for capturing information, intelligence and learning on effective social marketing-related activity**
4. **Develop a related research programme**
5. **Support cross-sector partnership working and assist development of co-delivery.**

The recommendations

What success should look like: National three-year review checklist

The success criteria checklist overleaf has been framed with particular consideration of the Department of Health's national role in leading and championing effective approaches to health improvement work. Many of the checklist items can also be readily applied to assess integration of social marketing at local and regional levels.

During the review, a number of field practitioners expressed the view that while they valued the lead that DH was taking to realise the potential of social marketing, they nevertheless had some doubts about whether this leadership would be sustained over time. There was a recognition that a busy policy and practice agenda can mean that initial good intentions could easily be overtaken by the impact of subsequent events, and the original drive and energy behind it lost or dissipated.

Therefore the following three-year review checklist has been developed to help assess the extent to which the Department of Health's commitment to integrate social marketing into its work is delivered and sustained over time.

The recommendations
National three-year review checklist

Success criteria – checklist	Yes/no	How otherwise addressed
1: A National Social Marketing Strategy for Health established with: • a clear aim and set of objectives guiding its development • internal and external practitioners briefed and fully aware.		
2: Social marketing formally integrated into all national health-related programmes and campaigns. Specifically: • *Social marketing benchmark criteria* being actively used and applied as part of the scoping and development process • standard planning system in place across all national programmes and campaigns • scoping reports available for all national programmes and campaigns and easily available to field stakeholders on DH and NSM Centre websites.		
3: National targeted training and skills development programme in place with: • all relevant DH policy, programme, communications and research staff have been through a basic phase 1 training programme. Selected key staff have taken a more in-depth phase 2 training programme • field practitioners across different sectors, including public health, health promotion and health communications, have access to tailored training events.		
4: Enhanced and integrated social marketing related research in place that includes: • national research hub collating and synthesising social marketing-related research and learning from multiple sources • national psycho-graphic tracking survey in place that is regularly used by national and local practitioners • consumer market research initiative linking and sharing understanding, intelligence, and consumer insights from different national programmes and campaigns.		
5: Programme in place to further capture learning and develop the evidence-base for effective social marketing that includes: • national archive in place to capture programme and campaign plans, information and evaluation • all national programmes and campaigns have an active publication strategies in place, and proactive encouragement to publish work in professional and academic publications • key co-ordination mechanisms in place to share information and learn from development across work streams that includes: – internal DH social marketing forum – cross-government public campaigns group.		
6: Enhanced range of multi-sector partnerships in place that contributes directly to national programmes and campaigns and includes: • proactive strategy in place, supported by clear ethical guidelines for engagement with commercial sector • enhanced engagement with non-government and voluntary community sector.		

Appendices

Appendix A
Understanding and realising the potential of social marketing

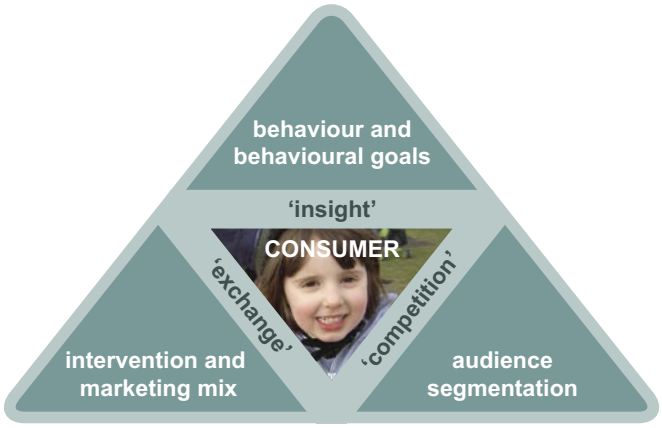
Social marketing is a powerful and adaptable approach for achieving and sustaining positive behaviours. The evidence is increasingly clear that by applying its concepts and principles systematically, the impact and effectiveness of interventions and related services can be significantly improved.

Defining social marketing

Based on the NSM Centre review of the historical development of social marketing definitions, the following definitions have been developed.

Social marketing is:
"the systematic application of marketing concepts and techniques, to achieve specific behavioural goals, for a social or public good"

Health-related social marketing is:
"the systematic application of marketing concepts and techniques, to achieve specific behavioural goals, to improve health and reduce health inequalities"



French, Blair-Stevens 2006

A brief history

Social marketing was first coined as a term in the early 1970's, and has been developed and expanded upon since then. It draws from both commercial marketing, as well as many years of experience of international social marketing in the public, not-for-profit and non-governmental sectors. It also builds on health and social reform campaign-related work that has been used to reach and engage different audiences and communities within the UK for many years. There is a growing evidence-base for social marketing.

Key concepts and principles

The *social marketing customer triangle* below highlights a number of core concepts and principles of Social Marketing.

'customer triangle' nsmc © 2006

1: Customer or consumer placed at the centre
Social marketing begins and ends with a focus on the individual within their social context.
The main concern is to ensure all interventions are based around and directly respond to the needs and wants of the person, rather than the person having to fit around the needs of the service or intervention. Social marketing always starts with seeking to understand *'where the person is at now'* rather than *'where someone might think they are or should be'*. This helps avoid 'top-down' approaches and the tendency to start crafting messages or interventions, before a real understanding of the issue is reached.
Example: A smoking cessation programme for pregnant women in Sunderland **r.j.lowry@ncl.ac.uk**

2: Clear 'behavioural goals'
Social marketing is driven by a concern to achieve measurable impacts on what people *actually do*, not just their knowledge, awareness or beliefs about an issue. Establishing 'behavioural goals' requires going beyond the traditional focus on 'behaviour change' to recognise the dynamic nature of behaviour within a whole population. It looks at both the positive

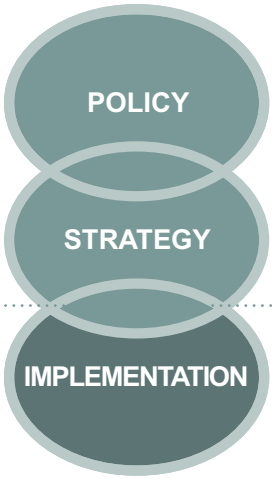
and the problematic behaviours to understand the relationship between them and looks to identify patterns and trends over time and what influences these. A behavioural goals approach also describes the aim of an intervention in terms of specific behaviours, and considers manageable behavioural steps towards a main behavioural goal.
Example: 'Food Dudes', a healthy eating programme. **www.fooddudes.co.uk**

3: Developing 'insight'
Social marketing is driven by *'actionable insights'* that are able to provide a practical steer for the selection and development of interventions. To develop such insight means moving beyond traditional information and intelligence (e.g. demographic or epidemiological data) to looking much more closely at *why* people behave in the way that they do. Consideration is given to the possible influences and influencers on behaviour, and specifically what people think, feel, and believe. Importance is placed on considering those things within and outside an individuals control.
Example: A mouth and bowel cancer initiative encouraging early attendance at the NHS. **www.woscap.co.uk**

4: 'The exchange'
Social marketing puts a strong emphasis on understanding what is to be 'offered' to the intended audience, based upon what *they* value and consider important (e.g. short-term v long-term benefits). It also requires an appreciation of the 'full cost' to the audience of accepting the offer, which may include: money, time, effort, social consequences, etc. The aim is to maximise the potential 'offer' and its value to the audience, while minimising all the 'costs' of adopting, maintaining or changing a particular behaviour. This involves considering ways to increase incentives and remove barriers to the positive behaviour, while doing the opposite for the negative or problematic behaviour.
Example: 'Think!', a national road safety campaign. **www.thinkroadsafety.gov.uk**

5: 'The competition'
Social marketing uses the concept of 'competition' to examine all the factors that compete for people's attention and willingness or ability to adopt a desired behaviour. It looks at both external and internal competition.

- External competition can include those directly promoting potentially negative behaviours but can also include other potentially positive influences that might be seeking to influence the same audience.
- Internal competition includes the power of pleasure, enjoyment, risk taking, habit and addiction that can directly influence a person's behaviour.



Example: 'Truth', a youth-focused anti-tobacco campaign in the U.S. **www.protectthetruth.org**

6: Segmentation
Social marketing uses a developed 'segmentation' approach. This goes beyond traditional 'targeting' approaches that may focus on demographic characteristics or epidemiological data, by considering alternative ways that people can be understood and profiled. In particular it looks at how different people are responding to an issue, what moves and motivates them. This is often referred to as 'psycho-graphic' research. It ensures interventions can be tailored to people's different needs.
Example: An illicit drugs programme in Australia. **www.drugs.health.gov.au**

7. 'Intervention mix' and 'marketing mix'
Social marketing recognises that in any given situation there are a range of intervention options or approaches that could be used to achieve a particular goal. It focuses on ensuring a deep understanding and insight into the customer, is used to directly inform the identification and selection of appropriate intervention methods and approaches. As single interventions are generally less effective than multi-interventions the issue is also to consider the relative balance or mix between interventions or approaches selected. Where this is done at the strategic level it is commonly referred to as the 'intervention mix' while at the level of a dedicated social marketing intervention the term 'marketing mix' is more common.
Example: A national tobacco control campaign in England. **www.givingupsmoking.co.uk**

How to approach social marketing

Social marketing can be considered in two key ways, strategically and operationally:

Strategic social marketing

Policy development and scoping
Informed by social marketing 'insights'
eg. citizen/customer/customer insight

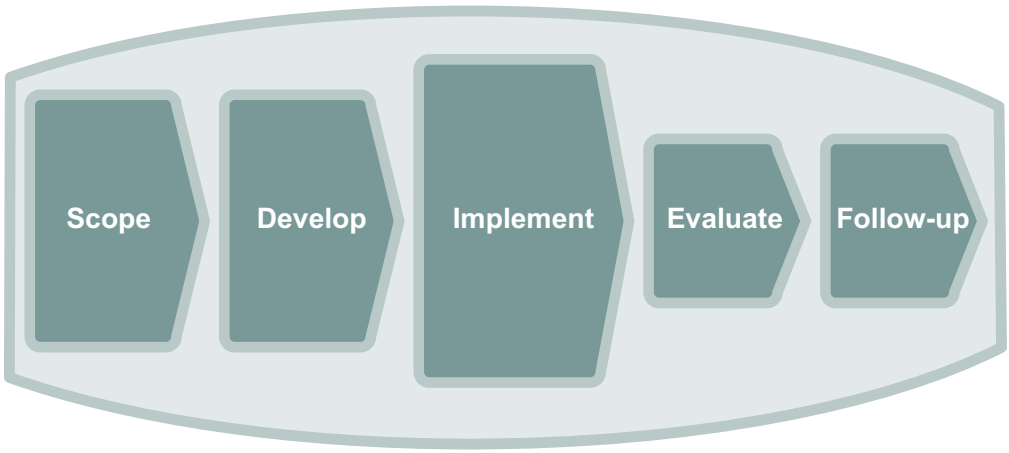
Strategic intervention scoping
Informing selection of interventions to achieve goals
As an intervention option in its own right, alongside others,
ie: a component of the intervention mix

Operational social marketing

Applied as a planned process at different levels
- Social Marketing Initiative – shorter term
- Social Marketing Campaign – medium term
- Social Marketing Programme – longer term

Also able to directly assist service design, development and delivery

Strategic Social Marketing



Where social marketing concepts and principles can be used to inform and enhance strategic discussions, and guide policy development and intervention option identification.

Operational Social Marketing

Where social marketing is applied as a process and worked through systematically to achieve specific behavioural goals. The total process-planning model below sets out such a basic planning approach.

Total process planning model

Undertaking and applying social marketing approach as a dedicated intervention, systematically planned and staged to achieve specific behavioural goals

Social Marketing Programme	Social Marketing Campaign	Social Marketing Initiative
Used to refer to a longer term planned programme of work	Commonly consisting of a range or cluster of activities	Used to refer to a time specific targeted intervention
Typically staged over 3 to 10+ years	Typically staged over 1 to 3 years	Typically undertaken within 1 year

Appendix A
Social marketing benchmark criteria

French, Blair-Stevens (2006) adapted from original benchmark criteria developed by Andreasen (2001)

Benchmark	Explanation
1. Behaviour goals	• Intervention clearly seeks to impact on behaviour, whether individuals or groups, relevant to a social or public good • A broad inclusive approach to behavioural goals adopted that cover establishing, maintaining, and where necessary, changing relevant behaviours • Specific measurable behavioural goals and related indicators have been established to guide all development work and are phased in a realistic way over time. This can include addressing knowledge, attitudes and beliefs, but only where these can be clearly linked to achieving a specific behavioural goal.
2. Consumer research and pre-testing	• Formative market research used to identify audience characteristics and needs • Range of different research and data sources used to inform development • Pre-testing is integrated into development and used to test out with relevant audiences all insight and developing methods.
3. Insight driven	• Approach based on identifying and developing actionable insights using considered judgement, rather than simply generating more data and intelligence • Focus clearly on gaining a deep understanding and insight into what moves and motivates the consumer/citizen.
4. Theory-based and informed	• Actively assess and draw from theory across different disciplines and professions - ie. it does not seek to apply the same theory or set of theories to every context, but focuses on identifying those that offer the greatest potential for understanding the influences on behaviour • Theory directly used to inform selection and development of an appropriate intervention.
5. Segmentation and targeting	• Moves beyond simple demographic or epidemiological targeting • Different segmentation options and variables are actively considered when identifying the appropriate target audience. Particular focus on understanding what people think and feel about issues using psycho-graphic data • Interventions directly tailored to particular audience segments.
6. Marketing mix	• Uses a range of methods and approaches to establish appropriate marketing mix • Methods and approaches developed taking full account of any other interventions in order to achieve synergy and enhance the overall impact.
7. Exchange	• Clear analysis of the full costs to the consumer in achieving the proposed benefit • Incentives and barriers are considered and addressed for positive, negative or problematic behaviour • Attention is given to maximising tangible and intangible benefits for adopting, sustaining or changing a behaviour.
8. Competition	• Specific consideration of both internal and external competition • Active consideration is given to the personal appeal of competing behaviours and external factors promoting or reinforcing potentially negative or problematic behaviour • Active consideration is given to the potential impact of other positive interventions that could compete for the attention of the audience. • Strategies employed to help address and minimise such competition.

Appendix B
National Social Marketing Centre – governance, aims and objectives

Governance arrangements

National Social Marketing Centre

Current aim to:

- help realise the full potential of effective social marketing in contributing to national and local efforts to improve health and reduce health inequalities.

Current objectives to:

- **undertake and produce an independent national review report (for 2006)**
  Undertake relevant research (see below) and develop proposals for the first National Social Marketing Strategy for Health and a set of recommendations for ways to enhance the impact and effectiveness of activity
- **provide direct social marketing support, guidance and related skills development**
  Focus on key DH *Choosing health* work programmes and support across the wider public health system
- **develop a practical social marketing resources portfolio**
  Increase understanding of social marketing and support effective planning, development, and evaluation.

Research programme objectives to:

- review the evidence base for social marketing in a number of key areas
- assess current government department practices and effectiveness in delivering health-related interventions
- understand stakeholder perceptions of social marketing – past and present
- compile a report on key behavioural trends and progress towards government targets
- assess the cost to society of preventable ill-health and assess social marketing's contribution to reducing that cost
- understand and map national capacity to deliver social marketing
- understand and map the key market and social research resources currently available to social marketeers.

Enabling Effective Delivery of Health and Wellbeing

An independent report

February 2010

Sir Howard Bernstein
Dr Paul Cosford
Alwen Williams CBE

Contents

Introductory Letter 3
1. Executive Summary 4
2. Introduction 14

Section 1: Priorities and Objectives 16
3. Health Expectancy 16
4. Lifestyle Interventions and Mental Health 20
5. Long-term Conditions 22

Section 2: Recommendations to Enable Effective Delivery 24
6. Strengthened Cross-government and Department of Health Action on Health and Wellbeing 24
7. Integrated Commissioning Model for Health and Wellbeing 26
8. Integrated Public Sector Delivery at a Local Level – with a Particular Focus on Children 29
9. A Renewed Vision for Primary Care and General Practice 32
10. Focusing the NHS on Prevention 35

Annex A: Summary of Recommendations 38
Annex B: Terms of Reference 40
Annex C: Consultation 41
Notes 42

The three co-authors of *Enabling Effective Delivery of Health and Wellbeing* are:

Sir Howard Bernstein

Sir Howard became Manchester City Council's Chief Executive in 1998.

He is known for forging partnerships with the City's key players and for successfully attracting millions of pounds into the City. He played a key role in the regeneration of Hulme, the first area in the UK to attract City Challenge status; and subsequent area regeneration initiatives including the Bridgewater Hall, the Velodrome, the International Convention Centre, the City of Manchester Stadium and City Art Gallery.

Recognition of Sir Howard's contribution to Manchester includes being awarded honorary degrees by UMIST, Manchester University and Manchester Metropolitan University. He was knighted for his services to Manchester in the New Year's Honours 2003 and was recognised with a Lifetime Achievement Award at the Regeneration and Renewal Awards in 2008. Sir Howard took up appointment as Chairman of Blackpool Urban Regeneration Company in July 2008.

Dr Paul Cosford

Dr Paul Cosford has been the Regional Director of Public Health for the East of England since August 2006. He leads the public health function across the NHS and the Government Office for the East of England, ensuring the alignment of actions to improve health across the public sector. He is responsible for the oversight of population health improvement, programmes to reduce health inequalities and emergency planning, as well as strategic responsibilities for improving the health and wellbeing of children, people with mental health and people with learning disability.

Paul has a particular interest in developing pragmatic programmes to improve health that involve the NHS, local authorities and the wider public sector, and is committed to ensuring that the full corporate efforts of these organisations support improved wellbeing across local communities. He also established the NHS Sustainable Development Unit, which leads the NHS's programme to reduce its carbon footprint and ensure sustainability of its operations.

Ms Alwen Williams CBE

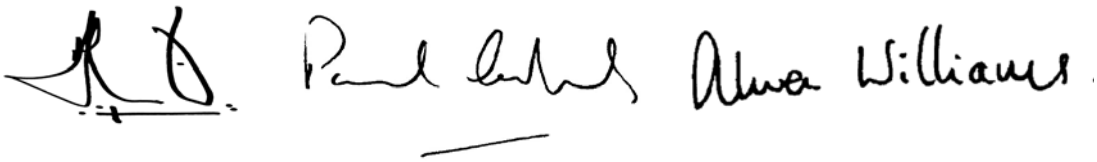
Alwen took up post as Chief Executive of Tower Hamlets Primary Care Trust (now NHS Tower Hamlets) in June 2004. In addition to her role in Tower Hamlets she was this year appointed chief executive of the East London and the City Alliance, in which Tower Hamlets, Newham and City and Hackney PCTs will work together to strengthen commissioning arrangements across the sector. Alwen has worked in primary care, community and acute services, commissioning and joint planning. She was a member of the national board advising Professor Lord Ara Darzi on primary and community care development. In the 2009 Queen's birthday honours Alwen was appointed a CBE for services to healthcare.

Mary Jane Ritchie was Secretary to the Report.

Introductory letter

Dear Andy,

We are delighted to enclose our report on the delivery of health and wellbeing services in England. We found this an exciting opportunity to inform your thinking on this important topic.



Our starting point for this report was how we can improve delivery in the current and future economic climate. It is our belief that we urgently need to strengthen the financial case for preventing ill health, and within this report we make several recommendations to support this, with better data on cost-effectiveness and return on investment. Delivery on this agenda remains crucial because of the influence that health and wellbeing has on individual motivation, achievement and productivity within the labour market.

We do not believe there is great expense needed to deliver our recommendations; it is, rather, emphasis and well-targeted changes to systems that are needed. We focus first on the need for clarity of high-level goals across systems. An overarching aim to increase the level of health experienced in life is a sensible augmentation of current life expectancy measures. Underlying this must be a strong focus on the biggest lifestyle influences on population health: physical inactivity, tobacco, alcohol and poor diet.

Health and wellbeing has a central role in creating successful places, and our recommendations on the furtherance of integrated commissioning and the role of general practitioners point the way towards service redesign and better delivery locally. Also at a local level, the power of the NHS and the local public sector to affect outcomes is substantial, and we propose stronger prevention roles and training to shift culture towards prevention of ill health and improved wellbeing. Pre-school children and those with existing long-term health conditions are population groups of paramount importance, where investment would pay significant health dividends: our recommendations seek to promote delivery and focus on their wellbeing. National and interdepartmental coherence across health and wellbeing policy is needed to underpin and support all changes, ensuring aligned front-line messages, coordinated policy and inspection processes.

If the very real links between an individual's health and wellbeing and their ability to lead a productive life are maximised, it will produce significant benefits to individuals, the NHS, the economy and the society we live in.

Yours,

Howard Bernstein, Paul Cosford, Alwen Williams

1. Executive Summary

This report offers recommendations to the Secretary of State on how better to enable the delivery of improved health and wellbeing. The Terms of Reference (provided at Annex B) for this report requested an assessment of the current opportunities and barriers in delivery systems, to identify where practical changes could be made to improve effectiveness.

This report is not a full review of interventions to improve health and wellbeing, and is not a new health and wellbeing strategy. Rather, the authors have held a series of discussions with key individuals and groups involved in delivery, and have considered why the ambitions of previous strategies have not always been fulfilled. They have come to the view that a small number of specific issues could be addressed, and that this would significantly improve the effectiveness of approaches to improve health and wellbeing.

We believe that the implementation of these recommendations could greatly support prevention as a role for the NHS and improve quality and productivity. This will be particularly significant given the challenges facing the public sector in the near future.

Our view is that physical and psychological health and wellbeing is an essential foundation for a prosperous and flourishing society. It enables individuals and families to contribute fully to their communities, and underpins higher levels of motivation, aspiration and achievement. It improves the efficiency and productivity of the labour force – critical to ensuring economic recovery. Poor health and wellbeing also costs a great deal through medical and social care costs, reduced productivity in the workplace, increased incapacity benefits, and many other calls on public services and community support. Our most deprived communities experience the poorest health and wellbeing, so systematically targeting approaches on the geographical areas and population groups at greatest need is crucial in reducing inequalities.

Four behavioural risk factors – tobacco use, physical inactivity, excess alcohol consumption and poor diet – are the biggest behavioural contributors to preventable disease. These 'top four' are responsible for 42% of deaths from leading causes and approximately 31% of all disability-adjusted life years (World Health Organization, *The European Health Report*, 2005). Tackling behavioural risk factors is often seen as an issue among younger, predominantly healthy people, but behavioural factors are also major risk factors in the onset and relapse of, and premature mortality from, long-term conditions such as diabetes, cardiac disease and respiratory disease, and for increased disability from musculoskeletal conditions and mental ill health. There is also strong evidence that reducing behavioural risk factors in older people significantly increases both quality and length of life, irrespective of any pre-existing long-term condition. With ageing of the population, it is critical that we have a strong focus on improving health and wellbeing in older people.

In addition to these 'top four', there is strong evidence that improving mental health and wellbeing significantly reduces physical (as well as psychological) ill health. This is the basis of the current national programme to increase the provision of psychological therapies (improving access to psychological therapies, or IAPT).

Of course, a range of social and economic issues underpin people's lifestyles and behavioural risk factors. This needs strong, coordinated action across the public sector, reflected in cross-government action nationally. We are of the view that, within this action, the health and wellbeing of pre-school children is of paramount importance, and has a profound impact on their later adult health and wellbeing. Supporting children and their families to improve their health and wellbeing is vital for them if they are to live healthy and prosperous lives, irrespective of their social background, and if they are to reach adulthood able to achieve their fullest potential.

Such information on health effects needs to be translated into meaningful, national and local articulation of the business case for prevention. This would illustrate the value-for-money case for interventions. Local investment in the NHS and across the public sector can then be appropriately scaled to the outcomes and benefits that the NHS, the public sector and the wider community will gain.

Underpinning this, we are of the view that there is a need to confirm an overarching policy objective to improve healthy life expectancy (and therefore health and wellbeing), against which other policies are judged. This could be termed 'Health expectancy'. Setting this as an overall policy objective would lead to prioritising action to improve health and wellbeing and so reduce the onset and relapse of long-term illness, reduce inequalities, improve the quality of life years lived, and increase years lived in good health. The health and wellbeing of those with disabilities is also vital. This overall policy objective therefore needs to include enhancing the health and wellbeing of people with disability, supporting them to live fulfilled and self-directed lives.

The current average life expectancy and disability-free life expectancy is represented by the first bar on the figure below, with the impact of many currently prioritised health interventions being to increase overall life expectancy but not disability-free life expectancy (second bar). Ideal interventions increase both disability-free life expectancy and overall life expectancy (third bar).

Improving health expectancy: policy options

Representation of current average life expectancy

– a substantial portion of lives, particularly in disadvantaged groups, spent in ill health

Impact of many current health interventions

– increase overall life expectancy by increasing life lived with disability

'Ideal' health interventions

– increase disability-free life expectancy and overall life expectancy

Many important healthcare interventions increase life years lived with disability, and achieve the outcome represented by the second bar. However, many interventions that cost less and are more cost-effective increase disability-free life expectancy, yet are not routinely implemented. For example, increasing physical activity improves mental health and wellbeing, reduces rates of heart disease and cancer, reduces the likelihood of developing diabetes in those at risk, reduces deterioration and supports fulfilled lives in people with many established long-term conditions and disabilities, and improves mobility, quality of life and life expectancy in older people. National Institute for Health and Clinical Excellence (NICE) appraisals of healthcare technologies are rightly expected to be implemented across the NHS within three months. However, NICE guidance on improving rates of physical activity, which identifies interventions that are considerably more cost-effective than many health technologies, does not have the same expectation of implementation.

However, understanding the cost-effectiveness of intervention is not always sufficient to support investment decisions. The opportunity to develop measures of cost impact of interventions and return on investment should also be explored.

It is our view that an increase in health expectancy and an improved quality of life and reduction in disability for people with long-term conditions, should be the benchmark by which to judge new policies. It should also underpin judgements on the priority to be given to different interventions by the NHS and other public sector organisations. We make three recommendations, which, we believe, will support this policy objective to become a reality:

Recommendation 1:
We recommend an overarching tier 1 vital sign to improve disability-free life expectancy (health expectancy), in addition to the existing vital sign indicator on life expectancy. This should be supported by tier 2 vital signs for local agreement on the four major lifestyle factors (smoking, alcohol, physical activity and diet) and psychological wellbeing. These metrics should also be included in national indicators.

Recommendation 2:
The Department of Health should explore with NICE the explicit identification of the impact of clinical and public health guidance on overall life expectancy and on health expectancy, and quality of life for people with disability and long-term conditions. NICE should produce rankings of the most cost-effective clinical and public health guidance, with an expectation of delivery of the most cost-effective. The feasibility to provide assessments of cost impact and return on investment should also be explored.

Recommendation 3:
The impact on health expectancy should be used explicitly to judge the benefits of new policies that impact on health and wellbeing.

Supporting this overarching policy objective, we consider there to be several specific practical actions that can strengthen delivery of health and wellbeing. These are addressed in turn opposite.

Strengthened cross-government and Department of Health action on health and wellbeing

Actions to improve health and wellbeing are frequently outside the NHS, and mechanisms to ensure cross-government action sometimes appear to lack the impact needed to be most effective. Physical activity is illustrative, as there is good evidence that it is affected by the physical design of schools, school travel plans, the design of the built environment, the extent to which transport infrastructure encourages physically active travel, access to the natural environment, access to leisure facilities, and interventions in the workplace. It also has beneficial impacts on health and wellbeing at all ages, on educational outcomes and on economic productivity.

Strong policy coordination across government departments requires greater understanding of health and wellbeing and its contribution to wider community prosperity, and of the role of different government departments in improving health and wellbeing. The Department of Health has a leadership role across government. The specific responsibilities of other departments need to be clear, particularly where action is the collective responsibility of several departments. Government Offices have a clear role to facilitate integrated approaches across departments at a regional level. However, we are uncertain of the most practical way to achieve a strengthening of arrangements at a national level, and believe that ministers and other senior officials within the Department of Health will have a better view of what will work. We believe that a range of options may be appropriate, from time-limited cross-government working groups to advise on individual aspects of health and wellbeing policy, to models such as the new national safeguarding delivery unit (NSDU), which supports action to improve children's safeguarding. We make the following recommendation:

Recommendation 4:
Stronger and more innovative mechanisms are needed for cross-government actions to improve health and wellbeing, including mechanisms to identify the role of different government departments and their delivery systems.

Effective implementation of health and wellbeing initiatives needs coordinated action at a local level across all NHS activities, as well as in partnership with other public sector bodies. To support this, it is vital to identify – at a national level – the evidence for effectiveness and the economic case for action, metrics for judging success, and the means of delivery through world-class commissioning and action across the public sector. This needs to be reflected in improved coordination across the Department of Health, with input from teams working on health improvement and protection, NHS workforce, social care, primary care, world-class commissioning, system management, local and regional partnerships, inspection and standards. A single team with a single point of leadership may be an appropriate mechanism.

We have found the national support teams to be extremely valuable in supporting practical local delivery of health and wellbeing outcomes. Their experience should be used to ensure that national approaches are grounded in the reality of delivery, informing the national coordination of policy and expectations of the delivery system.

All current inspection processes should emphasise the importance to the NHS of prevention. The Department of Health should aim for inspections to be coherent and, where possible, aligned so that front-line organisations can set priorities on a consistent basis. We recommend alignment of the world-class commissioning and comprehensive area assessment processes.

Recommendation 5:
A single point of leadership should be considered within the Department of Health, able to draw on expertise across the Department, with the role of ensuring strategic coherence in all areas of health and wellbeing policy and delivery. The experience of national support teams should be used to strengthen this work.

Recommendation 6:
Local health and wellbeing goals should be articulated and reviewed consistently and together within a single approach to inspection.

Integrated commissioning model for health and wellbeing

We propose that the policy actions identified through the strengthened arrangements across government and within the Department of Health should be implemented through a new integrated local commissioning model for health and wellbeing. This needs to identify explicitly how the NHS and local partners commission jointly to deliver improved health and wellbeing, building on strengthened local joint strategic needs assessments. The specific roles of primary care and different sectors of the NHS, social care and other local authority services, and other public sector partners are key in ensuring effective delivery, as is the role of local area agreements and other partnership arrangements in supporting integrated action on health and wellbeing. We envisage this integrated commissioning model being driven by local strategic partnerships, with localised health and wellbeing strategies and delivery plans being developed in response to local needs.

The vision is that the quality of integrated commissioning would be enhanced at each stage of the commissioning cycle. To assist in this, the national support package offered to assist localities would include improved modelling of lifestyle burdens for primary care trust (PCT) and local authority areas, support for needs assessment (for example, through a needs assessment tool), tools to tailor NICE guidance on health and wellbeing to local populations, more robust information on links between investments and outcomes, and a supporting basket of indicators for health and wellbeing.

Strong leadership across the local public sector is needed to ensure integrated commissioning of health and wellbeing. Local public sector leadership development programmes will support this strengthened delivery. Children's trusts would be well placed to lead on integrated commissioning for children.

Recommendation 7:
A new integrated commissioning model for health and wellbeing should be developed to improve health and wellbeing outcomes. This model should, as a priority, be applied to the 'top four' lifestyle issues, children's health, and prevention and effective management of long-term conditions.

Recommendation 8:
We recommend the development of integrated public sector leadership development programmes at the local level to ensure delivery of improved health and wellbeing.

Integrated public sector delivery at a local level – with a particular focus on children

Integrated commissioning will drive better integration of delivery at a local level. The example of children is illustrative, where different professions from various public sector bodies work with the same children and families of greatest concern, and potentially at greatest risk of a poor start in life. We believe that integrated delivery of public services for children under 5 is of the highest priority, given that patterns of behaviour and their impact on health and wellbeing are established in the very early years of life.

Children's access to interventions to promote their wellbeing is patchy, and under the age of 5 (when school attendance becomes compulsory) is most often dependent on parental engagement. This frequently leads to a situation where the children most in need of health and wellbeing assistance do not receive it, as their parents are the least engaged.

We are of the view that a strengthened children's workforce, with better integration between professions such as health visiting and social care, is needed to underpin interventions for children up to the age of 5 in these settings and build on the invaluable platform of children's trusts. One possibility that could be considered is a new profession of children's worker, integrating health and local authority roles.

People in the children's workforce need to be skilled in signposting health and social support, parenting skills, wider skills, and support services where necessary, intervening assertively when required, and providing cross-agency coordination and expertise in early years support. The authors welcome the targeted approach to public sector intervention for 0–5s where this is needed, such as in the Family Nurse Partnership Pilots, with their greater emphasis on parenting skills. We consider that the learning gained from these pilots needs to underpin the development of the children's workforce.

Better data on children is required for the public sector to systematically assist those with greatest needs. Sweden operates a system where a single national identifying number – used across all partners – enables all services to know from birth where children are living, and to record information on what services are being accessed for that child. This allows monitoring of children, with intervention scaled to level of risk. At present, England has two comparable information systems. The first system, ContactPoint is being rolled out nationally following a successful early adopter phase in 2009. It holds

basic information that allows professionals to contact other professionals working with the same child. The second system is the electronic enablement of the Common Assessment Framework (eCAF). This is due to be rolled out to early adopters from spring 2010. National eCAF is a tool to aid assessment of children's additional needs, and to support joint working to meet those needs. Consistent use by health professionals of both these systems would promote safeguarding and enhancement of children's health and wellbeing, and have significant benefits in terms of time saving for practitioners.

We also consider that increased support for delivery through general practice would be of benefit. Steps that could support this include consistent training for all GPs on health and wellbeing in children, better data sharing, shared incentives through alignment of vital signs and national indicator set measures, and joint training on basic skills and understanding of health and wellbeing, recognising the importance of motivation and behaviour change skills. Language to describe the health and wellbeing agenda needs to be inclusive and overtly aim to avoid alienating key partners in the delivery of health and wellbeing.

Recommendation 9:
We recommend strengthening the integration of the workforce for children's health and wellbeing, reflecting an emphasis on health and wellbeing outcomes, early intervention, and intensive case management wherever needed.

Recommendation 10:
We recommend stronger support and encouragement for NHS staff to record their involvement with children on ContactPoint, and to use it to support their practice in working with other practitioners, as well as to assist child protection.

Renewed vision for primary care and general practice

While health and wellbeing requires action across the whole public sector and government, the role of general practice is fundamental to prevention at an individual and community level. It is acknowledged that its unique role and access to the population can allow for improved case management, self-care and coherence with other local professionals.

We would recommend enhancing the role of GPs in supporting change in behavioural risk factors and mental wellbeing. There need to be weight management services appropriate to children and their families, as well as to adults, interventions to improve diet and physical activity, support to stop smoking and to drink within sensible limits, and psychological therapies.

To ensure that service provision meets evidence of best practice, we consider that each PCT should develop a list of approved health and wellbeing services for GPs to access for their patients. Inclusion of health and wellbeing services in Choose and Book would promote referrals and intervention on issues of health and wellbeing.

We consider that models for general practices should be explored, in which the 'deal' for signing on with a particular practice includes the GP assertively addressing behavioural risk factors with patients – similar to the approach taken by some health maintenance

organisations in the USA. This could be identified explicitly as a reason for patients choosing their GP. It should be supported by the development of tools to identify the reductions in healthcare expenditure that will result from reductions in behavioural risk factors in the practice population (such as smoking), in order to illustrate the potential savings to practice-based commissioning budgets.

Systematic approaches to early intervention on risk factors and to secondary prevention to support improved wellbeing in people with long-term conditions is also vital. The role of general practice in targeted case finding and proactive management of major long-term conditions should be strengthened. This, and improved support for self-care, has the potential to save considerable health and financial cost by bringing about a reduction in complications and emergency admissions.

We are concerned that the Quality and Outcomes Framework does not offer an incentive to provide care for the whole population, reflected in the targets for many quality indicators of covering 70% to 80% of the practice population. While we understand the rationale, the most needy, with the poorest health and wellbeing, are significantly over-represented in the other 20% to 30%. We are not sure of the best solution to this, but we consider that primary care professional groups, including the Royal College of General Practitioners, the NHS Alliance and others, should be invited to co-produce a renewed vision for primary care, including the role of primary care teams in both the individual health of their patients and the health of the communities that they provide care for.

It will not be possible to have practices that support people to stay healthy with intervention on behavioural risk factors without improved skills at the practice level, reflected in enhanced roles for nursing, pharmacist and other practice staff.

Recommendation 11:
A renewed vision for the future role of general practice needs to be developed in consultation with the Royal College of General Practitioners, the NHS Alliance and other key partners.

Recommendation 12:
The Choose and Book system should be expanded to offer GPs the option to refer to health and wellbeing services. A directory of approved services for the major behavioural risk factors and psychological therapies should be developed; this would point GPs and other health professionals to where evidence-based services are available.

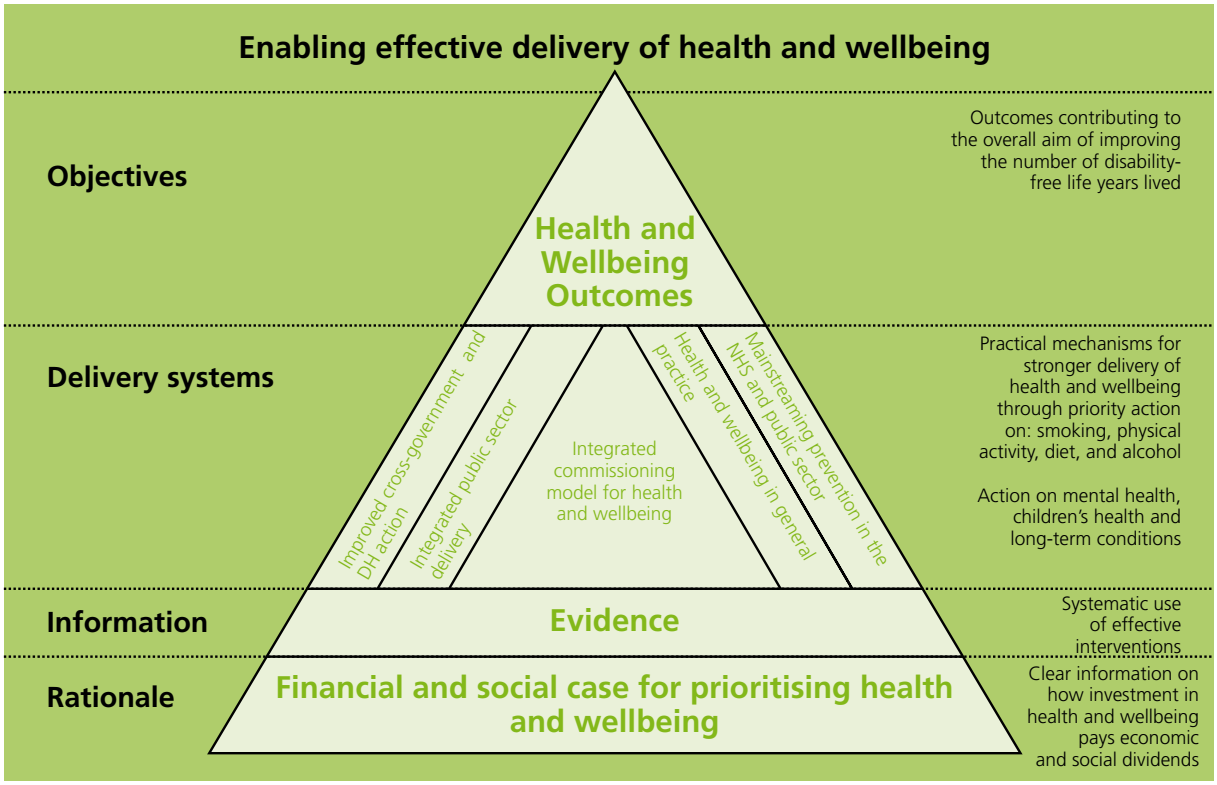
Recommendation 13:
Tools should be developed that enable practices to understand the business case for improved health and reduced costs of healthcare by addressing behavioural risk factors in the practice population. These will support practice-based commissioning and underpin a potentially assertive model of practice intervention.

Recommendation 14:
The role of general practices in targeted case finding, proactive management of long-term conditions and support for self-care should be prioritised and supported through commissioning arrangements.

Focusing the NHS on prevention

There is a strong commitment across the NHS to improve health and to be fully engaged in prevention, as well as treatment. However, there is still a gap between this commitment and the practical reality of NHS performance and delivery. For example, patients in acute hospitals are routinely asked whether they smoke, but it is rare for support to be offered to help them stop, despite the fact that staff want to be able to help and patients usually expect to be offered support. The reasons appear to include a lack of knowledge of what evidence-based services are locally available, and a lack of skills and confidence in the NHS workforce to support behaviour change.

We consider that it is possible to develop a service – which could be called 'NHS Prevention' – that will help translate into reality the aspirations of NHS staff to address health and wellbeing. This was identified as a priority in the NHS Next Stage Review, but the model for implementation has not been consistently identified. Each PCT would draw up its directory of approved services for health and wellbeing, as identified in recommendation 12. Health trainers (or health advocates), trained in supporting people to change behaviour, would work with individuals and help them address these risk factors, referring to services, as appropriate, from the directory of approved services. The health trainers (or health advocates) would include people based within communities (such as the currently prevailing health trainer model, targeted on the most deprived communities), but the model could be extended so that existing staff could develop this role – for example, nurses or other staff within practices, staff on acute hospital wards or within mental health services. This would act as a professional development to existing staff roles, and trusts and practices could identify this service as a reason to choose their hospital or service for care.



'NHS Prevention' developed in this way could support changes to behavioural risk factors in patients with other health conditions, such as heart disease, and form part of the range of interventions available following NHS life checks. The health advocates could champion and offer support to other NHS staff to improve their own health, and therefore contribute to future work based on the interim report of the recent review of health of the NHS workforce by Dr Steve Boorman. The model could also be extended to social care and public and private sector employers, to improve the health of their staff.

The business case to support this model needs to be fully worked up. However, we consider it likely that there is a strong case for developing the model for 'NHS Prevention' on the basis of an extension and development of existing staff roles, given existing evidence of the high cost-effectiveness of reducing the major behavioural risk factors for health, and of improving psychological wellbeing.

To underpin this, the Department of Health could encourage the embedding of health and wellbeing components into undergraduate, postgraduate and continuing professional training for all health and social care professionals.

Recommendation 15:
The model for 'NHS Prevention', and the business case to support it, should be developed urgently, as a means of embedding health and wellbeing further into the culture of the NHS.

It is the authors' view that these proposed changes to delivery systems will significantly reduce barriers to the ability of front-line organisations to improve health and wellbeing. This conceptual framework for the delivery of health and wellbeing is illustrated in the figure below.

2. Introduction

This report was commissioned by the Secretary of State for Health in April 2009, with a remit to:

- make recommendations on the future priorities for health and wellbeing; and
- make recommendations on what the Department of Health can do to best enable effective delivery on the front line.

This report sits alongside two other reports on health and wellbeing policy, exploring the appropriate role of the state and approaches to behaviour change. It does not reiterate prior vision statements, but aims to build on these with strong upstream and downstream measures to enable delivery.

Our task has been interpreted as primarily concerning health improvement, rather than the full breadth of health and wellbeing policy. Health inequalities and maximisation of the contributions to health and wellbeing made by public service organisations are a focus across all areas of the report. It is accepted that, across these aspects of health and wellbeing, it is necessary to work harder to deal with the needs of the most excluded than of those who are not disadvantaged. It is also necessary to take steps to eliminate discrimination and unfairness between different groups.

We see this report as addressing wider wellbeing. We see health, wellbeing, aspiration and motivation as inputs to economic and societal prosperity.

We acknowledge that major progress has been made in some areas, such as tobacco and cardiac disease mortality. There is, however, potential to do more on these behavioural risk factors, as well as on others, including obesity and physical activity.

Delivery across the agenda is piecemeal at present, and not as good as it could be. There are substantial benefits to be gained in terms of the quality of life and wellbeing of the population.

Greater leadership is desired for health and wellbeing, to help avoid conflicting messages being received at the front line.

We make no recommendations in this report on ringfenced budgets. These can clearly be helpful in protecting investment, but they also tend to identify health and wellbeing as separate from the mainstream function of the NHS and other public sector bodies. Whether or not budgets for health and wellbeing programmes are ringfenced, we consider it vital that the full corporate endeavours of the NHS and the wider public sector are applied to this purpose.

Key stakeholders and groups for delivery have been engaged in the development of this work. A summary of the consultations undertaken is provided at the end of the report (Annex C).

There are many previous and extensively researched reports into similar issues, including the Wanless Reviews;[1] *The Report of the Chief Medical Officer's Project to Strengthen the Public Health Function* in England;[2] *Choosing Health*;[3] and *Closing the gap in a generation*.[4] The report will not duplicate these efforts, but will highlight some areas where delivery against previous reports is still needed.

We have been convinced that the existing work of the NHS, local authorities, other public sector organisations and the third sector needs to address health and wellbeing more strongly. The report considers how current mechanisms can be aligned to support delivery of public health through the mainstream agenda of all those organisations that have a role to play.

The report is explicit in proposing strategic changes to organisational drivers, delivery processes and approaches. Current systems have not been used to their utmost. Therefore, we do not consider major structural change, but instead focus on radical improvements in the application of current resources and delivery systems.

In this light, we propose a small number of key recommendations. These have been drawn up with an eye to and concern for those changes that will achieve the greatest improvements in health and wellbeing for the population.

This report is structured to provide initially our rationale for focusing on specific objectives and priority groups, namely:

- improving the health expectancy, as well as the life expectancy, of the population;
- focusing on the 'top four' behavioural risk factors with the greatest impact on life expectancy (tobacco, physical activity, diet and alcohol) and mental health and wellbeing;
- prevention of the onset of long-term conditions and deterioration, and improvements in quality of life and fulfilment for people with disability; and
- strengthened focus and approaches to improving the health and wellbeing of children under the age of 5.

It then addresses delivery systems, from which our recommendations are drawn:

- strengthened cross-government and Department of Health action on health and wellbeing;
- the need for a new integrated commissioning model for health and wellbeing;
- integrated public sector delivery at a local level – with a particular focus on children;
- a renewed vision for primary care and general practice; and
- focusing the NHS on prevention.

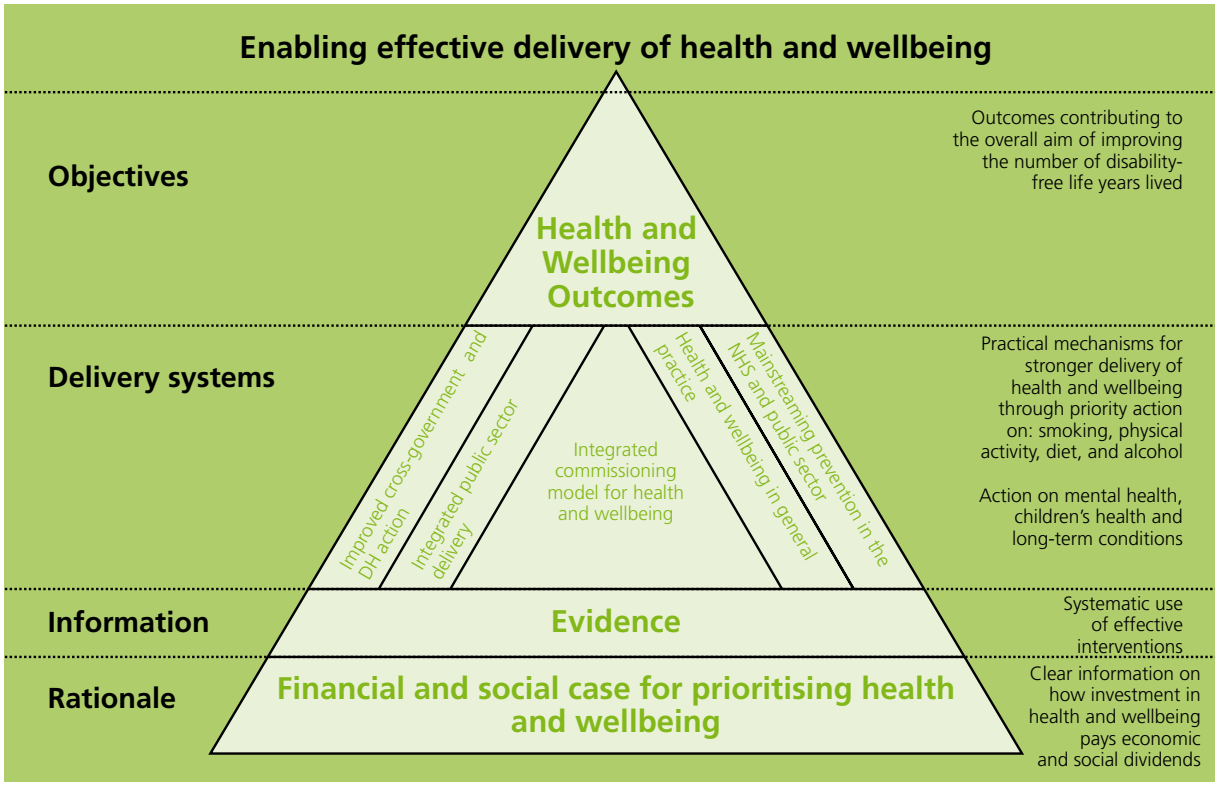
Health and wellbeing in older people is a critical issue, given the ageing of the population and the importance of maintaining independence and quality of life.

Section 1 Priorities and Objectives

3. Health Expectancy

> ***Focus and measurement of health and wellbeing should now reflect a desire to promote improved health and quality of life for the population as well as additional life expectancy.***

There are key factors that determine whether or not health and wellbeing receives sufficient investment or attention at the national, regional and local levels. Particularly in the present economic environment, the issue of cost and operational efficiency of action is central to decision making. Additionally, the importance and resonance of the outcomes of policy are critical. We will address these issues in turn.



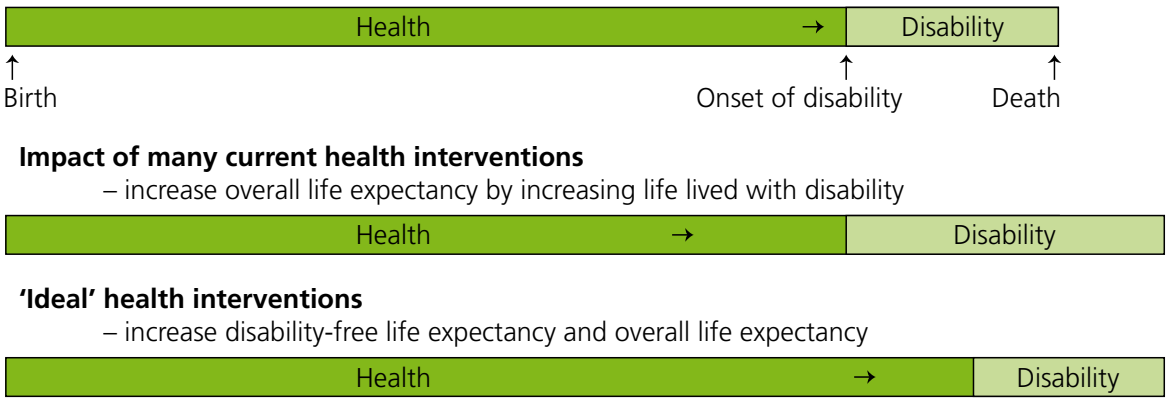
As illustrated in the following chapter on lifestyle interventions and mental health, a range of facts, cost-effectiveness data and financial data is available at the national level. Data on costs and health outcomes for health and wellbeing are also available through epidemiological evidence and National Institute for Health and Clinical Excellence (NICE) publication of economic information. There is, however, a lack of information to consistently help commissioners and local leaders perceive the financial case for intervention in prevention activity.

Examples of local-level efforts to draw together the financial case have been identified (example provided below), but such calculations are currently made on the basis of a historic, or estimated, level of provision. They do not articulate the full effects on the entire population if it were to receive the most effective package of interventions to prevent ill health.

An example of current return on investment calculations for a primary care trust[5]

TOPIC	INTERVENTIONS	Total investment after 5 years	Best case net saving after 5 years
ALCOHOL	• Provide screening of patients in primary care and appropriate advice for those with excessive drinking levels. • Provide brief interventions and facilitate behaviour change in those drinking at hazardous levels. • Refer to specialist treatment services as appropriate.	£812,000	**£3,349,000**
SMOKING	• Expand the current local services to target deprived and hard-to-reach communities. • Increase home visits to support pregnant women in their quit attempts and further develop support through midwifery services. • Promote tobacco control policies in public places and workplaces, including a Smoke-free NHS.	£305,000	**£1,248,000**
OBESITY	• Implement locally enhanced services in primary care to target all patients with a body mass index (BMI) of over 30 (or 28 with other health problems) in order to: – record BMI and offer advice and support for weight management; – provide motivational support for behaviour change; and – follow up patients.	£1,984,000	**£2,183,000**
TOTAL		£3,101,000	**£6,780,000**

Modelled effects for the benefit for the local area should include morbidity, mortality, economic and broader social effects on issues such as working time lost due to illness. Return on investment calculations for each geographical area should include modelled effects of intervening on tobacco, alcohol, physical activity, diet and nutrition, long-term conditions and health of children under the age of 5.

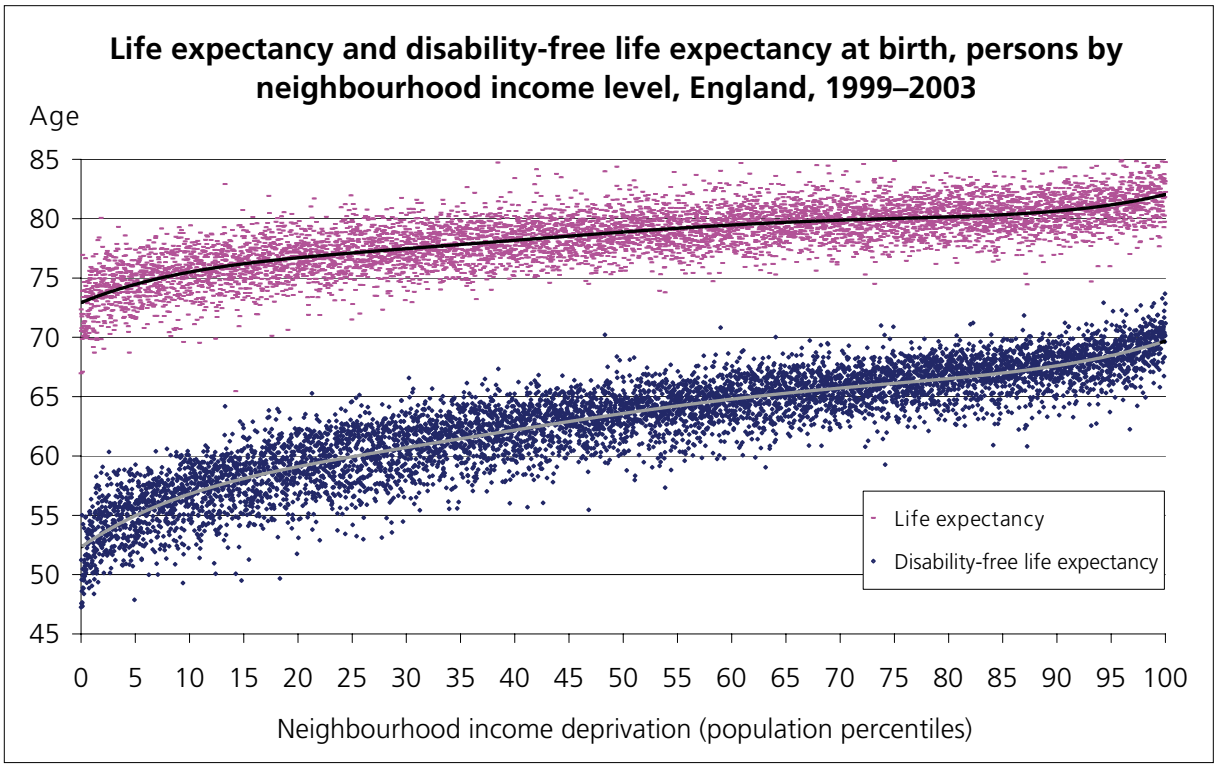


Health-burden information and evidence need to be tailored to local populations, so that assumptions made and interventions selected are appropriate to the demographic and societal context.

The Department of Health should help draw together a package of analysis to assist localities in making the broad financial and social case across the range of public sector investment in health and wellbeing.

Both conceptually and practically, systems and organisations require clear and meaningful objectives for health and wellbeing. We are of the view that an overarching policy objective to improve health expectancy (which takes account of the number of years lived without disability and with a good quality of life) should be added to the current objective to improve length of life. This reinforces the aspiration to add life to years, as well as years to life.

Improving health expectancy: policy options



The current average life expectancy and disability-free life expectancy (health expectancy) is represented by the first bar of the figure above, with the impact of many currently prioritised health interventions being to increase overall life expectancy but not disability-free life expectancy (second bar). Ideal interventions increase both disability-free life expectancy and overall life expectancy (third bar). Furthermore, we believe that most people may value an increase in disability-free life expectancy over an increase in absolute life expectancy.

Many important healthcare interventions increase life years lived with disability, and achieve the outcome represented in the second bar of the figure. However, many interventions that cost less and are more cost-effective increase disability-free life expectancy (health expectancy), yet are not routinely implemented. For example, increasing physical activity improves mental health and wellbeing, reduces rates of heart disease and cancer, reduces the likelihood of developing diabetes in those at risk, reduces deterioration in people with many established long-term conditions, and improves mobility, quality of life and life expectancy in older people. NICE's appraisals

of healthcare technologies are rightly expected to be implemented across the NHS within three months. However, its guidance on improving rates of physical activity, which identifies interventions that are considerably more cost-effective than many health technologies, does not have the same expectation of implementation.

Health expectancy is also a valuable indicator of inequalities. The diagram below, courtesy of the Strategic Review of Health Inequalities in England Post-2010 (the Marmot Review), shows the difference between life expectancy (the top line) and the point at which a person develops ill health (the bottom line). While the universal aim is for people to have poor health at a later age than at present (raising the bottom line for all), it is clear from this diagram that those in disadvantaged groups (on the left-hand side) are presently living far more years of their lives in disability than are those who are not disadvantaged (on the right-hand side). This means that not only are the disadvantaged dying sooner than their more advantaged counterparts, but they are also on average living for over 20 of those years in poor health.[6]

We recognise that, taken in isolation, this argument can appear to undervalue the fulfilled lives of people with disability or long-term conditions. We consider that improving the health and wellbeing of people with disability and with long-term health conditions, and enabling them to live more fulfilled lives, is also a vital policy objective.

Source: Office of National Statistics

For action on health expectancy, the Department of Health and other departments must know which interventions impact on life years lived without disability. Present guidance does not overtly rank interventions on this basis. NICE guidance should, therefore, be ranked on impact for both life expectancy and health expectancy, so that prioritisation and action across government can be directed at the interventions with most impact. The wider determinants of health should be included in this consideration.

In addition, there is growing evidence on how to measure the quality of life and fulfilment of people with disability. It would be appropriate to explore the opportunity to explicitly identify the impact of interventions to improve health and wellbeing, with the objective of applying those that are most cost-effective in terms of outcomes.

Finally, cost-effectiveness information alone is not sufficient to underpin investment decisions by the NHS and public sector partners. The opportunity to develop information on the cost impact and return on investment of implementing NICE guidance should also be explored.

Recommendation 1:
We recommend an overarching tier 1 vital sign to improve disability-free life expectancy (health expectancy), in addition to the existing vital sign indicator on life expectancy. This should be supported by tier 2 vital signs for local agreement on the four major lifestyle factors (smoking, alcohol, physical activity and diet) and psychological wellbeing. These metrics should also be included in national indicators.

Recommendation 2:
The Department of Health should explore with NICE the explicit identification of the impact of clinical and public health interventions on overall life expectancy and on health expectancy, and quality of life for people with disability and long-term conditions. NICE should produce rankings of the most cost-effective clinical and public health interventions, with an expectation of delivery of the most cost-effective. The feasibility to provide assessments of cost impact and return on investment should also be explored.

Recommendation 3:
The impact on health expectancy should be used explicitly to judge the benefits of new policies that impact on health and wellbeing.

4. Lifestyle Interventions and Mental Health

> ***It is important that clear priorities are stated for health and wellbeing. This should start with the biggest lifestyle influences on population health: tobacco, alcohol, physical inactivity and poor diet.***

Four specific lifestyle factors (tobacco, physical inactivity, excess alcohol consumption and poor diet) are among the biggest contributors to most preventable disease, across all social groups and in all areas of England.

These four factors have been selected, in part, since return on investment and cost-effectiveness in these areas make them attractive for initial focus. The prioritisation of the top four was also cognisant of areas otherwise covered by work on long-term conditions. While we propose that the focus should be on these four, we also consider other behavioural risk factors to be vitally important.

The 'top four' of tobacco, physical inactivity, excess alcohol consumption and poor diet are responsible for 42% of deaths from leading causes,[7] and approximately 31% of all disability-adjusted life years (DALYs).[8] Together they account for at least £9.4 billion in annual direct costs to the NHS.[9]

UNITED KINGDOM					
Deaths			DALYs		
	Risk factor	% of total		Risk factor	% of total
1.	Tobacco	24.3	1.	Tobacco	14.2
2.	High blood pressure	19.4	2.	High blood pressure	8.6
3.	High cholesterol	13.3	3.	High cholesterol	6.9
4.	High BMI	8.0	4.	High BMI	6.3
5.	Physical inactivity	5.5	5.	Alcohol	5.2
6.	Low fruit and vegetable intake	4.0	6.	Physical inactivity	3.1
7.	Occupational airborne particulate matter	0.6	7.	Illicit drugs	2.6
8.	Urban outdoor air pollution	0.6	8.	Low fruit and vegetable intake	2.2
9.	Unsafe sex	0.6	9.	Unsafe sex	0.8
10.	Illicit drugs	0.4	10.	Occupational airborne particulate matter	0.6

Deaths and DALYs attributable to the 10 leading causes of death in the WHO European Region, 2002. *The European health report: Public health action for healthier children and populations*, World Health Organization Europe, modified by authors.

If expenses incurred outside the NHS are included, these figures rise further. The social costs of alcohol amount to between 1% and 3% of GDP – estimated at £20 billion per annum;[10] costs attributed to poor diet (cardiovascular disease, diabetes, cancer, dental caries, digestive diseases) stand at £6 billion per annum;[11] and costs due physical inactivity at £1 billion.[12] The direct costs of smoking stand at £5.2 billion per annum,[13] not inclusive of the 34 million working days lost to British industry every year from smoking-related sick leave.[14]

The above figures illustrate the cost of the do-nothing scenario. In fact, projected future costs are higher, associated with all four major lifestyle factors. There will be an increasing burden of cost.

A 0.4% per annum reduction in smoking prevalence has been linked to £13 million[15] savings by 2010/11 through reduced emergency admissions for acute myocardial infarction and stroke. Reduction in length of stay and waiting times from pre-operative smoking cessation would provide net savings of £25 million after one year, and savings at this level would be anticipated for at least the first three years.[16]

It is calculated that brief interventions for alcohol misuse in a primary care setting reduce GP consultation and secondary treatment costs by £50–75 million after one year.[17] A reduction in problematic alcohol drinkers has the potential to reduce alcohol attendances at accident and emergency units by 4% in one year.[18]

Overall savings can be anticipated for a range of interventions linked to diet and exercise over the longer term. The Organisation for Economic Co-operation and Development (OECD) is presently working on a model of obesity prevention for the UK, in collaboration with the UK, providing estimate savings for a range of interventions.

Psychological health is, in many instances, a fundamental determinant of health. Mental health is linked to lower employment levels (estimated to cost £26.1 billion per annum),[19] and early intervention in mental health has been found to save between £64,000 and £150,000 per case through initiatives to address conduct, emotional disorders and social and emotional skills.[20] Recent thinking suggested purpose and rationale for government intervention to improve wellbeing and happiness;[21, 22] and quality of life is associated with mental wellbeing.

Investment in prevention increases the number of healthy years lived, and such investment is generally cost-effective.[23] However, we note the lack of consistent and high-quality data on the broader social effects across lifestyle diseases, and a paucity of information on governmental and NHS payback times on investment in health improvement and wellbeing. Strengthening of the evidence is of critical import.

Prioritisation within lifestyle factors, and within health and wellbeing, has been considered on the basis of currently available information. Where work is ongoing to determine the relative financial impacts and returns on investment for interventions (such as analysis of contributions to all-age all-cause mortality), this should inform future prioritisation.

The effect on important areas of health and wellbeing policy not included in this top list has been considered. The gains to be made from having health and wellbeing focus clearly, as a first priority, on a limited number of areas was judged to be substantial and worthwhile. The aspiration would be for commissioning and prioritisation to deliver against these areas, and for attention then to be turned to other issues.

5. Long-term Conditions

> ***Prevention of the onset and deterioration of long-term conditions will yield significant gains for health in the population; it is, however, vital that the current focus on risk factors is complemented by policy to address common underpinning social determinants.***

Prevention of the onset and deterioration of long-term conditions encompasses a broad range of preventative interventions, and establishment of the priority areas for work on long-term conditions has been undertaken within the Department of Health. The Department considered:

- information on prevalence;
- disease severity and mortality;
- NHS expenditure;
- optimality of treatment; and
- quality of years lost.

Five high-impact groups were identified: circulatory conditions, respiratory conditions, mental health conditions, musculoskeletal conditions and cancers.

This report will not duplicate the dedicated work on long-term conditions already in development, but it does emphasise the extent to which behavioural risk factors and health and wellbeing are core to preventing and reducing the severity of long-term conditions. Tackling behavioural risk factors is often seen as an issue among younger, predominantly healthy people, but behavioural factors are also major risk factors in the onset and relapse of, and premature mortality from, long-term conditions such as diabetes, cardiac disease and respiratory disease, and for increased disability from musculoskeletal conditions and mental ill health. There is also strong evidence that reducing behavioural risk factors in older people significantly increases both quality and length of life, irrespective of any pre-existing long-term condition. With ageing of the population, it is critical that we have a strong focus on improving health and wellbeing in older people.

Physical activity is a powerful example. Diet and exercise have been found to reduce the relative risk of diabetes by 37%.[24] Unplanned care costs and costs of poor downstream management of long-term conditions are dramatic and have large negative effects on the local health and social care economy. The cost-effectiveness of behaviour change is stark in comparison.

The authors seek, additionally, to emphasise the current imbalance in investment in health services. Investment in health services has been skewed towards the final year of life, while opportunities to prevent, delay the onset or reduce the severity of disease have, in comparison, been poorly grasped. There is the potential to shift investment in long-term conditions, where the industrial-scale application of effective preventative interventions would draw finance to the prevention side.

We believe that policy on long-term conditions should incorporate a strong sense and consideration of those people who are affected by multiple environmental and individual risk factors.

Statistical modelling of individual categories related to prevention – fruit and vegetable consumption, drinking, smoking and recreational activity – has indicated that characteristics vary consistently in association with a combination of social determinants (increasing prosperity, social capital and positive mental health).[25]

Social determinants highlighted in the pending Strategic Review of Health Inequalities in England Post-2010 (Marmot Review) should be integrated, where pertinent, into long-term conditions policy.

Section 2 Recommendations to Enable Effective Delivery

6. Strengthened Cross-government and Department of Health Action on Health and Wellbeing

Health and wellbeing requires stronger policy coordination across government and within the Department of Health.

Actions to improve health and wellbeing are frequently undertaken outside the NHS, and mechanisms to ensure cross-government action sometimes appear to lack the impact needed to be most effective.

Physical activity is illustrative, as there is good evidence that it is affected by the physical design of schools, school travel plans, the design of the built environment, the extent to which transport infrastructure encourages physically active travel, access to the natural environment, access to leisure facilities, and interventions in the workplace. It also has beneficial impacts on health and wellbeing at all ages, on educational outcomes and on economic productivity.

Strong health and wellbeing delivery through government departments requires greater understanding of health and wellbeing and its contribution to wider community prosperity, and the actions needed by different government departments to improve health and wellbeing. Other departments' specific delivery responsibilities would be clearer, particularly where action is the collective responsibility of several departments.

This requires strong advocacy and policy coordination across government. The Department of Health should invest in measures to strengthen the expertise and understanding within other government departments and agencies of health and wellbeing, as well as its contribution to wider community prosperity. The aim should be for all government ministers and departments to feel that they have a major stake

in health and wellbeing, and in promoting it through their own policies. Hence, while the Department of Health would have a leadership role, health and wellbeing would be recognised more strongly as an issue for all government departments.

Stronger and more innovative mechanisms should be created to promote cross-government actions to improve health and wellbeing. There should be a genuine ability to influence the actions required of different government departments and to promote integrated commissioning, arrangements to encourage greater shared ownership and accountability for delivery of actions, and recommendations for future shared public service agreement arrangements.

However, we are uncertain of the most practical way to achieve a strengthening of arrangements at a national level, and believe that ministers and other senior officials within the Department of Health will have a better view of what will work. We believe that a range of options may be appropriate, from time-limited cross-government working groups to advise on individual aspects of health and wellbeing policy, to models such as the new national safeguarding delivery unit (NSDU), which supports action to improve children's safeguarding.

Government Offices also have a clear role to facilitate integrated approaches across departments at a regional level.

Recommendation 4:
Stronger and more innovative mechanisms are needed for cross-government actions to improve health and wellbeing, including mechanisms to identify the role of different government departments and their delivery systems.

Effective implementation of health and wellbeing initiatives needs coordinated action at a local level across all NHS activities, as well as in partnership with other public sector bodies. To support this, it would be helpful to identify – at a national level – the evidence for effectiveness and the economic case for action, metrics for judging success, and the means of delivery through world-class commissioning and action across the public sector.

This could be reflected in improved coordination across the Department of Health, with input from teams working on health improvement and protection, NHS workforce, social care, primary care, world-class commissioning, system management, local and regional partnerships, inspection and standards. A single team with a single point of leadership may be an appropriate mechanism.

We have found the national support teams to be extremely valuable in supporting practical local delivery of health and wellbeing outcomes. Their experience should be used to ensure that national approaches are grounded in the reality of delivery, informing the national coordination of policy and expectations of the delivery system.

All current inspection processes should emphasise the importance to the NHS of prevention. The Department of Health should aim for inspections to be coherent and, where possible, aligned so that front-line organisations can set priorities on a consistent basis. We recommend alignment of the world-class commissioning and comprehensive area assessment processes.

Recommendation 5:
A single point of leadership should be considered within the Department of Health, able to draw on expertise across the Department, with the role of ensuring strategic coherence in all areas of health and wellbeing policy and delivery. The experience of national support teams should be used to strengthen this work.

Recommendation 6:
Local health and wellbeing goals should be articulated and reviewed consistently and together within a single approach to inspection.

7. Integrated Commissioning Model for Health and Wellbeing

> ***Existing commissioning systems should be built upon to deliver health and wellbeing outcomes in a more powerful and systematic way.***

We propose that the policy actions identified through the strengthened arrangements across government and within the Department of Health should be implemented through a new integrated local commissioning model for health and wellbeing. This needs to identify explicitly how the NHS and local partners commission jointly to deliver improved health and wellbeing, building on strengthened local joint strategic needs assessments. The specific roles of primary care and different sectors of the NHS, social care and other local authority services, and other public sector partners are key in ensuring effective delivery, as is the role of local area agreements and other partnership arrangements in supporting integrated action on health and wellbeing. We envisage this integrated commissioning model being driven by local strategic partnerships, with localised health and wellbeing strategies and delivery plans being developed in response to local needs.

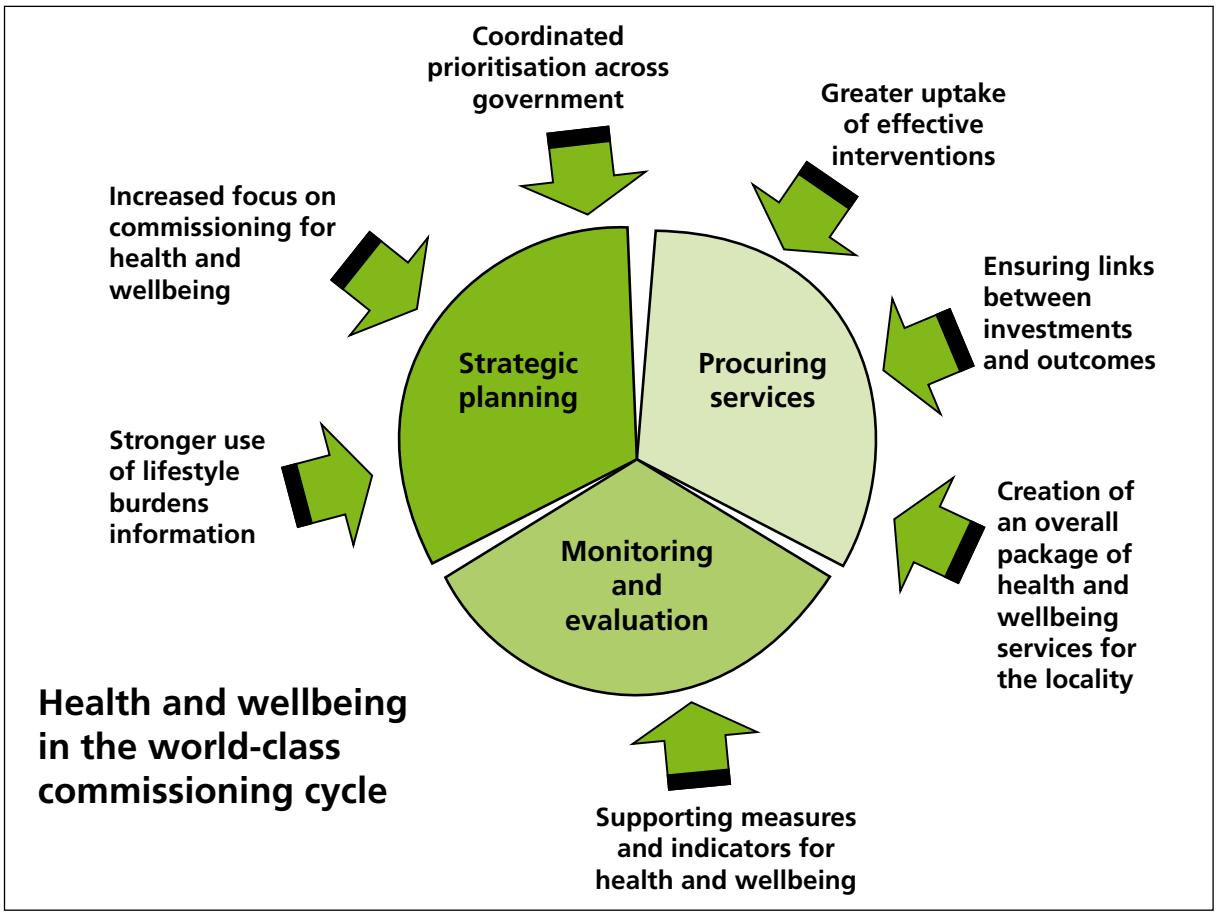
The vision is that the quality of integrated commissioning would be enhanced at each stage of the commissioning cycle. To assist in this, the national support package offered to assist localities would include improved modelling of lifestyle burdens for primary care trust (PCT) and local authority areas, support for needs assessment (for example, through a needs assessment tool), tools to tailor NICE guidance on health and wellbeing to local populations, more robust information on links between investments and outcomes, and a supporting basket of indicators for health and wellbeing.

The integrated commissioning model for health and wellbeing would aim to ensure that eight objectives are pursued:

1. Increased focus on commissioning for health and wellbeing.
2. Coordinated prioritisation across government departments for health and wellbeing.
3. Joint commissioning and planning of services by local partners.
4. Stronger use of lifestyle burdens information, feeding into health needs assessment.
5. Greater dissemination and uptake of effective interventions.
6. Creation of an overall package of services for each locality that meets levels of lifestyle burdens.
7. Development of supporting measures and indicators on which to assess performance improvement.
8. Ensuring clear links between investments and outcomes.

Leadership and development of the commissioning model should be an inclusive process, driven by practitioners from the front line. This model should, as a priority, be applied to the 'top four' lifestyle issues, mental health, children's health and the prevention of long-term conditions. This should build on existing joint strategic needs assessments and joint commissioning guidance such as that articulated for children in *Securing better health for children and young people through world class commissioning*.[26] The aim should be to deliver against levels of aspiration and opportunity at the local level for health and wellbeing.

Specific steps to achieve the integrated commissioning model include:



1. Production of a guide on how best to ensure effective commissioning through the use of the integrated commissioning model.
2. Department of Health provision of modelling of the burden of lifestyle factors for each primary care trust and local authority area.
3. A needs assessment tool, which combines lifestyle burden data with evidence of effective interventions, to be used at local level to determine the packages of interventions required to address prevention. This should allow each PCT and local authority to identify the interventions that are appropriate to their demography and the scale of specific services they should commission, and should be used as part of a joint strategic needs assessment.
4. Provision of a basket of indicators to support local services and assist with monitoring and assurance of delivery. This basket of indicators to support integrated commissioning of health and wellbeing should be consistent across the vital signs, national indicator set for local area agreements, Joint Area Review, and Care Quality Commission processes.

Strong leadership across the local public sector is needed to ensure integrated commissioning of health and wellbeing. Integrated leadership development programmes will support this strengthened delivery.

Recommendation 7:
A new integrated commissioning model for health and wellbeing should be developed to improve health and wellbeing outcomes. This model should, as a priority, be applied to the 'top four' lifestyle issues, children's health, and prevention and effective management of long-term conditions.

Recommendation 8:
We recommend the development of integrated public sector leadership development programmes at the local level to ensure delivery of improved health and wellbeing.

Objectives for health and wellbeing in NHS world-class commissioning cycle, 2009

Department of Health (2009), *World Class Commissioning*, DH diagram; amended by authors.

8. Integrated Public Sector Delivery at a Local Level – with a Particular Focus on Children

Fragmentation is particularly noticeable in services for children, despite the critical importance and influence of health and wellbeing in the early years. Children's trusts are an important basis on which to build integrated commissioning, a joined-up view of the children's workforce, and collective purpose.

Health and wellbeing can, and should, be clearly seen as the foundation for societal prosperity and as providing inputs to a flourishing society.

It is, for instance, an input to educational attainment, through reduced depression, anxiety and teenage pregnancy. Improvements in skills and employment are gained through better levels of self-esteem and aspiration.

There are, however, systemic barriers to forming policy across sectors for single population groups – whether defined as communities of interest or by geographical location. In both cases, the key issue is a need to simplify and strengthen focus on those groups and places where investment and reform will have the greatest impact.

Tackling major health and wellbeing issues requires aligned approaches between public sector partners. Strong PCT and local authority partnerships are a foundation for such intensively integrated services. Joint ownership of the Children and Young People's Plan by both the PCT and the local authority is a welcome development, and an important platform for delivering through partnership.

Obvious steps should be taken to establish organisational incentives for collective purpose. It is the authors' sense that local area agreements should be given sufficient time to bed down and consolidate partnership working, and that the alignment of supporting performance frameworks is required between the NHS vital signs and the national indicator set. This aims to move towards collective work for collective rewards and cross-cutting targets.

Barriers have also been noticeable in the case of planning regulations. Enhanced focus is needed at government level to secure maximum health gain from planning. This should particularly address regulations that permit obesogenic environments (such as those environments with a high density of fast-food outlets) and environments not conducive to physical activity. Planning that facilitates walking and cycling is of particular importance. This is a topic where improvements would help multiple local partners achieve healthy places and reduce inequalities in health.

Other local barriers to integrated and coherent working may be identified through the current Total Place pilots. These will look at where barriers to integration can be dismantled. In particular, those pilots that address alcohol, child obesity, teenage pregnancy and child health must be of major import. These pilots will provide feedback to the Government in autumn 2009 on local barriers to delivery and potential opportunities to align services. They will only have the desired impact if they

are evaluated in a way that provides a basis for systematic cost–benefit analysis of interventions. This is a major opportunity to seek systemic integration and motivation for communities to address resilience and achievement in health and wellbeing.

There is an undoubted correlation between the health and life chances of a child in its early years and its future wellbeing, morbidity, mortality and ability to engage to the best of its ability in society. The period between birth and 5 years of age is critical.[27] Ill health or harmful lifestyle choices in childhood can lead to worse health status throughout life, and create ongoing negative individual and social effects.[28]

There is increasing momentum (through the Children's Plan,[29] the Marmot Review,[30] the World Health Organization's *Closing the gap in a generation*,[31] and evaluation of children's centres[32]) for recognition of the crucial nature of multiple-agency interventions for 0–5s. Joint policy between the Department of Health and Department for Children, Schools and Families includes the child health strategy, *Healthy lives, brighter futures*[33] and the *Healthy Child Programme: Pregnancy and the first five years of life*.[34]

There are loud calls for better coordination across agencies, the development of models of services for this age group, and emphasis on holistic 'family' thinking to prevent physical, social and mental developments that are difficult to remedy later.

There is not a single, coordinated link to each child under the age of 5, and minimal interventions are currently mandatory for this age group. As a result, current chances to intervene on a holistic and cross-cutting prevention agenda are not maximised.

Children's access to interventions to promote their wellbeing is patchy, and under the age of 5 (when school attendance becomes compulsory) is most often dependent on parental engagement. This frequently leads to a situation where the children most in need of health and wellbeing assistance do not receive it, as their parents are the least engaged.

It is possible for the platforms for intervention currently available, such as children's centres, to be further developed. This recognises the fact that pockets of deprivation exist alongside whole areas of deprivation. Children's centres are seen as a valuable potential health and wellbeing platform from which to engage with parents and raise their wellbeing, their aspirations for better physical and mental health for their children, and better outcomes for their families.

We are of the view that a strengthened children's workforce, with better integration between professions, such as health visiting and social care, is needed to underpin interventions for children up to the age of 5 across a geographical area. One possibility that could be considered is a new profession of children's worker, integrating health and local authority roles.

People in the children's workforce need to be skilled in signposting health and social support, parenting skills, wider skills, and support services where necessary, intervening assertively when required, and providing cross-agency coordination and expertise in early years support. The authors welcome the targeted approach to public sector intervention for 0–5s where this is needed, such as in the Family Nurse Partnership Pilots, with their greater emphasis on parenting skills. We consider that the learning gained from these pilots needs to underpin the development of the children's workforce.

For the public sector to systematically assist those with greatest needs, better data on children is required. Sweden operates a system where a single national identifying number – used across all partners – enables all services to know from birth where children are living, and to record information on what services are being accessed for that child. This allows monitoring of children, with intervention scaled to level of risk.

At present, England has two relevant information systems available. The first system, ContactPoint, is a universal database, which holds basic information and operates as a directory for professionals who need to know who else is working with the same child. The success of this potentially extremely valuable system hinges on the commitment of professionals to enter a record when contact is made with a child. To date, in very many geographical areas primary care trusts, health practitioners and managers have had limited engagement with their local authorities, and there is a need to improve healthcare worker recording on the system. Greater partnership work must be undertaken so that the database is well populated and at-risk children are more likely to be detected through the system. There is also a need for commitment to ensure effective use of ContactPoint by practitioners in health settings.

The second system is the electronic enablement of the Common Assessment Framework (National eCAF). CAF is a tool to support early intervention and integrated front line service delivery for children and young people with additional needs, where those needs are not being met by their current service provision. It is a process through which practitioners assess needs, identify what services need to be involved in meeting those needs and what interventions are appropriate. The process takes place with the involvement and consent of the child, young person and/or family. National eCAF is due to be rolled out to early adopters from spring 2010.

Consistent use by health professionals of both these systems would promote safeguarding and enhancement of children's health and wellbeing.

We also consider that increased support for delivery through general practice at a local level would be of benefit. Steps that could support this include consistent training for all GPs on health and wellbeing in children, better data sharing, shared incentives through alignment of vital signs and national indicator set measures, and joint training on basic skills and understanding of health and wellbeing, recognising the importance of motivation and behaviour change skills. Language to describe the health and wellbeing agenda needs to be inclusive and overtly aim to avoid alienating key partners in the delivery of health and wellbeing.

Recommendation 9:
We recommend strengthening the integration of the workforce for children's health and wellbeing, reflecting an emphasis on health and wellbeing outcomes, early intervention, and intensive case management wherever needed.

Recommendation 10:
We recommend stronger support and encouragement for NHS staff to record their involvement with children on ContactPoint, and to use it to support their practice in working with other practitioners, as well as to assist child protection.

9. A Renewed Vision for Primary Care and General Practice

The role of general practice is fundamental to promoting prevention. It is acknowledged that GPs' unique role and level of access to the population can allow for improved case management, self-care and coherence across the public sector.

Primary care has a key role to play in improving health and reducing health inequalities. General practice can build from its strengths as the main point of contact between the public and the NHS to reduce the likelihood of ill health and reduce health inequalities.

While health and wellbeing requires action across the whole public sector and government, the role of general practice is fundamental to prevention at an individual and a community level. It is acknowledged that its unique role and access to the population can allow for improved case management, self-care and coherence with other local professionals.

We would recommend enhancing the role of GPs in supporting change in behavioural risk factors and mental wellbeing. There needs to be provision of weight management services appropriate to children and their families, as well as to adults, interventions to improve diet and physical activity, support to stop smoking and to drink within sensible limits, and psychological therapies.

To ensure services meet evidence of best practice, we consider that a list of approved health and wellbeing services should be developed locally. Inclusion of health and wellbeing services in Choose and Book would promote referrals and intervention on issues of health and wellbeing.

We consider that models for general practices should be explored in which the 'deal' for signing on with a particular practice includes the GP assertively addressing behavioural risk factors with patients – akin to the approach taken by some health maintenance organisations in the USA. This could be identified explicitly as a reason for patients choosing their GP. It should be supported by the development of tools to identify the reductions in healthcare expenditure that will result from reductions in behavioural risk factors in the practice population (such as smoking), in order to illustrate the potential savings to practice-based commissioning budgets.

Systematic approaches to early intervention on risk factors and to secondary prevention to support improved wellbeing in people with long-term conditions is also vital. The role of general practice in targeted case finding and proactive management of major long-term conditions should be strengthened. This, and improved support for self-care, has the potential to save considerable health and financial costs of acute and secondary care, by bringing about a reduction in complications and emergency admissions.

We are concerned that the Quality and Outcomes Framework does not offer an incentive to provide care for the whole population (reflected in the targets for many quality indicators to cover 70% or 80% of the practice population). While we understand the rationale, the most needy, with the poorest health and wellbeing, are significantly over-represented in the other 20% to 30%. We are not sure of the best solution to this, but we consider that primary care professional groups, including the Royal College of General Practitioners, the NHS Alliance and others, should be invited to co-produce a renewed vision for primary care, including the role of primary care teams in both the individual health of their patients and the health of the communities that they provide care for.

Primary care quality is also paramount. Interventions based on the medical model, particularly for blood pressure and cholesterol, have large-scale impacts on prevention if implemented systematically. There has, however, been a failure among those potentially most in need and disadvantaged to become engaged in the process and for provision to be made to control their risk factors. Moreover, there is a rationale for any transformation of the system to focus on supporting people to stay healthy, with very early intervention on potential risk factors, in addition to case management. Recording and intervention on body mass index, diet and nutrition, levels of physical activity and tobacco use should be a priority for general practice. Intervention on the 'top four' lifestyle risks should be financially incentivised for the whole of a practice population, and incentives should increase for those patients who are most difficult to engage with.

GPs' training should be carefully considered to increase their skills for health and wellbeing, such as the ability to undertake brief intervention and motivational training. The weakness of the current training in paediatric issues should be rectified, in view of the critical import of this link to families, particularly those in vulnerable or disadvantaged groups.

This view has also been reiterated in recent consideration of the role of the doctor by the Royal College of Physicians: working group recommendations on outreach and education recommended that 'doctors could and should do more to outreach to socially disadvantaged and marginalised communities and groups; engage more in, and promote, health education; and improve the public health component of individual consultations'.[35]

GPs have a role in driving partnerships for prevention, with bespoke packages of public service intervention and effective practice-based commissioning. Practice-based commissioning should place an emphasis on GPs working with other contractors, having a key role to play in coordinated services for positive impacts on people and places at the neighbourhood level. Through their practice populations, GPs can provide a cornerstone for holistic and integrated public service engagement with local populations.

Supporting people to stay healthy with intervention on behavioural risk factors will not be possible without improved skills at the practice level, reflected in enhanced roles for nursing, pharmacist and other practice staff. Amended or enhanced roles for nursing, pharmacist and practice staff may be crucial to achieving strong multi-disciplinary teams at ward and practice-population level, equipped to provide holistic and integrated public service engagement with local populations. Provision should include the ability to navigate people to services, promote case finding, signposting and self-care.

Availability of GPs in those areas with consistently low numbers of GPs per 100,000 population remains an important factor in the quality of the health and wellbeing services that can be achieved for the population.

Recommendation 11:
A renewed vision for the future role of general practice needs to be developed in consultation with the Royal College of General Practitioners, the NHS Alliance and other key partners.

Recommendation 12:
The Choose and Book system should be expanded to offer GPs the option to refer to health and wellbeing services. A directory of approved services for the major behavioural risk factors and psychological therapies should be developed; this would point GPs and other health professionals to where evidence-based services are available.

Recommendation 13:
Tools should be developed that enable practices to understand the business case for improved health and reduced costs of healthcare by addressing behavioural risk factors in the practice population. These will support practice-based commissioning and underpin a potentially assertive model of practice intervention.

Recommendation 14:
The role of general practices in targeted case finding, proactive management of long-term conditions and support for self-care should be prioritised and supported through commissioning arrangements.

10. Focusing the NHS on Prevention

The NHS needs to be strengthened in its role as a health service rather than a sickness service, and needs to promote health and wellbeing by staff and other public sector bodies. To do this a culture change is needed towards better 'NHS Prevention'. Stronger corporate emphasis, incentives, staff skills and knowledge should be particularly emphasised.

There is a strong commitment across the NHS to improve health and to be fully engaged in prevention, as well as treatment. However, there is still a gap between this commitment and the rhetoric that accompanies it, and the practical reality of NHS performance and delivery. The profile of prevention should be improved across the NHS. The Wanless reports identify the importance of prevention and engagement of the population in their own health to ensure long-term sustainability of the NHS, and currently prevention and cross-public sector initiatives are insufficiently elaborated or prioritised through the Quality, Innovation, Productivity and Prevention process.

Awareness of main health and wellbeing drivers (such as vital signs and key performance aims) is limited across the front line. This feeds a tendency for the NHS to see this as a broader environmental and social problem. Individual professional staff, in line with the overall culture of the NHS, default to focus on performance measures related to clinical interventions.

The organisational goals for NHS Prevention should be clearly articulated (such as increased referrals across the organisation to NHS Stop Smoking Services) and awareness of them promoted. Additionally, NHS staff need assistance in identifying their individual roles in improving prevention.

Within secondary care, the payment system provides little impetus for NHS staff to contribute to prevention. For example, hospital hand clinics dealing with broken bones from alcohol-related injury have no incentive to provide prevention advice or to refer to alcohol treatment services. A recent study showed that patients at an acute hospital are routinely asked whether they smoke, but it is rare for support to be offered to help them stop, even though nurses want to be able to help and patients expect to be offered support.[36] These are clearly missed opportunities. Mobile services and outreach services set up by secondary care are also limited by the rewards and incentives, despite the fact that hard-to-reach groups need broader outreach services in a different delivery system model.

There should be consideration by the Department of Health of introducing contractual incentives into secondary care to maximise brief interventions, referral and opportunistic intervention. There should be an incentivised tariff to inform trusts how much to pay for the provision of preventative services.

We wish to re-emphasise the Boorman Review's interim findings that all NHS professional staff should have a good understanding of staff health and wellbeing issues, and that there is a need for improved education in staff health and wellbeing.[37] We believe the NHS could be an example in this area, but also that increased staff awareness of health and wellbeing will have additional benefits for patients and the wider public.

Current pilot programmes in secondary care are showing the remarkable effects that NHS staff training and development on brief intervention, referral and opportunistic intervention can have on public health outcomes.[38] Often, there are barriers in perception: the most common reasons why staff do not undertake more brief interventions include lack of time, feeling unable to convince a patient to improve their lifestyle, worries that patients will take the advice badly, or recognition that they themselves exhibit behavioural risk factors of concern. Training can address the knowledge and skills needed to undertake brief interventions, and improve the willingness to intervene. It would be valuable to have a set of examples of practical ways of supporting people to alter their lifestyle through the training of all healthcare professionals.

Organisations other than the NHS have a very great influence on the determinants of health, major links to the public and control of the training of public sector staff. These opportunities should not be neglected, and local areas should aim to develop joint programmes to increase skills for prevention.

Consideration should be given to an accreditation scheme that rewards levels of staff training, organisational engagement in health and wellbeing, and strategic leadership on this agenda. The accreditation should also be relevant and available to other public sector bodies, particularly local authorities, where staff training and access to hard-to-reach groups are valuable.

A fundamental understanding of the importance of behavioural risk factors to levels of illness, causation of illness and the contribution to likely ill health and low quality of life should be core to all professionals' education. That would provide a grounding on which leadership on this agenda and broad NHS recognition of the importance of prevention can be based.

Skills are needed across the NHS and the public sector on behaviour change, improving motivation, understanding of health and wellbeing, confidence and ability to undertake brief and opportunistic intervention and referral.

Consideration should be given to the idea of an award to recognise that an NHS or other public sector body has achieved a certain level of staff training and engagement in health and wellbeing.

This is a large agenda. Coordination of training across front-line staff (including health and wellbeing activity across secondary care), improving employee health, seeking accreditation and realising senior stakeholder engagement will need dedicated and systematic effort.

We consider that it is possible to develop a service – which could be called 'NHS Prevention' – that will help translate into reality the aspirations for NHS staff to address health and wellbeing into reality. This was identified as a priority in the NHS Next Stage Review, but the model for implementation has not been consistently identified. Each PCT would draw up its directory of approved services for health and wellbeing, as identified in recommendation 12.

Health trainers (or health advocates), trained in supporting people to change behaviour, would work with individuals and help them address these risk factors, referring to services, as appropriate, from the directory of approved services. The health trainers (or health advocates) would include people based within communities (such as the currently prevailing health trainer model, targeted on the most deprived communities), but the model could be extended so that existing staff could develop this role – for example, nurses or other staff within practices, staff on acute hospital wards or within mental health services. This would act as a professional development to existing staff roles, and trusts and practices could identify this service as a reason to choose their hospital or service for care.

'NHS Prevention' developed in this way could support changes to behavioural risk factors in patients with other health conditions, such as heart disease, and form part of the range of interventions available following NHS life checks. The health advocates could champion and offer support to other NHS staff to improve their own health, and therefore contribute to future work based on the interim report of the recent review of health of the NHS workforce by Dr Steve Boorman. The model could also be extended to social care and public and private sector employers, to improve the health of their staff.

While the business case to support this model needs to be fully worked up, we consider it likely that there is a strong case for developing the model for 'NHS Prevention' on the basis of an extension and development of existing staff roles, given existing evidence of the high cost-effectiveness of reducing the major behavioural risk factors for health, and of improving psychological wellbeing.

Recommendation 15:
The model for 'NHS Prevention', and the business case to support it, should be developed urgently, as a means of embedding health and wellbeing further into the culture of the NHS.

It is the authors' view that these proposed changes to delivery systems will significantly reduce barriers to the ability of front-line organisations to improve health and wellbeing.

Annex A: Summary of Recommendations

Summary of recommendations	
Priorities and objectives	**Recommendation 1:** **We recommend an overarching tier 1 vital sign to improve disability-free life expectancy (health expectancy), in addition to the existing vital sign indicator on life expectancy. This should be supported by tier 2 vital signs for local agreement on the four major lifestyle factors (smoking, alcohol, physical activity and diet) and psychological wellbeing. These metrics should also be included in national indicators.** **Recommendation 2:** **The Department of Health should explore with NICE the explicit identification of the impact of the clinical and public health interventions on overall life expectancy and health expectancy, and quality of life for people with disability and long-term conditions. NICE should produce rankings of the most cost-effective clinical and public health interventions, with an expectation of delivery of the most cost-effective. The feasibility to provide assessments of cost impact and return on investment should also be explored.** **Recommendation 3:** **The impact on health expectancy should be used explicitly to judge the benefits of new policies that impact on health and wellbeing.**
Strengthened cross-government and Department of Health action on health and wellbeing	**Recommendation 4:** **Stronger and more innovative mechanisms are needed for cross-government actions to improve health and wellbeing, including mechanisms to identify the role of different government departments and their delivery systems.** **Recommendation 5:** **A single point of leadership should be considered within the Department of Health, able to draw on expertise across the Department, with the role of ensuring strategic coherence in all areas of health and wellbeing policy and delivery. The experience of national support teams should be used to strengthen this work.** **Recommendation 6:** **Local health and wellbeing goals should be articulated and reviewed consistently and together within a single approach to inspection.**
The need for a new integrated commissioning model at a local level	**Recommendation 7:** **A new integrated commissioning model for health and wellbeing should be developed to improve health and wellbeing outcomes. This model should, as a priority, be applied to the 'top four' lifestyle issues, children's health, and prevention and effective management of long-term conditions.** **Recommendation 8:** **We recommend the development of integrated public sector leadership development programmes at the local level to ensure delivery of improved health and wellbeing.**

Summary of recommendations	
Integrated public sector delivery at a local level – with a focus on children	**Recommendation 9:** **We recommend strengthening the integration of the workforce for children's health and wellbeing, reflecting an emphasis on health and wellbeing outcomes, early intervention, and intensive case management wherever needed.** **Recommendation 10:** **We recommend stronger support and encouragement for NHS staff to record their involvement with children on ContactPoint, and to use it to support their practice in working with other practitioners, as well as to assist child protection.**
A renewed vision for primary care and general practice	**Recommendation 11:** **A renewed vision for the future role of general practice needs to be developed in consultation with the Royal College of General Practitioners, the NHS Alliance and other key partners.** **Recommendation 12:** **The Choose and Book system should be expanded to offer GPs the option to refer to health and wellbeing services. A directory of approved services for the major behavioural risk factors and psychological therapies should be developed; this would point GPs and other health professionals to where evidence-based services are available.** **Recommendation 13:** **Tools should be developed that enable practices to understand the business case for improved health and reduced costs of healthcare by addressing behavioural risk factors in the practice population. These will support practice-based commissioning and underpin a potentially assertive model of practice intervention.** **Recommendation 14:** **The role of general practices in targeted case finding, proactive management of long-term conditions and support for self-care should be prioritised and supported through commissioning arrangements.**
Focusing the NHS on prevention	**Recommendation 15:** **The model for 'NHS Prevention', and the business case to support it, should be developed urgently, as a means of embedding health and wellbeing further into the culture of the NHS.**

Annex B: Terms of Reference

Following on from the Secretary of State for Health's speech on health and wellbeing of 19 March 2009, an independent piece of work has been commissioned in relation to health and wellbeing, specifically focusing on the prevention of ill health.

This work will cover three particular aspects:

- what the role of the state should be in relation to people's health and wellbeing, specifically focusing on the prevention of ill health;
- the lessons we can learn about influencing healthier lifestyle choices from fields such as behavioural economics, psychology and marketing; and
- what the Department and the NHS can do to enhance delivery of front-line services to improve people's health and wellbeing.

These three workstreams will report back to the Secretary of State, and are requested to cover the following content.

The role of the state

In the light of public attitudes and the perspectives of a range of leading thinkers:

- What narrative could we set out around the current role of the state in supporting people's health and wellbeing?
- What are the implications of public attitudes and the views of leading thinkers for our current approach?
- Where might the state do more, refocus or even do less? At what stage might the strongest forms of intervention – legislation and regulation – be justified? What would public/expert views be on this and how might we engage with the public/make the case for this?
- Provide advice on what our narrative on the role of the state should be in the future, and the policy implications of this.

Behaviour change

- Review the latest evidence and thinking on how to use insights into human behaviour to influence health choices and outcomes.
- On the basis of this, make a small number of recommendations about how the Department and the NHS could improve its approaches to health and wellbeing.

Enabling effective delivery

In the light of input from the front-line and recent evidence on which approaches work best (in terms of health impact and cost-effectiveness):

- Make a small number of recommendations on the future priorities for health and wellbeing.
- Make a small number of recommendations on what DH can do to best enable effective delivery on the front line.

Annex C: Consultation

This review held the following consultation events:

17 June 2009 Faculty of Public Health Conference, Scarborough
Workshop event with the specialist public health workforce, asking wide-ranging questions on where the barriers to delivery of health and wellbeing are at the policy and implementation levels.

16 July 2009 Tacit Knowledge Session with the Public Health Interventions Advisory Committee (PHIAC), National Institute for Health and Clinical Excellence, at the British Medical Association, London.
A seminar and dinner event discussing the current range of interventions for health and wellbeing, and their supporting evidence base. The seminar addressed the methods and rationale for prioritisation of public health interventions.

24 July 2009 Enabling Effective Delivery Seminar with front-line stakeholders, at the King's Fund, London.
Workshop and input on the key themes and proposed focus of the report, with front-line NHS, local authority, private sector and third sector stakeholders. A discussion of perceived problems with current delivery, articulation of barriers to delivering outcomes and joint working, and recommendations.

As well as these main events, the leads of this project sought views and met the following stakeholders:

David Nicholson, Chief Executive, NHS

Michael Dixon, Chairman, NHS Alliance

Steve Field, Chairman, Royal College of General Practitioners

Cross-government policy leads

Mike Kelly, Director, Public Health Centre of Excellence, NICE

Marmot Review Team, University College London

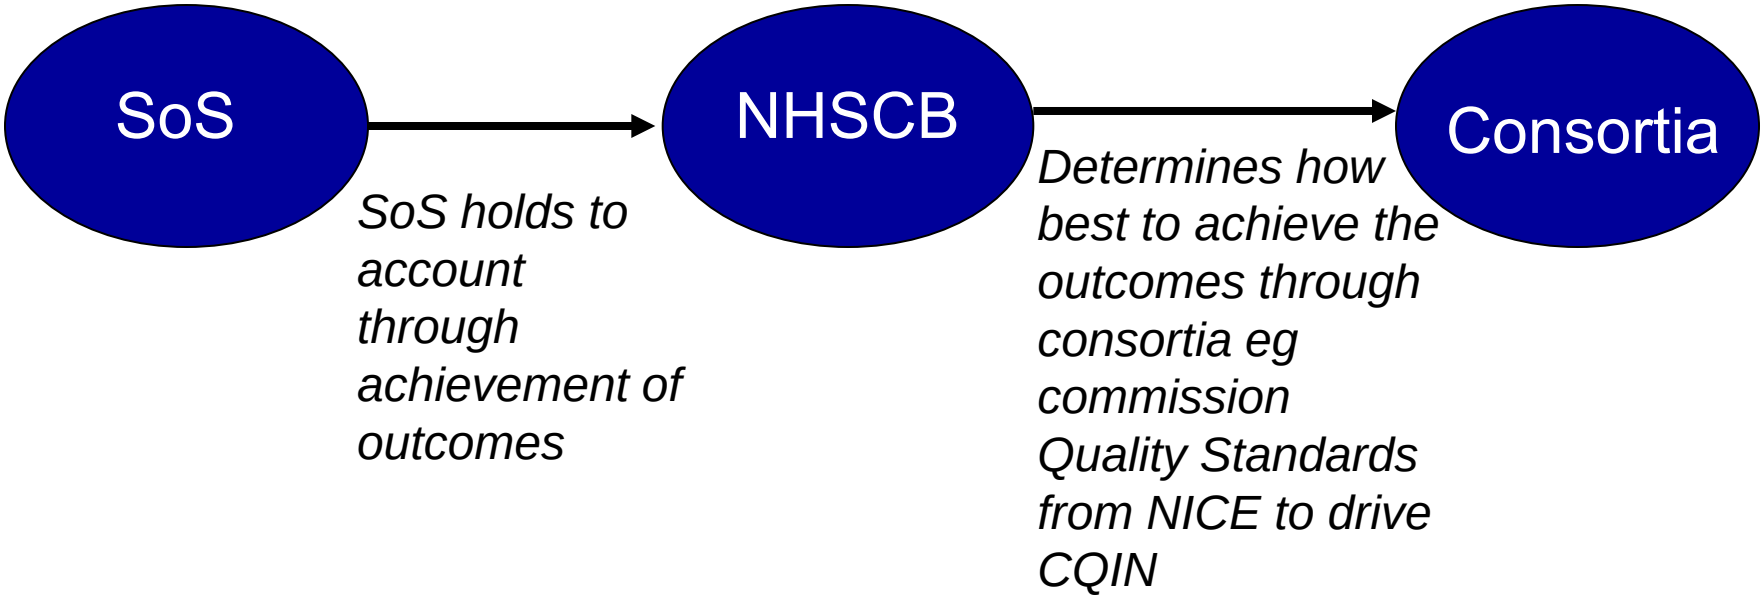
The health system in which marketing operates is changing……

Health White paper summary



The new health system

Source: Equity and excellence: Liberating the NHS

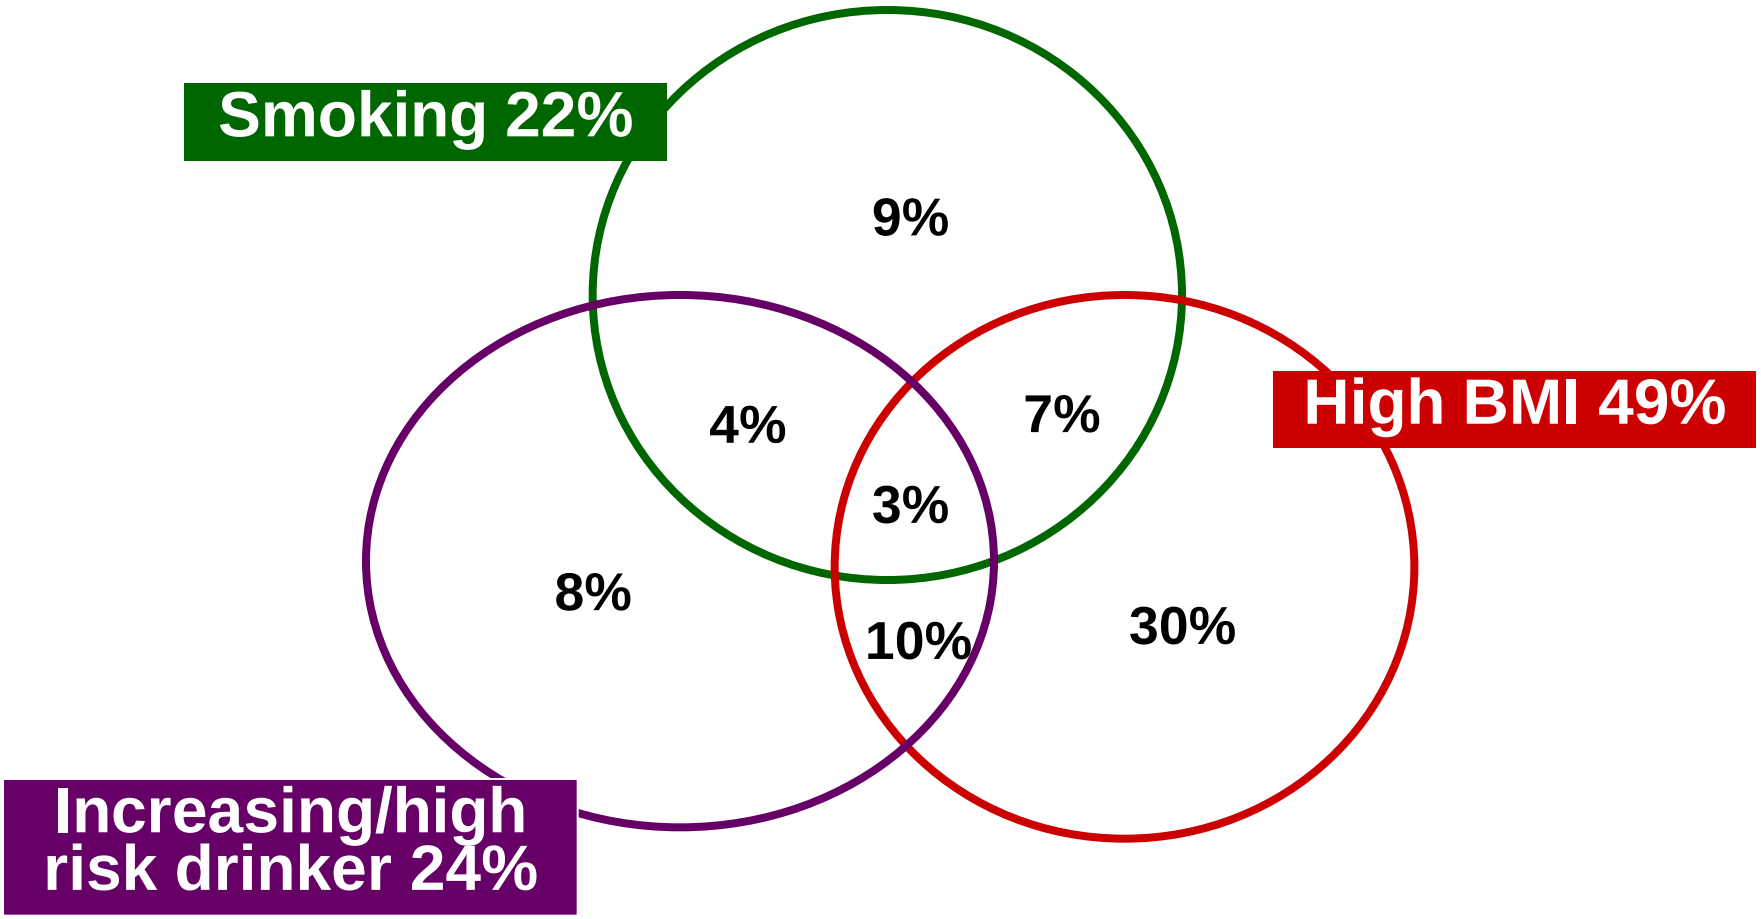
Targets are dead! but the outcomes framework may shape future marketing in much the same way as PSAs

Outcomes framework – DOMAIN 1: preventing early death

COI

Overarching Indicator
Frames NHS Commissioning Board's broader responsibilities

Improvement Areas Outcome Indicators
SofS holds NHS Commissioning Board to account for progress



Supporting Quality Standards
Support commissioning of high quality service

e.g. Mortality amenable to Healthcare

- **Heart disease**
  e.g. premature mortality
- **Cancer**
  e.g. 1 and 5 yr survival
- **Stroke**
  e.g. premature mortality
- **e.g. Children**
  e.g. infant mortality; respiratory disease
- **e.g. Older people**
  e.g. healthy life expectancy age 65

A suite of quality standards will support the delivery of improved outcomes in this domain

The relevance of poly behaviours

Base: Healthy Foundations - All respondents who do at least one negative health behaviour (unwtd 4909, wtd 4895)

The new government marketing agenda……

A new paradigm

COI

Big Government → Big Society

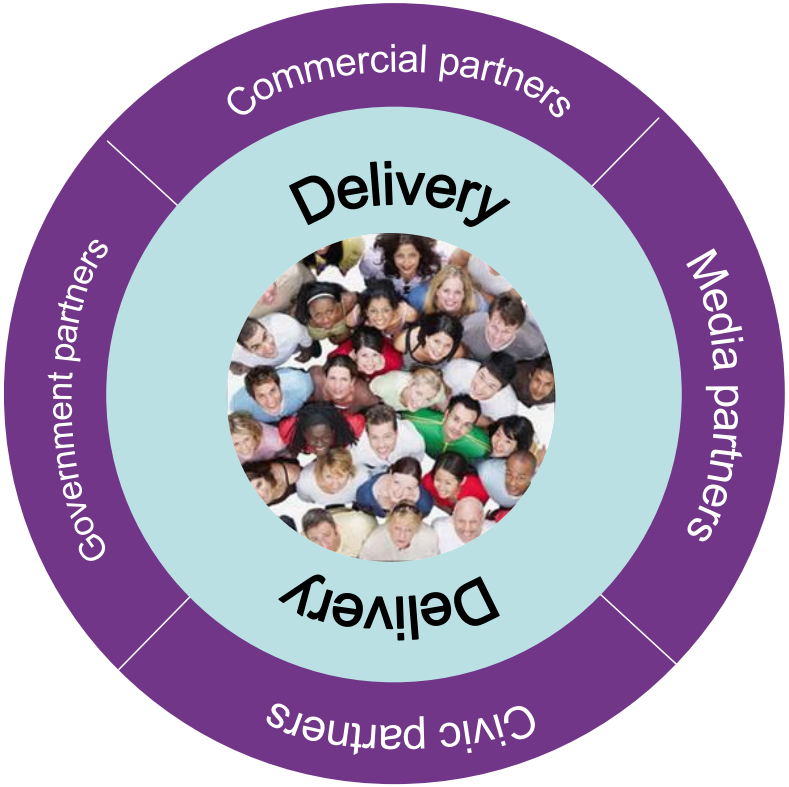
The Big Society is one in which we all try and do more. We don't just look to Government to solve the many problems that we have, we actually look to ourselves, to voluntary bodies, to companies, to charities, to all of those things to build a bigger, richer country

A changing role of Gov't marketing across a broader spectrum of needs and across time

COI

Responsibility: **Central Government** (National)	Responsibility: **Big Society** (Community)	Responsibility: **Individual** (Personal)
To direct (Necessary)	**To enable (Valuable)**	**To inform (Your choice)**

Government led objectives
Government as author
VFM scrutiny
Fewer, well-branded, coordinated programmes focusing on fewer strategic themes



Devolved responsibility
Citizen/partner led objectives
Collaborative, co-produced, flexible, transparent
Government facilitates, coordinates, partners and seed funds

A new paradigm for relationships

COI

From	To
Command and control	Collaboration
The passive citizen	Active participation
I invent I direct I do	I invite We invent We or you do

But how will society expand as government withdraws?

A new collaborative model to make Big Society happen

- Do more with less
- New incentives
- Using more subtle “levers”
- Tackling greater complexity
- Unproven

How can Marketing help?

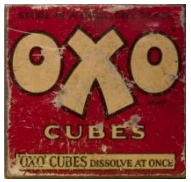
Marketing has evolved to become a process of empowering the consumer

COI

Marketing is about creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large

American Marketing Association

Conversation



Control

Provider

Persuader

Partner

Early 20C
Marketing is about providing products people need

1960s-80s
Marketing is about persuading people through messages

BRITISH AIRWAYS

1980s-2000s
Marketing is about making people feel one to one relationship

Now and the future ~
Marketing is about engaging with and mobilising audiences as an equal

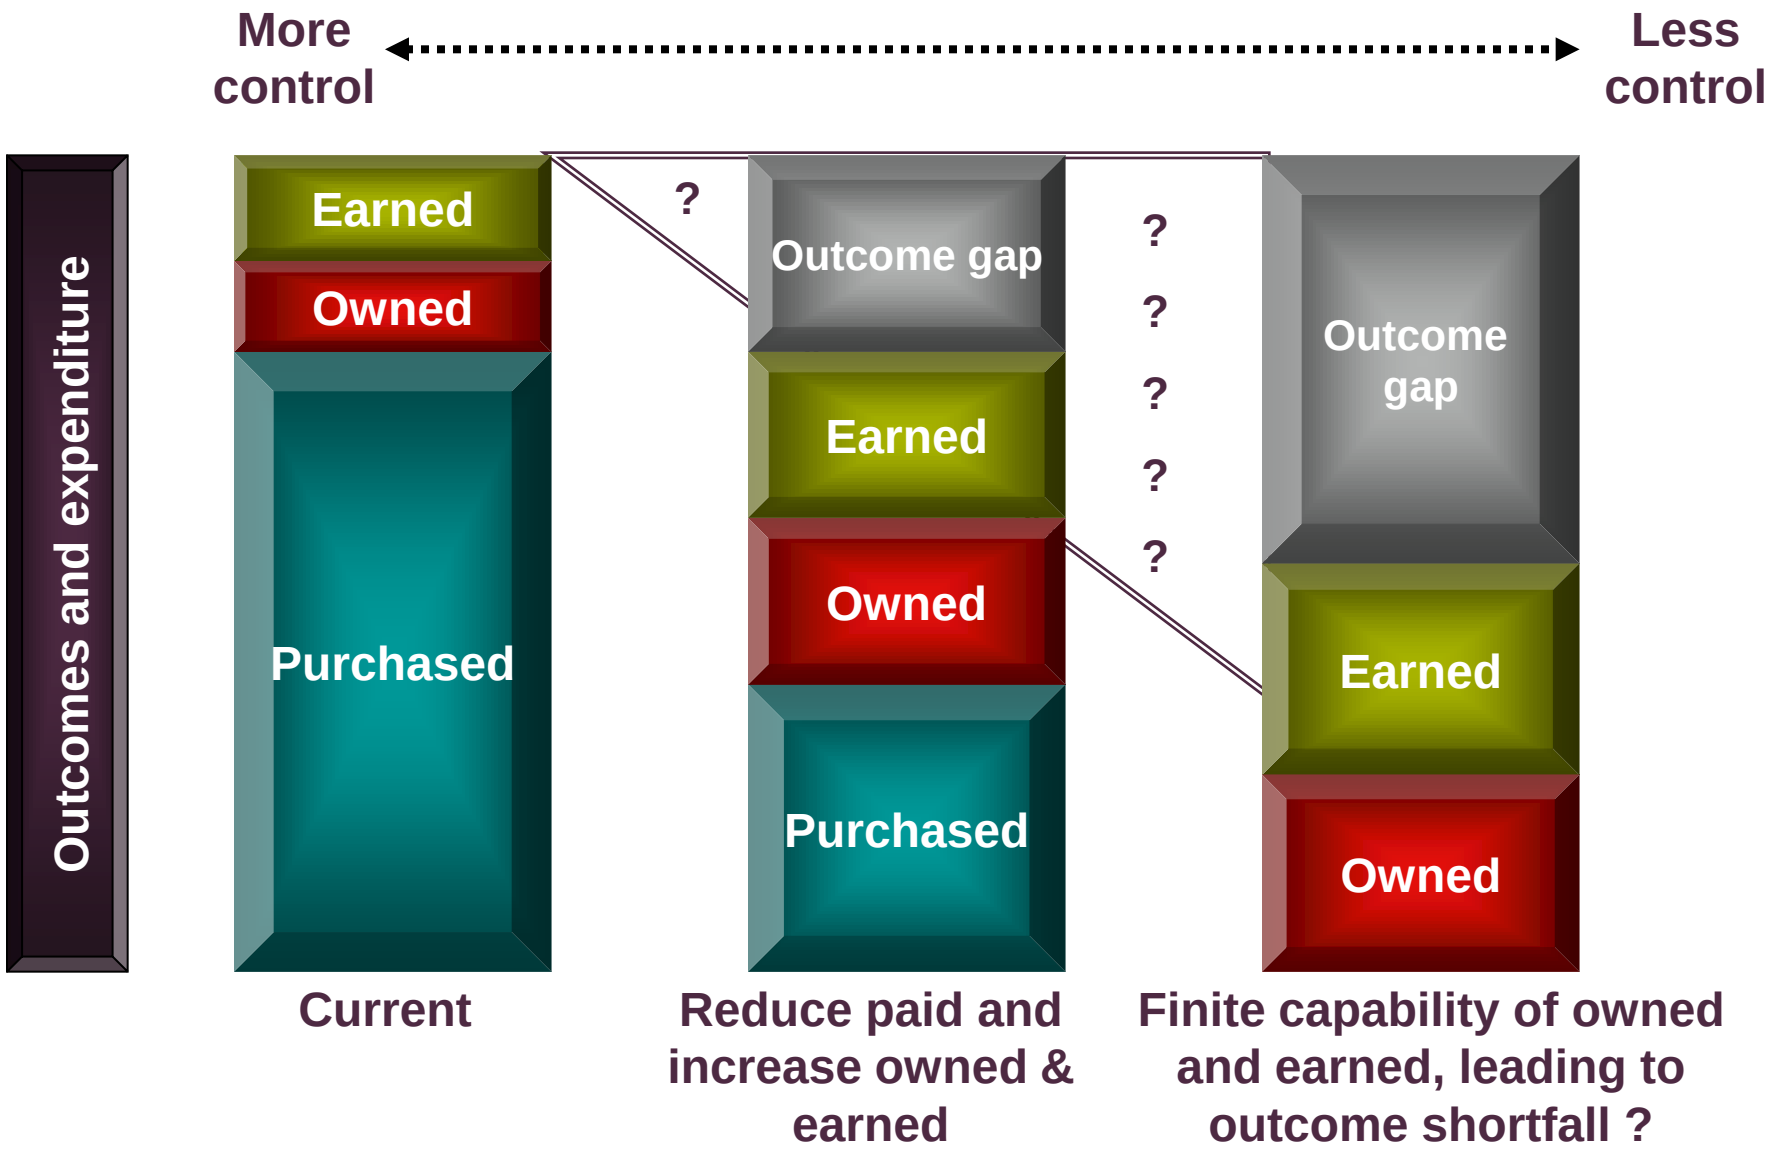
A new opportunity for Government Marketing

COI

"The last government thought the answer to everything was to launch an advertising campaign…we will look at new, more efficient ways of delivering government communications" (Francis Maude, July 27th 2010)

- Much less spend
- Broadcast to narrowcast
- Supporting and enabling
- More focussed, cogent and sparing

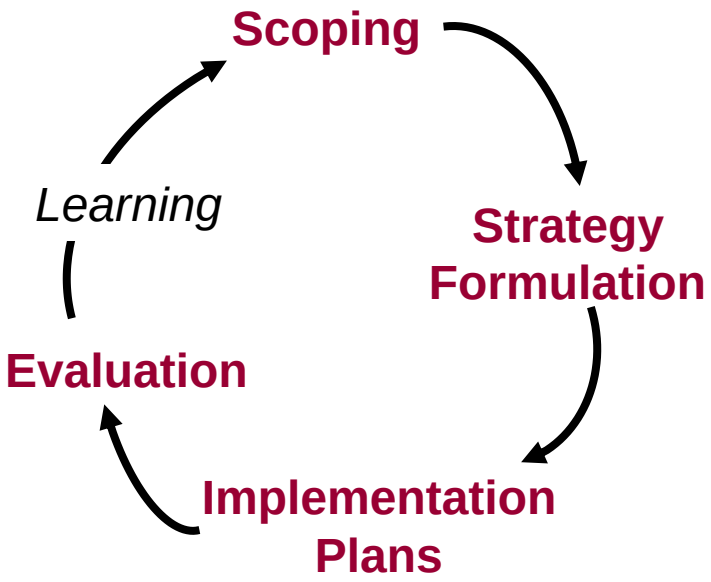
- More disciplined planning
- More targeted objectives
- New model assumptions
- VFM driven



LESS MARKETING £
BUT
MORE MARKETING SKILLS

Four pillars for new outcomes from Government marketing

- **Behavioural insights**
- **Partnerships**
- **Channel balance**
- **Value and evaluation**



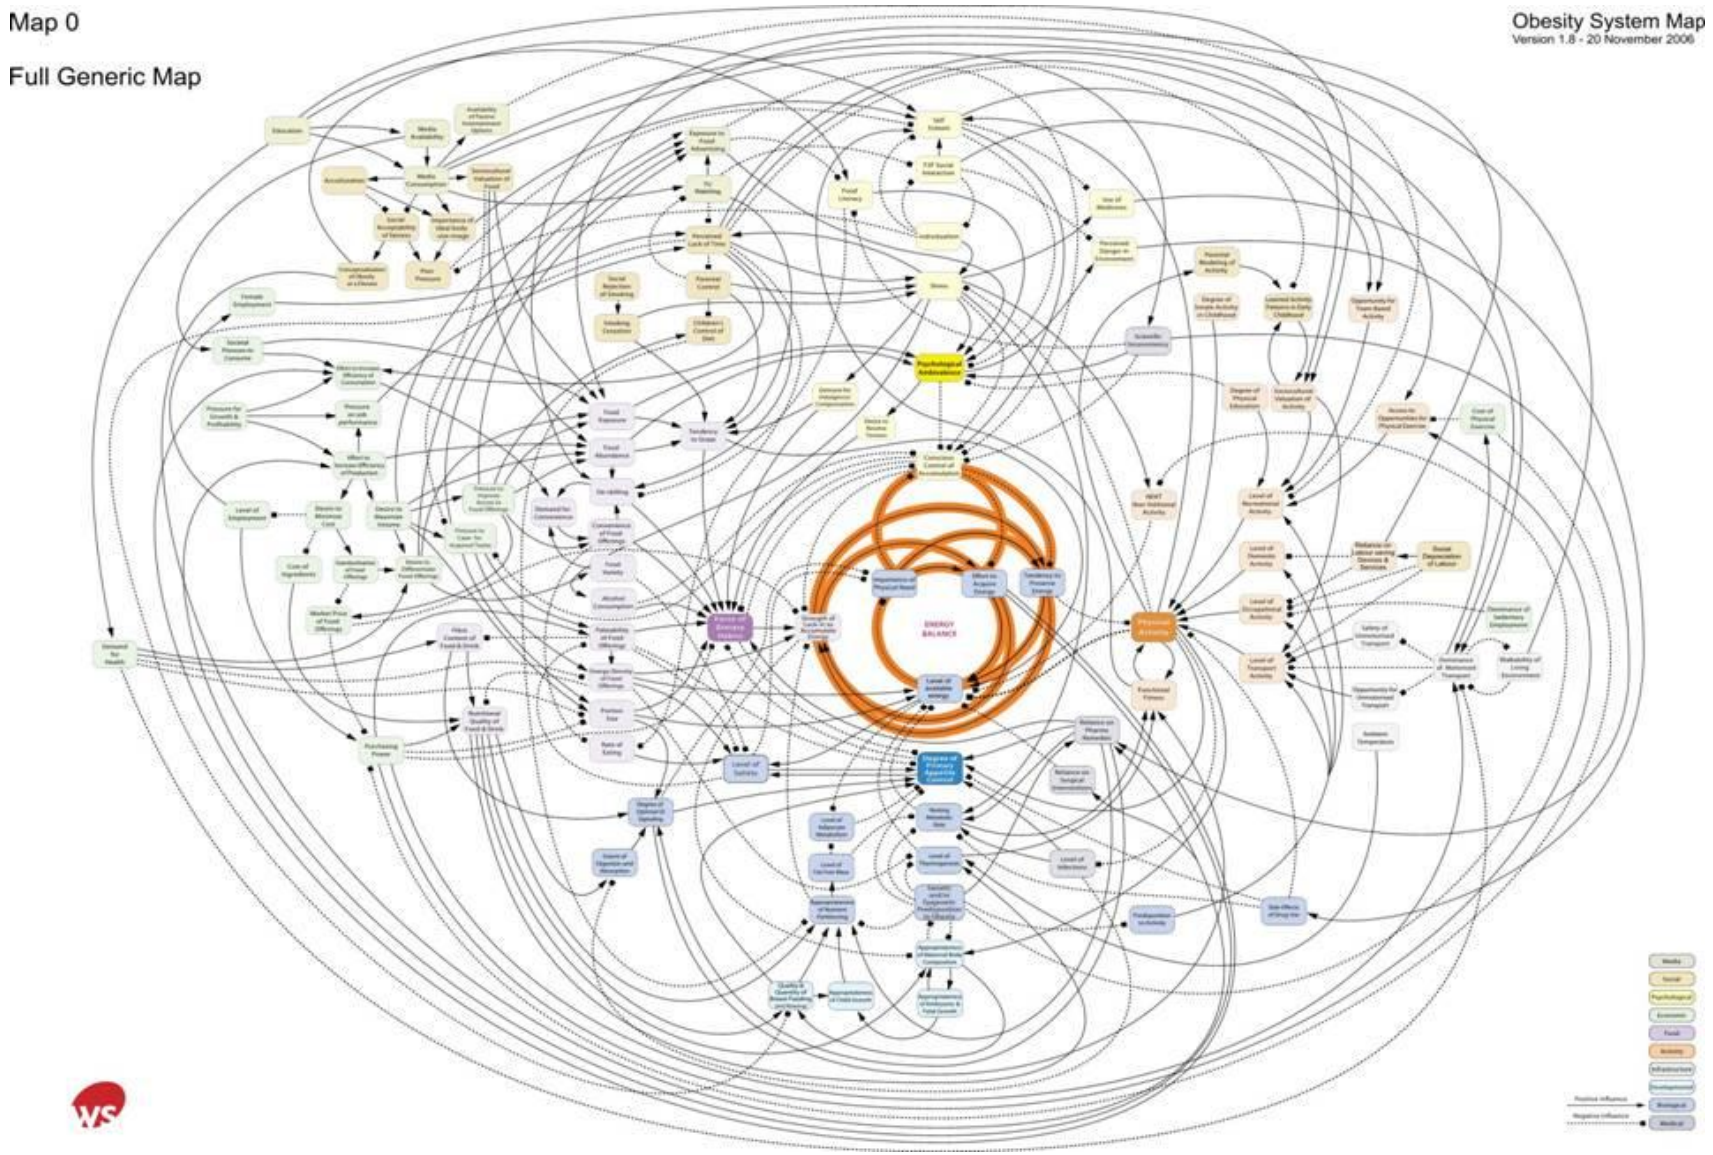
Changing channel balance……

Some implications for health marketers……

1. A co-ordinated approach to marketing planning

- An annual cycle that is co-created between central and local teams, with robust, transparent planning, and is co-ordinated and cascaded out effectively
- All activities to be based on established segmentation and insight, and drawing from a wide range of levers to best deliver behaviour change

'Blueprinting' - horizontal as well as vertical models



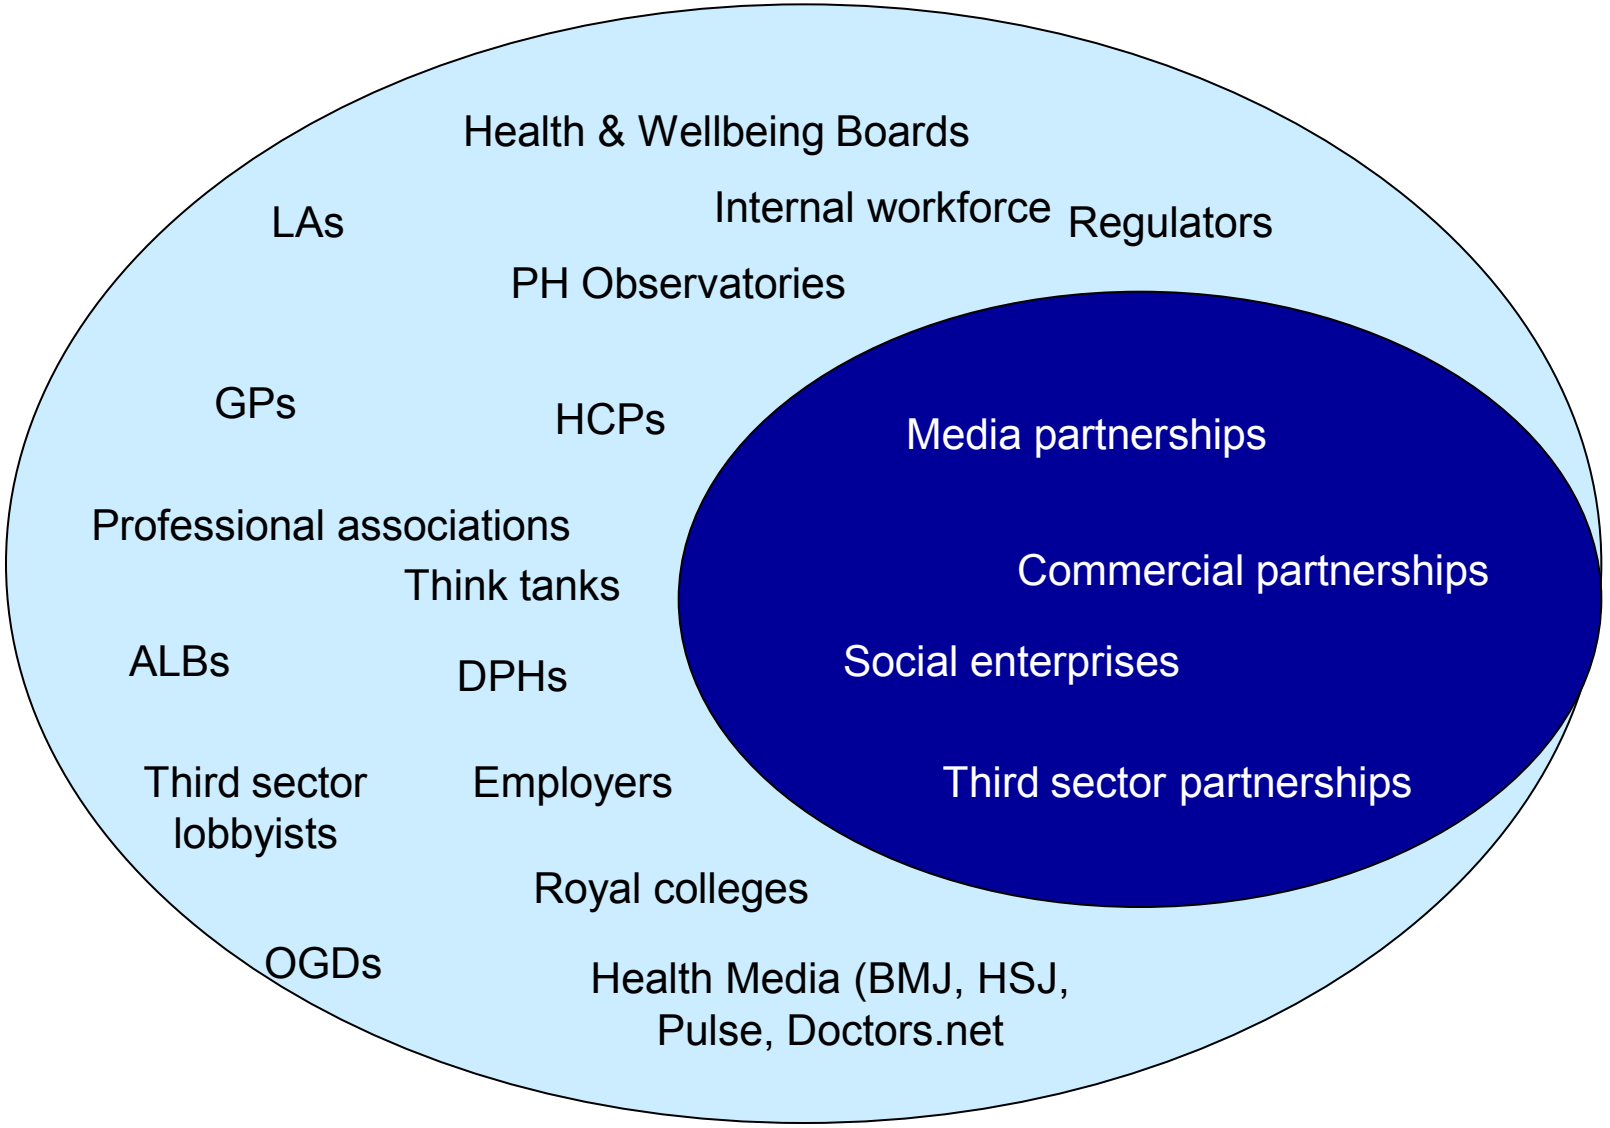
'Do it once' - making it quicker and easier to adopt and adapt than re-invent

Activation Roles

- Lead and pioneer
- or Steal with pride
- or borrow and adapt to suit local needs

Source: Based on OSM DH/NHS Social Marketing Review 2010

2. Ensure hypothetical behaviour change models drive the planning and evaluation process



3. Connect theory to reality in behaviour change

In OSM's analysis, the most successful interventions clearly operated at least 5-6 of these principles

	OSM behaviour change principles
1	Make it as **easy and pleasant** for people to act
2	Create/restate the **social norm** so people 'follow the herd'
3	Create fast **benefits** & reward 'good' behaviour instantly
4	Make it **interesting** to gain momentum and 'viral spread'
5	**Avoid fear** /recrimination unless people resist the positive
6	Get tangible **commitment** – don't let people delay acting
7	Chunk up action in easy steps -make success **achievable**
8	Give **alternatives** not big sacrifices – swaps not costs
9	Use **insight** into how people think to engage emotionally
10	Remove excuses – erect **barriers** to back-sliding
11	Build **coalitions** for impact and credibility

Source: Oxford Strategic Marketing DH/NHS Social Marketing Review 2010

4. Step-change in intermediary marketing, emphasising partnerships with co-authored delivery

4. Step-change in intermediary marketing, emphasising partnerships with co-authored delivery

COI

KEY TASKS

- Strategy formulation including objectives
- Identification of appropriate partners at both a national and local level
- Negotiation with partners
- Co-creation
- Plan development and monitoring
- Oversight of effective delivery of partnership to achieve objectives
- Evaluation of partnership effectiveness
- Ensure partnership synergies across the health sector, avoiding unhelpful duplication

"Wherever possible, we want people to call the shots over the decisions that affect their lives". Coalition Document

KEY CHALLENGES

- Joining up national/regional/local
- Robust evaluation
- Trade off between control and energy
- Co-ordination

CSFs

- Supreme account management, brokering and negotiation skills
- Planned, co-ordinated approach
- Reaching agreement on price and other terms of the offer

5. Catalysing and facilitating the Big Society

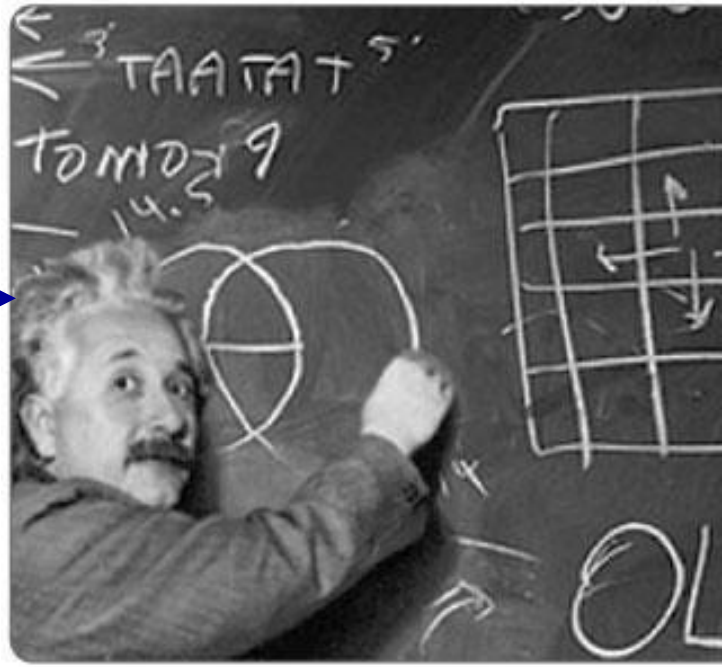
COI

Give communities more powers

Encourage people to take an active role in their communities

Transfer power from central to local government

Support co-ops, mutuals, charities and social enterprises



Publish government data

- **Nurturing the early shoots of emerging big society - groups or interested individuals**
- **Identify topics of mutual interest, make contacts, share ideas and provide support**
- **Supporting volunteers and activists attempting to run new projects**
- **Bringing alive user-generated content**

6. Capturing and sharing knowledge, then reapplying it effectively

- Incentivise the knowledge culture
- Reduce duplication
- Identify and link ‘statistical neighbours’
- Flexible, searchable interactive
- Encouraging ‘horizontal’ models

Many uncertainties……..

- Inherent tension between the thirst for efficiency (eg avoiding duplication) and the devolved model
- Will the serious appetite for innovation become a reality in tough times?
- Will providing information be enough?
- Which metrics need to be developed for the new world marketing?
- Is the Big Society a social movement or a collection of social movements?

Foreword

Influencing people's behaviour is nothing new to Government, which has often used tools such as legislation, regulation or taxation to achieve desired policy outcomes. But many of the biggest policy challenges we are now facing – such as the increase in people with chronic health conditions – will only be resolved if we are successful in persuading people to change their behaviour, their lifestyles or their existing habits. Fortunately, over the last decade, our understanding of influences on behaviour has increased significantly and this points the way to new approaches and new solutions.

So whilst behavioural theory has already been deployed to good effect in some areas, it has much greater potential to help us. To realise that potential, we have to build our capacity and ensure that we have a sophisticated understanding of what does influence behaviour. This report is an important step in that direction because it shows how behavioural theory could help achieve better outcomes for citizens, either by complementing more established policy tools, or by suggesting more innovative interventions. In doing so, it draws on the most recent academic evidence, as well as exploring the wide range of existing good work in applying behavioural theory across the public sector. Finally, it shows how these insights could be put to practical use.

This report tackles complex issues on which there are wide-ranging public views. We hope it will help stimulate debate amongst policy-makers and stakeholders and help us build our capability to use behaviour theory in an appropriate and effective way.

Sir Gus O'Donnell

Cabinet Secretary and
Head of the Home Civil Service

Sir Michael Bichard

Executive Director,
Institute for Government

About the authors

Paul Dolan is a Professor of Economics in the Department of Social Policy at the LSE. His research focuses on developing measures of subjective well-being for use by policy-makers and applying lessons from behavioural economics to understand and change individual behaviour. Paul has advised various UK government departments and he is currently chief academic adviser on economic appraisal for the Government Economic Service.

Michael Hallsworth is a Senior Researcher at the Institute for Government. He has conducted cross-government research into organisational behaviour, machinery of government changes, and information technology. His current research focuses on behaviour change and public policy-making. Previously, he was at RAND Europe (a not-for-profit public policy research institute), specialising in futures thinking and performance management.

David Halpern is Director of Research at the Institute for Government. He was Chief Strategist at the Prime Minister's Strategy Unit between 2001 and 2007. He is the author of Social Capital and The Hidden Wealth of Nations (both Polity Press), and a co-author of the report *Changing Behaviour and Personal Responsibility*. Prior to this, he was a University Lecturer in the Faculty of Social and Political Sciences at Cambridge University.

Dominic King is a Specialty Registrar in General Surgery and a Clinical Research Fellow in the Department of Surgery and Cancer at Imperial College London. He is currently researching the role of behavioural economics in developing effective health policy, including the impact of personalised health budgets, the role of incentives in changing health behaviours and the design of robust research protocols in behaviour change research.

Ivo Vlaev is a Senior Lecturer in Psychology in the Faculty of Medicine at Imperial College London. His research focuses on studying human judgment and decision-making by exploring models and methods from experimental psychology, behavioural economics, and neuroscience. His specific research topics are behaviour change, risk attitudes, consumer behaviour, cooperation, and well-being.

This report represents a truly collaborative effort between the five of us and, in the economists' tradition, we are listed alphabetically.

About this report

In 2009, Sir Gus O'Donnell, Cabinet Secretary and Head of the Home Civil Service, asked Matt Tee, Permanent Secretary for Government Communication, to review the implications of behavioural theory for policy-making. The Cabinet Office commissioned the Institute for Government to produce this report, exploring the application of behavioural theory to public policy for senior public sector leaders and policy-makers. It is a key part of a programme of work designed to build capacity and capability in this area across the Civil Service.

We have approached the topic collaboratively. The programme began with a behaviour change summit in May 2009, which brought together senior policy, strategy and insight officials from across government, alongside a number of external experts.

We approached the report by first developing an understanding of how and where behavioural theory is currently being used in public services, and the challenges it presents. The report is grounded in a series of interviews with senior civil servants, academics and behaviour change experts but the views expressed in the report are those of the authors and Institute for Government. Our thanks go to the many people we interviewed as part of our research. We would also like to thank Dr Robert Metcalfe for his work analysing the effects that underpin MINDSPACE.

This is the full version of the report. Those looking for a summary of the main practical applications may wish to consult the Short Version, also available at www.instituteforgovernment.org.uk.

Executive summary

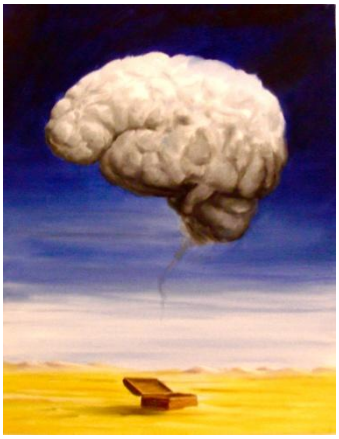
Influencing behaviour is central to public policy, and government can draw on a potentially powerful new set of tools

Influencing behaviour is central to public policy. Recently, there have been major advances in understanding the influences on our behaviours, and government needs to take notice of them. This report aims to make that happen.

For policy-makers facing policy challenges such as crime, obesity, or environmental sustainability, behavioural approaches offer a potentially powerful new set of tools. Applying these tools can lead to low cost, low pain ways of "nudging" citizens - or ourselves - into new ways of acting by going with the grain of how we think and act. This is an important idea at any time, but is especially relevant in a period of fiscal constraint.

Recently, many books and reports have highlighted the potential benefits that behavioural approaches can bring to public policy. This report is not just an overview of theory; it addresses the needs of policy-makers by:

- Condensing the relevant evidence into a manageable "checklist", to ensure policy-makers take account of the most robust effects on our behaviour
- Demonstrating how behavioural theory can help meet current policy challenges, including full case studies of its application in the UK
- Showing how government can build behavioural theory into its current policy-making practices
- Exploring important issues around the need for public permission and the role of personal responsibility



Policy-makers are interested, but need help in applying insights in practice

This report has emerged from many discussions with senior civil servants and ministers. All indicated that there was a real appetite to absorb and apply the latest thinking, in order to equip the civil service to meet the pressing challenges ahead. But they also felt that more help was needed to translate this appetite into action. In practice, how can these ideas actually help government make policy better? They are interesting effects but, fundamentally, "So what?"

This report tries to answer the "so what?" question for policy-makers.

MINDSPACE: a checklist for policy-makers

The vast majority of public policy aims to change or shape our behaviour. And policy-makers have many ways of doing so. Most obviously, they can use "hard" instruments such as legislation and regulation to compel us to act in certain ways. These approaches are often very effective, but are costly and inappropriate in many instances. So government often turns to less coercive, and sometimes very effective, measures, such as incentives (e.g. excise duty) and information provision (e.g. public health guidance) – as well as sophisticated communications techniques.

Why, then, is there a need to change anything? Behavioural theory suggests two reasons. First, the impact of existing tools such as incentives and information can be greatly enhanced by new evidence about how our behaviour is influenced (some of which has already been incorporated into government communications). Second, there are new, and potentially more effective, ways government could shape behaviour.

Tools such as incentives and information are intended to change behaviour by "changing minds". If we provide the carrots and sticks, alongside accurate information, people will weigh up the revised costs and benefits of their actions and respond accordingly. Unfortunately, evidence suggests that people do not always respond in this 'perfectly rational' way.

In contrast, approaches based on "changing contexts" - the environment within which we make decisions and respond to cues - have the potential to bring about significant changes in behaviour at relatively low cost. Shaping policy more closely around our inbuilt responses to the world offers a potentially powerful way to improve individual wellbeing and social welfare.

MINDSPACE is a checklist of influences on our behaviour for use when making policy

With this in mind, we set out nine of the most robust (non-coercive) influences on our behaviour, captured in a simple mnemonic – MINDSPACE – which can be used as a quick checklist when making policy.

Messenger	we are heavily influenced by who communicates information
Incentives	our responses to incentives are shaped by predictable mental shortcuts such as strongly avoiding losses
Norms	we are strongly influenced by what others do
Defaults	we 'go with the flow' of pre-set options
Salience	our attention is drawn to what is novel and seems relevant to us
Priming	our acts are often influenced by sub-conscious cues
Affect	our emotional associations can powerfully shape our actions
Commitments	we seek to be consistent with our public promises, and reciprocate acts
Ego	we act in ways that make us feel better about ourselves

Meeting policy challenges

We show how this framework can help tackle challenges in three major areas of policy: crime and anti-social behaviour; pro-social behaviour, such as voting and volunteering; and healthy and prosperous lifestyles. For each policy area we give case studies of innovative evidence-based interventions, including:

- How the logic of gang membership was used to combat gang violence (Norms)
- How inertia helped us save more for retirement (Defaults)
- How giant bananas reduced littering (Salience)

We also show how MINDSPACE can generate new approaches to specific policy problems.

Building MINDSPACE into policy-making

MINDSPACE builds on existing methods of policy-making

Applying MINDSPACE in practice builds on existing methods of policy-making. To illustrate this, we have drawn on the "4Es" policy framework, originally developed by DEFRA. The 4Es are four actions that should underpin government's attempts to change behaviour: Enable, Encourage, Engage and Exemplify. MINDSPACE requires two supporting actions: Explore, which takes place before policies are implemented, and Evaluate, which judges the success of the policy.

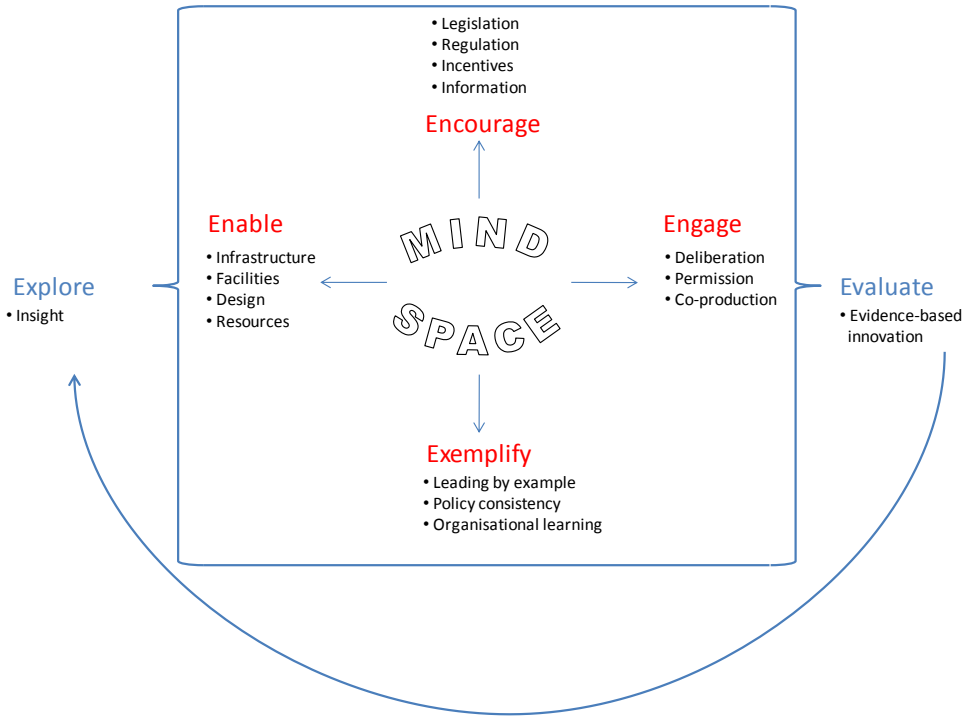


Figure 1: The 6 Es framework for applying MINDSPACE

In basic terms, MINDSPACE represents the tools for changing behaviour, and the 6 Es constitute the framework within which they can be applied. Bringing them together allows policy-makers to address the over-arching "so what?" question in practical ways.

Civil servants need to better understand the behavioural dimension of their actions

But when applying MINDSPACE in practice, it should not simply be seen as an alternative to existing methods. "Behaviour Change" is *part of* policy-making, rather than a novel alternative that can be bolted onto policies. Therefore, civil servants need to better understand the *behavioural dimension* of their policies and actions. MINDSPACE can help them do so in three different ways:

- **Enhance.** MINDSPACE can help policy-makers understand how current attempts to change behaviour could be improved, for example through a better understanding of how people respond to incentives and which types of information are salient. The logic here is that if government is already attempting to shape behaviour, it should do so as effectively as possible.
- **Introduce.** Some of the elements in MINDSPACE are not used extensively by policy-makers, yet may have a considerable impact. For example, there is room for more innovative use of social norms and commitment devices in policies. Of course, introducing new measures in this way may require significant efforts to ensure there is public permission for the approach.
- **Reassess.** Government needs to understand the ways it may be changing the behaviour of citizens unintentionally. It is quite possible that

government produces unintended – and possibly unwanted – changes in behaviour. The insights from MINDSPACE offer a rigorous way of analysing whether and how government is shaping the behaviour of its citizens.

Public permission and personal responsibility

The public need to give permission and shape how these tools are used

The use of MINDSPACE (or other 'nudge' type policy tools) may require careful handling – in essence, the public need to give permission and help shape how such tools are used. With this in mind, we consider issues around gaining democratic permission for behaviour change policies. We explain how three factors are particularly useful for understanding controversy around behaviour change: **who** the policy affects; **what** type of behaviour is intended; **how** the change will be accomplished.

Behaviour change is often seen as government intruding into issues that should be the domain of personal responsibility. However, it is possible for government just to supply the trigger or support for individuals to take greater personal responsibility. And we suggest that evidence from behavioural theory may, in some areas, challenge accepted notions of personal responsibility.

Conclusion

MINDSPACE complements and improves conventional policy tools, rather than replacing them entirely

New insights from the science of behaviour change could lead to significantly improved policy outcomes, and at lower cost, than the way many conventional policy tools are currently used. For the most part, however, MINDSPACE powerfully complements and improves conventional policy tools, rather than acting as a replacement for them. MINDSPACE may also help identify any barriers that are currently preventing changes in behaviour.

But there is still much that we do not know. There remains uncertainty over how lasting many of the effects are; how effects that work in one set of circumstances will work in another; and whether effects that work well with one segment of the population will work with another, including their potential impact on inequalities – though there are grounds to think that going with the grain will help to reduce them.

There are also questions about how far such techniques should be employed by central government or left to local policymakers, professionals and communities. One of the most important roles for central government in the coming years will be to ensure that local and professional applications of behavioural approaches are rigorously evaluated, and the results made available for communities to debate and adopt as they see fit. When the cost-effectiveness for an application is clearly shown, and the public acceptability has been established, central government might them move to national implementation – be this to reduce crime, strengthen communities, or support healthy and prosperous lives.

Whether reluctantly or enthusiastically, today's policymakers are in the business of influencing behaviour, and therefore need to understand the various effects on behaviour their policies may be having. MINDSPACE helps them do so, and therefore has the potential to achieve better outcomes for individuals and society.

Introduction: Understanding why we act as we do

There's no such thing as a free lunch

"Want to grab some lunch?" ask a couple of colleagues as they walk past your desk.

"Sure," you say, as you save the Healthy and Green document you're working on and join them as they head to the lifts. The lifts are busy, and you think about walking over to the stairs - but you're already standing there, so you just wait.

Down in the canteen you pick up your tray and join the line. It smells good. You smile to the man behind the counter and he puts the beef stew on a hot plate and hands it to you. You move along past the vegetarian option, and add a heap of potatoes and carrots to your plate. Putting your plate back on the tray, you pause briefly at the salad bar before adding a bowl of pudding to your tray. As you head to the till, you glance at the bit of space left on your tray and add a can of drink.

"Here you go," your colleague says, as he puts some cutlery and a glass on your tray and you join the queue together. "Damn, I left my card upstairs."

"Here, use mine," you say.

Finally, you make your way towards an empty table. You spot the Perm Sec. It would be great to ask her about that new job. She's at a table for four with just one other person, but somehow you just walk on by and join your colleagues. "I'll catch her another day," you mumble to yourself.

Whether we like it or not, we are continually buffeted by a myriad of influences that shape our behaviour. Some of them are obvious, but many go largely unnoticed. There were many gentle effects on behaviour at your lunch in the canteen. Here are just a few:

- **Social influence and norms.** You joined your friends, of course. You also stood with them by the lifts and waited – but if they headed for the stairs you'd probably have followed (or they would have followed you, if you led).
- **Salience and priming.** The food you chose and how much you took was substantially shaped by what happened in the canteen. The smell primed your hunger, but so too did the size of your plate and the fact that you had a tray. Larger plates can make us take larger portions, and trays substantially increase the total of volume of food we take. And perhaps there is slightly more chance that you would have chosen the vegetarian option if it had come first.
- **Commitment and reciprocity.** One of the factors that kept you and your colleagues at the lift was that you had already psychologically committed to

the idea. A related effect is how readily you paid for your colleague once he had shown you the kindness of getting your cutlery.

- **Incentives and choice environment.** The psychological barrier of joining the four-person table with your boss was too great – despite the potential gains, you were worried about making a fool of yourself. In other words, you were loss-averse, and stuck with the familiar company of your friends. But if the table had eight places or more, with just the two occupied, you might have joined her. The physical environment often subtly shapes our behaviour and the ways in we interact with others.

Many of these influences are now well understood. Others have been demonstrated in experiments, but their impact in everyday contexts is still unclear. For example, we tend to like people more if they give us a hot drink rather than a cold drink – did the warm plate make us feel more positively about the person who gave us our lunch?

There is much more that we need to find out, but we do know enough to set out the main effects on behaviour and to show how they can help policymakers in practice. This report does not just explain theory; it offers tools for government.

Behaviour change and policy

Influencing behaviour is central to public policy

In fact, influencing behaviour is central to public policy. As citizens, communities and policymakers, we want to stop 'bad behaviours': people vandalising our cars, stealing our possessions, or threatening our children. We want to encourage 'good behaviours': volunteering, voting, and recycling. We even sometimes want a little help ourselves to 'do the right thing': to save a little more, eat a little less, and exercise a little more – though we may be ambivalent about how aggressively we want the state intervene in these behaviours.

Sometimes we can agree on how we would like policymakers to change our behaviour – and sometimes they 'nudge' in those directions. But other times those nudges have unintended consequences. Information about how many people are obese may actually encourage more people to join a "club" of which there are many members, while introducing financial incentives to behave a certain way could actually make people less likely to behave that way for free.

There is increasing understanding about the factors that shape our behaviour

Over the last decade, behavioural economics, which seeks to combine the lessons from psychology with the laws of economics, has moved from a fringe activity to one that is increasingly familiar and accepted.[1] More generally, there is increasing understanding across the behavioural sciences about the factors that shape and affect our behaviour.

Drawing on the most recent evidence, this report sets out the most robust effects that influence individual behaviour; demonstrates how these have been applied to major policy issues – and what more can be done; and considers the practical implications and political concerns about applying these methods. By applying these advances to the real challenges that government faces today, it tries to answer the 'so what?' question for policy-makers.

This report complements the Government Social Research guide to Behaviour Change (which outlines various models for understanding and applying different models of behaviour), the Central Office of Information's Communications and Behaviour Change (which focuses specifically on the implications for Communications), and the Cabinet Office's Guide to Segmentation.[2]

One obvious answer to the 'So what?' question concerns value for money. Fiscal challenges may sharpen interest in behaviour change further, as policymakers and public service professionals wrestle with the challenge of how to achieve 'more

with less' – though it could also lead to some services and local areas abandoning more innovative approaches to behaviour change altogether.[3]

"Doing nothing" is never a neutral option

Whether we like it or not, the actions of policymakers, public service professionals, markets and our fellow citizens around us have big, and often unintended, impacts on our behaviour. 'Doing nothing' is never a neutral option: we are always busy shaping each other's behaviour. For example, if governments keep a distance, markets may emerge to satisfy our preferences. While this often does not cause major problems, it can do – markets rarely account properly for the good and bad spill over effects of our own behaviour on others.[4]

This picture shows the need to recognise that government is just one influence on our behaviour amongst many others. And, indeed, commentators have been sceptical about government's abilities in this area: most famously, David Hume argued that 'all plans of government which suppose great reformation in the manners of mankind are plainly imaginary'.[5]

Such sweeping scepticism is unfounded, since there have been many policy successes in changing behaviour: for example, reducing drink driving, preventing AIDS transmission and increasing seatbelt usage. Nevertheless, some behaviours – such as antisocial behaviour and lack of exercise - have remained resistant to policy interventions. We need to think in more integrated and innovative ways about how policymakers can intervene in ways that help people help themselves – and that also help society reduce inequalities in health and wellbeing that are avoidable and considered unfair.

The most effective and sustainable changes in behaviour will come from the successful integration of cultural, regulatory and individual change

We recognise that the most effective and sustainable changes in behaviour will come from the successful integration of cultural, regulatory and individual change – drink driving demonstrates how stiff penalties, good advertising and shifting social norms all combined to change behaviour quite significantly over a couple of decades.[6] Here we focus on the role that behavioural economics can play in shaping individual behaviour, rather than on the ways in which the legal and regulatory systems can be used to compel us to behave in particular ways. We are interested in the soft touch of policy rather than its heavy hand: going with the grain of human nature, rather than rubbing us up the wrong way.

The basic insight from behavioural economics

Drawing on psychology and the behavioural sciences, the basic insight of behavioural economics is that our behaviour is guided not by the perfect logic of a super-computer that can analyse the cost-benefits of every action. Instead, it is led by our very human, sociable, emotional and sometimes fallible brain. Psychologists have been studying these characteristics for more than a century, and writers and thinkers for much longer.[7]

Skimming the titles of recent best-sellers on the topic gives a rapid sense of what this century of research, and particularly that of the last 30 years, has concluded. The Noble Prize winner Daniel Kahneman's ideas around *Heuristics and Biases – the psychology of intuitive judgement* – has been especially influential, though few policymakers have read his work in the original. We are *Predictably Irrational* – prone to reliable misjudgements.[8]

Often the decisions we make in make in the *Blink* of an eye serve us well in everyday life.[9] But for some of the more complex decisions we face in the modern world, our unseen patterns of thought leave us puzzling and frustrated over our own decisions - *Stumbling on happiness* rather than confidently making choices that get us there.[10] These insights can be used by marketers and others to *Influence*[11] or *Nudge*[12] what we do and what we choose.

In a nutshell, the sophisticated mental shortcuts that serve us so well in much of life can also get us into trouble, both as individuals and as societies as a whole.

Changing behaviour

Broadly speaking, we can focus on 'changing minds' or 'changing the context'

In broad terms, there are two ways of thinking about changing behaviour. The first is based on influencing what people consciously think about. We might call this the 'rational' or 'cognitive' model. Most traditional interventions in public policy take this route, and it is the standard model in economics. The presumption is that citizens and consumers will analyse the various pieces of information from politicians, governments and markets, the numerous incentives offered to us and act in ways that reflect their best interests (however they define their best interests, or - more paternalistically - however policymakers define them).

The contrasting model of behaviour change focuses on the more automatic processes of judgment and influence – what Robert Cialdini calls 'click, whirr' processes of mind. This shifts the focus of attention away from facts and information, and towards altering the context within which people act. We might call this the 'context' model of behaviour change. The context model recognises that that people are sometimes seemingly irrational and inconsistent in their choices, often because they are influenced by surrounding factors. Therefore, it focuses more on 'changing behaviour without changing minds'. This route has received rather less attention from researchers and policymakers.

These two approaches are founded on two different ways of thinking. Psychologists have recently converged on the understanding that there are two distinct 'systems' operating in the brain:[13]

System	**Reflective**	**Automatic**
Characteristics	Controlled	Uncontrolled
	Effortful	Effortless
	Deductive	Emotional
	Slow	Fast
	Self-aware	Unconscious
Examples of use	*Learning a foreign language* *Planning an unfamiliar journey* *Counting calories*	*Speaking in your mother tongue* *Taking the daily commute* *Desiring cake*

The two systems have different capabilities: the reflective mind has limited capacity, but offers more systematic and 'deeper' analysis. The automatic mind processes many things separately, simultaneously, and often unconsciously, but is more 'superficial': it takes short-cuts and has ingrained biases. As one academic source explains, 'once triggered by environmental features, [these] preconscious automatic processes run to completion without any conscious monitoring'.[14]

In practice, this distinction is not so clear-cut: a mix of both reflective and automatic processes govern behaviour. When reading a book, for example, we can concentrate and ignore our surrounding environment – but if someone calls our name, we break off and look at them. Our *reflective* system is ignoring everything but the book, but our *automatic* system is not.[15] Policy-makers attempting to change behaviour need to understand how people use these different systems and how they affect their actions.

This report focuses on the more automatic or context-based drivers of behaviour

This report focuses on the more automatic or context-based drivers of behaviour, including the surrounding 'choice environment'. There are three main reasons for doing so. First, these automatic processes have been relatively neglected in policy discussions, perhaps because 'environmental effects on behaviour are a lot stronger than most people expect'.[16] Second, because of questions about the effectiveness and cost-effectiveness of interventions designed to change behaviour by changing minds. Third, because of the possible value for money that this type of behaviour change may offer. The following two sections address the latter two points.

The limits to information

Not all government communications focus on simple information provision; often they draw on more sophisticated techniques of persuasion. Nevertheless, giving out information has become a prominent part of the policymaker's tool kit, and its importance is set to increase further.[17] Across the world, policymakers are giving citizens more and more information about the performance of schools, hospitals and other public services, to be mashed and re-circulated in a myriad of innovative and personalised ways.

The increased availability of information has significant effects, most of them positive. For example, despite initial controversies, the wider availability of information on surgical survival rates has been shown to drive up outcomes.[18] The release of public data could lead to a significant increase in economic growth.[19] And information is obviously important in its own right, as it leads to more fully informed consumers and citizens - even if the information has no direct effect on behaviour.

Simply providing information often has modest and sometimes even unintended impacts

But we also know that providing information *per se* often has surprisingly modest and sometimes even unintended impacts when it attempts to change individuals' behaviour – at least when viewed through the conventional rational model of behaviour, and perhaps also when viewed by a policy-maker charged with getting value for money and in reducing inequalities.

After public warnings of an 'obesity epidemic', New York State passed legislation that made restaurants post the calorific content of all regular menu items. Initial studies found no detectable change in calories purchased after the introduction of labelling.[20] The reason for this may be that to most New Yorkers this information does not mean anything much, or – according to one early analysis - they are not aware of what levels of calories are good or bad. New York City has subsequently initiated an educational campaign that informs residents that '2,000 calories a day is all most adults should eat'.

More generally, it has been found that existing 'changing minds' theories and methods leave a substantial proportion of the variance in behaviour to be explained.[21] For example, one meta-analysis of pro-environmental behaviours reported that at least 80% of the factors influencing behaviour did not result from knowledge or awareness.[22] And insofar as the better educated, higher income, more advantaged minds are the first and easiest minds to change, inequalities in health and wellbeing may be widened by information campaigns. We therefore need to see if accounting for and influencing the context – the 'Automatic System' – can help use resources more efficiently and fairly.

Value for money

"Behaviour Change" is often seen as attractive because it appears to offer similar or better outcomes at less cost. The obvious rationale for this is that, since government spends a considerable amount of money on influencing behaviour, its success in doing so will be maximised if it draws on robust evidence of how people

The money government spends trying to change behaviour will be maximised if it draws on evidence of how people actually behave

actually behave. Indeed, there is also some evidence to back up the view that changing the context, rather than people's minds, may be more cost-effective. For example, one study evaluating the cost effectiveness of physical activity programmes found that context-altering interventions had the potential to be more cost-effective than more information-based ones (such as phone or paper materials, consultations with an exercise development officer, counselling sessions).[23] Indeed, the most cost-effective intervention was one that introduced bicycle and pedestrian trails to encourage healthy behaviours.[24]

This type of intervention is similar to the 'nudges' outlined by Thaler and Sunstein, which often involve apparently minor alterations to the choices and environment in which people act. For example, one intervention tried to provoke drivers to reducing their driving speed by painting a series of white stripes onto the road that are initially evenly spaced but get closer together as drivers reach a dangerous curve. This environmental design gives the sensation that driving speed is increasing (even when the speed does not really change), which in turn triggers the driver's natural instinct to slow down. The cost of sending such a visual signal is close to zero, but the effectiveness is very significant.[25]

Perhaps the strongest argument for cost-effectiveness is that, quite simply, there is no neutral option for government interventions – government influences behaviour no matter what it does, and therefore it's likely that this ever-present behavioural dimension can be harnessed at little cost. Defaults are the most obvious candidates here: if government has to produce a particular form, it might as well be structured in a way that may benefit both the user and the state.[26] Such thinking has obvious value in a constrained fiscal climate.

The structure of this report

This report outlines some of the most reliable tools that policymakers may wish to use for what we have termed 'soft' behavioural change (as opposed to legislation and regulation). One weakness of the literature around behavioural economics is that there are now literally hundreds of different claimed effects and influences. Some of the claims in the literature are based on just one or two studies or interventions or may not translate well to different target audiences.

Outlining robust effects on behaviour

Chapter 2 highlights a cluster of the most robust effects that have been repeatedly found to have strong impacts on behaviour. We discuss these effects according to the acronym MINDSPACE (**M**essenger, **I**ncentives, **N**orms, **D**efaults, **S**alience, **P**riming, **A**ffect, **C**ommitment and **E**go). We stress that this may not reflect an exhaustive categorisation, but it does reflect where most policy interventions are likely to focus. We give a graphical illustration of the effects underpinning MINDSPACE in Annex 1. There is considerable overlap between the effects and the most effective interventions will certainly combine different elements.

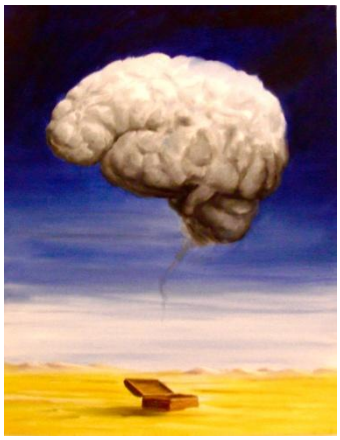
Relevance to policy

Chapter 3 applies the framework set out in Chapter 2 to policy. We focus on three important areas of policy: safer communities, the good society, and healthier and more prosperous lives. There have been many attempts to influence behaviour through cognition (changing minds) in these areas, sometimes with quite limited success. We therefore draw on case studies that are known to have worked, and also point to innovative pilots and more speculative ideas that follow from the elements of MINDSPACE.

Applying the framework in practice

Chapter 4 demonstrates how MINDSPACE could be applied in practice. Building on work by DEFRA, we show that there are six main actions that need to be taken: Explore, Enable, Encourage, Engage, Exemplify and Evaluate. We explain each of these actions and give examples to show how they fit together as a framework.

Public permission and personal responsibility



Chapter 5 considers the wider democratic and political implications of applying behavioural economic principles to policy. It discusses the value judgements of

citizens and policymakers about the extents and limits of personal responsibility and the appropriate role of the state in influencing behaviour. As the profile of behavioural economics has grown in recent years, so too has controversy about its acceptability and application to public policy.

Conclusions and future challenges

Chapter 6 summarises where we have got to and shows what more needs to be done. Perhaps the greatest impact of behavioural economics will be improving the effectiveness and acceptability of many of our existing policy tools. For example, it offers the promise of making information and incentives – communications, social marketing, fines, benefits and so on – more effective and cost-effective. Chapter 6 also provides some clear analysis of future challenges and likely developments.

MINDSPACE: A user's guide to what affects our behaviour

The elements described here are those that we consider to be the most robust effects that operate largely, but not exclusively, on the 'Automatic System'. They illustrate some of main tools at the disposal of individuals and policymakers in influencing behaviour. We do not claim to cover all of the possible effects on behaviour, and we do not deal with more traditional interventions that rely on providing information and education.

We outline nine robust influences on human behaviour and change. These principles are underpinned by considerable research from the fields of social psychology and behavioural economics. They are therefore presented as the most robust effects that policy-makers should understand and, if appropriate, use. The following sections briefly explain these effects, which we have arranged according to the acronym: **MINDSPACE.**

Messenger	we are heavily influenced by who communicates information
Incentives	our responses to incentives are shaped by predictable mental shortcuts such as strongly avoiding losses
Norms	we are strongly influenced by what others do
Defaults	we 'go with the flow' of pre-set options
Salience	our attention is drawn to what is novel and seems relevant to us
Priming	our acts are often influenced by sub-conscious cues
Affect	our emotional associations can powerfully shape our actions
Commitments	we seek to be consistent with our public promises, and reciprocate acts
Ego	we act in ways that make us feel better about ourselves

Some of the elements have been developed to explain largely automatic effects on behaviour (e.g. N, D, S, P, A) while other effects relate to elements that draw more on reflective processing (e.g. M, I, C, E).[27] We recognise there are important lessons for policy-makers coming from more traditional theories of behaviour change that relate to the Reflective System. But we can only understand how incentives work, for example, when we account for the automatic effects of loss aversion alongside the more considered weighing up of costs and benefits.

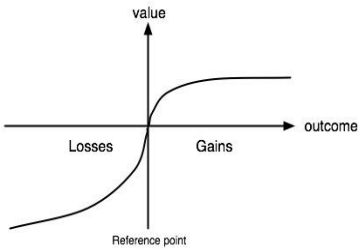
MINDSPACE is our judgment of how best to select and categorise the effects so policy-makers can use them. But it does not offer a clearly logical order, and there is some overlap between the effects. Annex 1 gives a diagram that maps the conceptual space underlying the elements in MINDSPACE and also presents the interrelationships between them.

The follow sections explain each effect in turn.

Messenger

We are heavily influenced by who communicates information

The weight we give to information depends greatly on the reactions we have to the source of that information. We are affected by the perceived authority of the messenger (whether formal or informal). For example, there is evidence that people are more likely to act on information if experts deliver it. One study showed that health interventions delivered by research assistants and health educators were more effective in changing behaviour compared with interventions delivered by either trained facilitators or teachers – and health educators were usually more persuasive than research assistants.[28]



It has also been shown that demographic and behavioural similarities between the expert and the recipient can improve the effectiveness of the intervention. Importantly in relation to addressing inequalities, those from lower socioeconomic groups are more sensitive to the characteristics of the messenger, and this highlights the need to use messengers from diverse demographic and behavioural backgrounds.[29]

Whilst expertise matters, so do peer effects. The 'Health Buddy' scheme involved older students receiving healthy living lessons from their schoolteachers. The older students then acted as peer teachers to deliver that lesson to younger 'buddies'. Compared with control students, both older and younger 'buddies' enrolled in this scheme showed an increase in healthy living knowledge and behaviour and beneficial effects on weight.[30] Another study found a 1,000% increase in smoking amongst teenagers if two of their peers smoke, compared to a 26% increase if a parent does.[31]

We are also affected by the feelings we have for the messenger: for example, we may irrationally discard advice given by someone we dislike.[32] Feelings of this kind may override traditional cues of authority, so that someone who has developed a dislike of government interventions may be less likely to listen to messages that they perceived to come from 'the government'. In such cases, the most effective strategy for changing behaviour may be to use third parties or downplay government involvement in a campaign or intervention.

We also, of course, use more rational and cognitive means to assess how convincing a messenger is. For example, we will consider such issues as whether there is a consensus across society (do lots of different people say the same thing?) and the consistency across occasions (does the communicator say the same thing in different situations?).[33]

As with other effects, combining the lessons from context with those from cognition will lead to the most effective behaviour change interventions. In particular, we should think more carefully about which messengers to mobilise,[34] in which circumstances, and whether they should focus mainly on the Automatic or Reflective ways of thinking.

Incentives

Our responses to incentives are shaped by predictable mental shortcuts such as strongly avoiding losses

Incentives are used across local and central government as a mechanism to motivate behaviour change. The impact of incentives clearly depends on factors such as the type, magnitude and timing of the incentive. Behavioural economics suggests other factors can affect how individuals respond to incentives, which can

allow us to design more effective schemes. We stress that although our examples mainly concern money, incentives often do not involve money but more generally change the costs and benefits of behaving in particular ways.

The five main, related insights from behavioural economics are that:

1. Losses loom larger than gains.

We dislike losses more than we like gains of an equivalent amount. Most current incentive schemes offer rewards to participants, but a recent review of trials of treatments for obesity involving the use of financial incentives found no significant effect on long-term weight loss or maintenance.[35] An alternative may be to frame incentives as a charge that will be imposed if people fail to do something. One recent study on weight loss asked some participants to deposit money into an account, which was returned to them (with a supplement) if they met weight loss targets. After seven months this group showed significant weight loss compared to their entry weight. The weight of participants in a control group was not seen to change.[36] The fear of losing money may have created a strong incentive to lose weight. Therefore, policy-makers could emphasise the money that people will lose by not taking an action, rather than the amount they could save.

2. Reference points matter.

Economic theory assumes that we care only about final outcomes. But, just as objects appear to be larger the closer they are, evidence suggests that the value of something depends on where we see it from – and how big or small the change appears from that reference point. If the utility of money is judged relative to very locally and narrowly determined reference points, a small incentive could have a great effect.[37] As possible evidence of this, incentives were used in Malawi to encourage people to pick up their HIV result (many do not otherwise): take-up was doubled by incentives just worth one-tenth of a day's wage. Although take-up did increase slightly when more money was offered, this was to a much lesser degree (and to a much lesser extent than would be suggested by standard models of diminishing marginal utility of income). This suggests that policy-makers could make effective use of incentives by framing the reference point.

3. We overweight small probabilities.

Economic theory assumes that we treat changes in probability in a linear way – the change from 5% to 10% probability is treated the same as the change from 50% to 55%. But evidence suggests that people place more weight on small probabilities than theory suggests.[38] There are some obvious implications of this for government: lotteries may act as a powerful motivation (since people overweigh the small chance of winning), while people are likely to overemphasise the small chance of, say, being audited, which may lead to greater tax compliance than rational choice models predict.

4. We mentally allocate money to discrete bundles.

We think of money as sitting in different "mental budgets" – salary, savings, expenses, etc. Spending is constrained by the amount sitting in different accounts[39] and we are reluctant to move money between such accounts. Mental accounting means that identical incentives vary in their impact according to the context: people are willing to take a trip to save £5 off a £15 radio, but not to save £5 off a refrigerator costing £210.[40] This means that policies may encourage people to save or spend money by explicitly 'labelling' accounts for them, without removing their control over exactly how the money is used. The impact of particular expenditure could be boosted by linking it to one mental account rather than another.[41]

5. We live for today at the expense of tomorrow.

We usually prefer smaller, more immediate payoffs to larger, more distant ones. £10 today may be preferred to £12 tomorrow. But £12 in eight days may be preferred to £10 in a week's time. This implies that we have a very high discount rate for now compared to later, but a lower discount rate for later compared to later still. This is known as 'hyperbolic discounting' and it leads people to discount the future very heavily when sacrifices are required in the present – for example, to ensure improved environmental outcomes in the future.[42] There is evidence that the immediacy of reward has an impact on the success of schemes to treat substance misuse disorders.[43] Understanding hyperbolic discounting will allow policy-makers designing incentive schemes to calibrate the size and timing of rewards offered more effectively.

Financial incentives and 'crowding out/in'

Behavioural economics can also provide arguments against using financial incentives. It is claimed that monetary compensation can lead to feelings that an activity is worthy in itself ('intrinsic' motivations) being 'crowded out' or partially destroyed. Once an activity is associated with external reward ('extrinsic' motivations), individuals are less inclined to participate with the activity in the future without further incentives.[44] An implication of this may be that if we provide an incentive for people to stop smoking, they may be unlikely to give up other damaging activities (e.g. alcohol misuse) without similar rewards.

Conversely, incentives could 'crowd in' desirable behaviour. The congestion charge, for example, may have acted as a signal not to use cars in the centre of London, and built up a cumulative behavioural response that extended beyond the financial incentive *per se*.[45] We need to develop a better understanding of where incentives have negative and positive spill over effects and design our research and policy efforts accordingly.

Norms

We tend to do what those around us are already doing

Social and cultural norms are the behavioural expectations, or rules, within a society or group. Norms can be explicitly stated ('No Smoking' signs in public places) or implicit in observed behaviour (shaking the hand of someone you meet for the first time). People often take their understanding of social norms from the behaviour of others, which means that they can develop and spread rapidly.

Some social norms have a powerful automatic effect on behaviour (e.g. being quiet in a library) and can influence actions in positive and negative ways. Their power may come from the social penalties for non-compliance, or the social benefit that comes from conforming. Behavioural interventions using social norms have been successful in a number of areas, and most are based on telling people what other people do in a similar situation. We draw out five lessons for policy-makers from norms.

1. If the norm is desirable, let people know about it.

In seatbelt use, the 'Most of Us Wear Seatbelts Campaign' used a social norms approach to increase the number of people using seatbelts. Initial data collection showed that individuals underestimated the extent to which their fellow citizens used seatbelts either as drivers or passengers: although 85% of respondents to a survey used a seatbelt, their perception was only 60% of other citizens adults did. An intensive social norms media campaign was launched to inform residents of the true proportion of people who used seatbelts. As a result of the campaign the self-reported use of seatbelt significantly increased.[46]

2. Relate the norm to your target audience as much as possible.

In recycling, when a hotel room contained a sign that asked people to recycle their towels to save the environment, 35.1% did so. When the sign used social norms and said that most guests at the hotel recycled their towels at least once during their stay, 44.1% complied. And when the sign said that most previous occupants of *the room* had reused towels at some point during their stay, 49.3% of guests also recycled.[47]

3. Consider social networks.

Norms may also have important effects in explaining 'contagious' behaviour. There is still controversy surrounding the idea that we are more likely to get fat, for example, if our friends get fat[48] – and get happier if they do[49] – but it is at least plausible that social networks are at play here to some degree. Combined with the appropriate messenger (and other elements of MINDSPACE too), social norms and networks could used to bring about behaviour change that passes through groups and communities.

4. Norms may need reinforcing.

In energy conservation, a large-scale programme (80,000 homes) sent letters that provided social comparisons between a household's energy use and that of its neighbours (as well as simple energy consumption information). The scheme was seen to reduce energy consumption by 2% relative to the baseline. Interestingly, the effects of the intervention decayed over the months between letters and increased again upon receipt of the next letter.[50] In other words, if the norm is not immediately apparent to people, repeated efforts may be required for its effects to become self-sustaining.

5. Be careful when dealing with undesirable norms.

Sometimes campaigns can increase perceptions of undesirable behaviour. When households were given information about average energy usage, those who consumed more than the average reduced their consumption – but those who were consuming less than the average *increased* their consumption. This 'boomerang' effect was eliminated if a happy or sad face was added to the bill, thus conveying social approval or disapproval.[51]

Similarly, messages aimed at reducing bad behaviour can be undermined by the social norms they implicitly signal. For example, two signs were placed in different areas of a national park. One sign urged visitors not to take wood and depicted a scene showing three thieves stealing wood, while the second sign depicted a single thief – indicating that stealing is definitely not a social/collective norm. The first message, subtly conveying a norm, increased the amount of wood stolen by 7.92%, while the other sign increased it by 1.67%.[52] Therefore, policymakers may actually validate and encourage harmful actions by making them appear the norm rather than the exception.

Defaults

We 'go with the flow' of pre-set options

Many decisions we take every day have a default option, whether we recognise it or not. Defaults are the options that are pre-selected if an individual does not make an active choice. Defaults exert influence as individuals regularly accept whatever the default setting is, even if it has significant consequences. Whilst we behave in crazy ways according to the laws of standard economic theory, we behave in predictably lazy ways according to the lessons of behavioural economics.

Many public policy choices have a no-action default imposed when an individual fails to make a decision. This default setting is often selected through natural ordering or convenience, rather than a desire to maximise benefits for citizens. Structuring the default option to maximise benefits for citizens can influence behaviour without restricting individual choice, as the following examples show.

Ventilators are frequently used to help very unwell patients who are breathing insufficiently in Intensive Care Units. Ventilators have settings that allow doctors to decide how much air to blow into the lungs per minute. Doctors usually determine the choice of volumes used and it is recognised that the lungs can be injured if volumes are too high. A research study changed the default setting of the ventilators to provide lower volumes of air into patients' lungs. The mortality rate was 25% lower with the new setting – such an improvement that the trial was stopped early.[53] In addition, there is evidence that the use of opt-out defaults can raise organ donation rates greatly (see Figure 2 below), although this remains a controversial issue.[54]

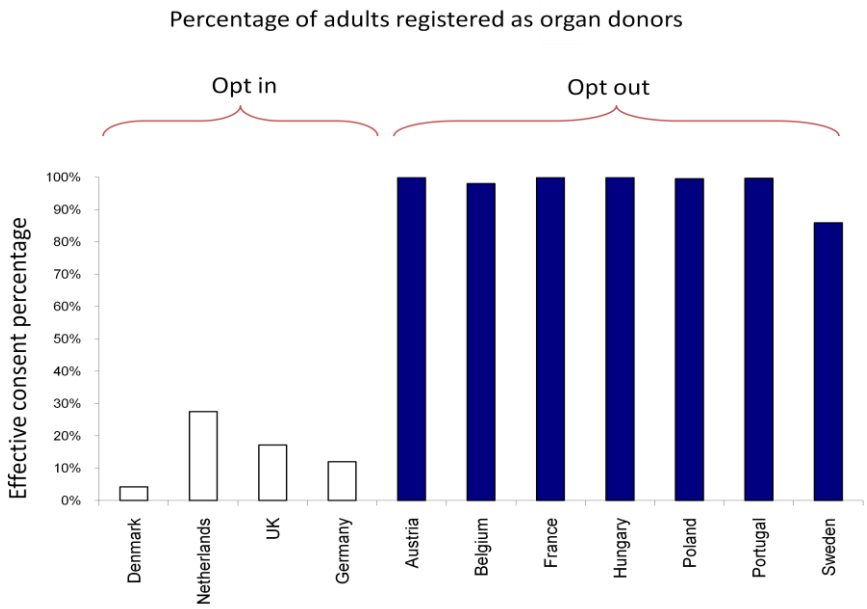


Figure 2: Comparison of organ donation registration in opt-in and opt-out systems[55]

Salience

Our attention is drawn to what is novel and seems relevant to us

Our behaviour is greatly influenced by what our attention is drawn to.[56] In our everyday lives, we are bombarded with stimuli. As a result, we tend to unconsciously filter out much information as a coping strategy. People are more likely to register stimuli that are novel (messages in flashing lights), accessible (items on sale next to checkouts) and simple (a snappy slogan).

Simplicity is important here because our attention is much more likely to be drawn to things that we can understand – to those things that we can easily 'encode'. And we are much more likely to be able to encode things that are presented in ways that relate directly to our personal experiences than to things presented in a more general and abstract way. For example, the size of the current NHS budget is more salient when expressed as an amount per tax payer than as the overall amount. Similarly, because we find losses more salient than gains, we react differently when identical information is framed in terms of one or the other (as a 20% chance

of survival or an 80% chance of death).[57] Here are just some examples of how salience plays out in our behaviour.

In a recent US experiment, researchers chose 750 products subject to a sales tax that is normally only applied at the till, and put additional labels next to the product price, showing the full amount including the tax. Putting the tax on the label, rather than adding it at the till, led to an 8% fall in sales over the three-week experiment. In addition, it has been shown that, over a 30-year period, taxes that are included in posted prices reduce alcohol consumption significantly more than taxes added at the register.[58] Salience may therefore offer a way of complementing traditional price levers in policy-making.

When making a decision, we often lack knowledge about a topic (for example, buying a DVD player). Experiments show that we look for an initial 'anchor' (i.e. a price for a DVD player) on which to base our decisions. It has been shown that the minimum payment amount on credit card statements attracts our attention and 'anchors' our decisions. When a credit card statement had a 2% minimum payment on it, people repaid £99 of a £435 bill on average; when there was no minimum payment, the average repayment was £175. In other words, presenting a minimum payment dragged repayments down.[59] Insights such as this may offer more sophisticated means of regulation.

The power of anchors is such that they work even if they are totally arbitrary. If people are asked to write down the last two digits of their social security number, this 'anchors' the amount they bid for items and their estimates of historical events – even though clearly there is no logical connection between the two.[60]

Anchors endure over time, and continue to influence our decisions long after conditions change.[61] This is related to the well-known 'confirmation bias': people tend to pay little attention to information that challenges an existing belief or hypothesis, and focus intently on any supportive information.[62] Therefore, government advice may have extra power if it acts as an initial anchor, which may be easier to do at moments when people enter a new situation or life-stage (moving house, going to university, pregnancy etc.).

Finally, salience explains why unusual or extreme experiences are more prominent than more constant experiences. Our memory of experiences is governed by the most intense 'peak' moments, as well as the final impressions in a chain of events.[63] In other words, we may prefer the dentist that gave us three hours of steady discomfort over the one who gave us sharp pang of pain, because that pang is particularly salient. Peak effects can, for example, help us predict which medical treatments may be avoided by patients.

Priming

Our acts are often influenced by sub-conscious cues

Priming shows that people's subsequent behaviour may be altered if they are first exposed to certain sights, words or sensations. In other words, people behave differently if they have been 'primed' by certain cues beforehand. Priming seems to act outside of conscious awareness, which means it is different from simply remembering things. The discovery of priming effects has led to considerable controversy, not least to the slightly sinister idea that advertisers – or even governments - might be able to manipulate us into buying or do things that we didn't really want to buy or do.

Subsequent work has shown that primes do not have to be literally subliminal to work, as marketers have long understood. In fact, many things can act as primes, including:

1. Words

- Exposing people to words relating to the elderly (e.g. ‘wrinkles’) meant they subsequently walked more slowly when leaving the room and had a poorer memory of the room. In other words, they had been ‘primed’ with an elderly stereotype and behaved accordingly.[64]
- Asking participants to make a sentence out of scrambled words such as fit, lean, active, athletic made them significantly more likely to use the stairs, instead of lifts.[65]
- One group was asked to think about football hooligans for five minutes, and another about university professors. When they were then given 44 Trivial Pursuit questions, the first set got 42.6% right, the second 55.6%.[66]

2. Sights

- If a happy face is subliminally presented to someone drinking, it causes them to drink more than those exposed to a frowning face.[67]
- The size of food containers primes our subsequent eating. Moviegoers ate 45% more popcorn when it was given to them in a 240g container than a 120g container; even when the popcorn was stale, the larger container made them eat 33.6% more popcorn.[68]
- Deliberately placing certain objects in one’s environment can alter behaviour – ‘situational cues’ like walking shoes and runner's magazines may prime a “healthy lifestyle” in people.[69] In this way, priming can reinforce existing intentions to act in a certain way.

3. Smells

- Mere exposure to the scent of an all-purpose cleaner made significantly more people to keep their table cleaner while eating in a canteen.[70]

These types of effects are real and robust: they have been repeatedly proved in many studies. What is less understood is which of the thousands of primes that we encounter every day have a significant effect on our behaviour.

Priming is therefore perhaps the least understood of the MINDSPACE effects, but has significant implications for policy. For example, it is likely that the environments that government constructs or influences are constantly ‘priming’ people to act in certain, perhaps undesirable, ways. Government should seek the ways it may be unintentionally priming people – or it may seek to ‘build in’ priming effects to its current attempts to change behaviour.

Affect

Emotional associations can powerfully shape our actions

Affect (the act of experiencing emotion) is a powerful force in decision-making. Emotional responses to words, images and events can be rapid and automatic, so that people can experience a behavioural reaction before they realise what they are reacting to. Moods, rather than deliberate decisions, can therefore influence judgments, meaning they end up contrary to logic or self-interest. People in good moods make unrealistically optimistic judgements, whilst those in bad moods make unrealistically pessimistic judgements.

It has been argued that *all* perceptions contain some emotion, so that ‘we do not just see a house: we see a handsome house, an ugly house, or a pretentious house’.[71] This means that many people buy houses not because of floor size or location, but because of the visceral feeling they get when walking through the front door – and may make a better decision as a consequence.

Emotional, rather than deliberative, responses can drive financial decisions. In one experiment, direct mail advertisements for loan offers varied in the deal offered, but also in elements of the advert itself. It was found that the actual advertising content had a significant effect on take up of loans, rather than just prices. In particular, including a picture of an attractive, smiling female increased demand for the financial product by the same amount as a 25% decrease in the loan's interest rate.[72]

Provoking emotion can change health behaviours too. Attempts to promote soap use in Ghana were originally based around the benefits of soap – but only 3% of mothers washed hands with soap after toilet use. Researchers noted that Ghanaians used soap when they felt that their hands were dirty (e.g., after cooking or travelling), that hand-washing was provoked by feelings of disgust. As a result, the intervention campaign focused on provoking disgust rather than promoting soap use. Soapy hand washing was shown only for 4 seconds in one 55-second television commercial, but there was a clear message that toilet use prompts worries of contamination and disgust, and requires soap. This led to a 13% increase in the use of soap after the toilet and 41% increase in reported soap use before eating.[73]

Affect can be very powerful, but should be used with care by policy-makers. In particular, many interviewees suggested it was unhelpful to 'create fear without agency' – in other words, to create an emotional reaction without obviously connecting it to a change in behaviour. Otherwise, people may simply continue with the same actions but with increased anxiety. It has also been argued that people can build up an expectation of being shocked in relation to certain messages, which can make them less effective.[74] A better tactic may be to present these messages in a counter-intuitive manner instead, which points towards to the importance of customer Insight (see page 50).

Commitment

We seek to be consistent with our public promises, and reciprocate acts

We tend to procrastinate and delay taking decisions that are likely to be in our long-term interests.[75] Many people are aware of their will-power weaknesses (such as a tendency to overspend, overeat or continue smoking) and use commitment devices to achieve long-term goals. It has been shown that commitments usually become more effective as the costs for failure increase. One common method for increasing such costs is to make commitments public, since breaking the commitment will lead to significant reputational damage. Even the very act of writing a commitment can increase the likelihood of it being fulfilled, and commitment contacts have already been used in some public policy areas.[76]

People may impose penalties on themselves for failing to act according to their long-term goals.[77] Students, for example, are willing to self-impose costly deadlines to help them overcome procrastination.[78] On a wider scale, it has been shown that people who know they tend to 'live for today' also desire commitment devices. One major study designed a commitment savings product for a Philippine bank, which was intended for individuals who want to commit now to restrict access to their savings. It turned out that Philippine women (who are traditionally responsible for household finances and in need of finding solutions to temptation problems) were significantly more likely to open the commitment savings account than men.[79]

An innovative commitment product has been used to help smokers quit. Individuals were offered a savings account in which they deposited funds for six months, after which they took a test for nicotine. If they passed the test (no presence of nicotine) then the money was returned to them, otherwise their money was forfeited.[80]

Surprise tests at 12 months showed an effect on lasting cessation: the savings account commitment increased the likelihood of smoking cessation by 30%.

To increase physical exercise, commitment to achieving a goal (such as 10,000 steps a day using a pedometer) appears to significantly increase success. An experimental study compared two groups; one group signed a contract specifying the exercise goals to be achieved whilst a control group were simply given a walking programme but did not enter any agreement or sign a contract. All participants recorded daily walking activity for 6 weeks and the contract group were significantly more likely to achieve their exercise goals.[81]

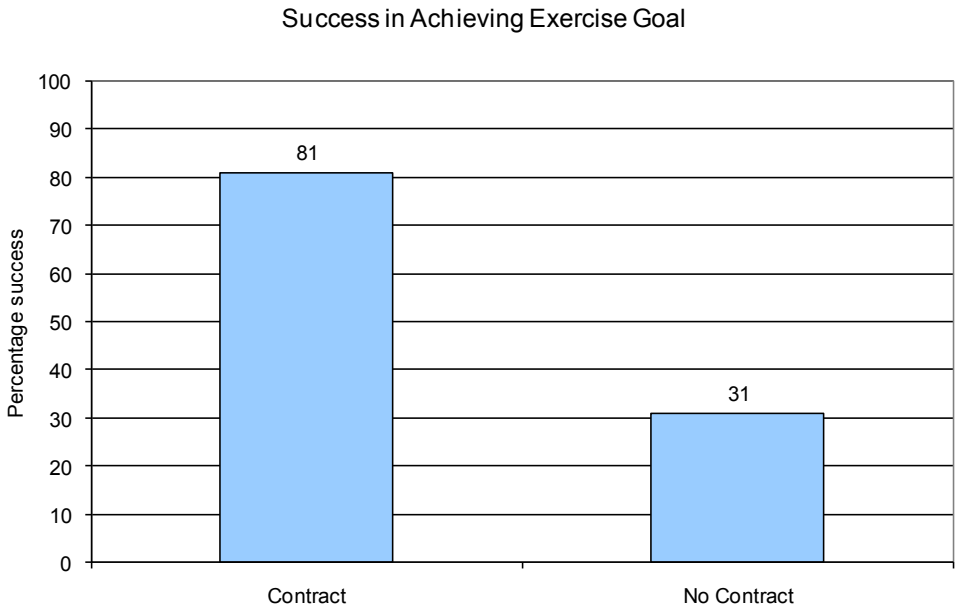

Figure 3: Comparative success in achieving a brisk walking goal for groups with and without contracts

A final aspect of commitment is the importance of reciprocity. We have a very strong instinct for reciprocity, which is linked to a desire for fairness that can lead us to act irrationally.[82] We can see the desire for reciprocity strongly in the attitude of 'I'll commit to it if you do'. Reciprocity effects can mean that, for example, accepting a gift acts as a powerful commitment to return the favour at some point, which is why free samples are often effective marketing tools.[83]

Ego

We act in ways that make us feel better about ourselves

We tend to behave in a way that supports the impression of a positive and consistent self-image. When things go well in our lives, we attribute it to ourselves; when they go badly, it's the fault of other people, or the situation we were put in – an effect known as the 'fundamental attribution error'.[84] We think the same way for groups that we identify with. Psychologists have found this group identification to be a very robust effect, and its power is so great that – like a number of the other effects above – it changes how we see the world.[85] The classic illustration of this effect is sports fans' memories of their team's performance in a match. Fans systematically misremember, and misinterpret, the behaviour of their own team compared with the opponents. A match in which both teams appear equally culpable of committing fouls to an impartial observer will be seen by a partial fan as one characterised by far more fouls by the opposing team than their own.[86]

Advertisers are well aware that we view the world through a set of attributions that tend to make us feel better about ourselves.[87] Male respondents donate more to charity when approached by more attractive female solicitors for door-to-door fund-raising, which suggests that giving is also the result of a desire to maintain a positive self-image (in the eyes of the opposite sex in this case).[88] This suggests that, for example, attempts to reduce smoking should consider if smoking is bound up with a desire for self-esteem and positive self-image, which means self-esteem may be an effective route for change (pointing out that smoking causes yellow teeth and impotence).[89] Of course, this is not a blanket prescription – for people with very low self-esteem, a more effective route may be to build their sense of self-efficacy. This reinforces the need to combine MINDSPACE effects with a nuanced understanding of the capabilities and motivations of the target audience (see Chapter 4).

We also like to think of ourselves as self-consistent. So what happens when our behaviour and our self-beliefs are in conflict? Interestingly, often it is our beliefs that get adjusted, rather than our behaviour.[90] The desire for consistency is used in the *foot-in-the-door technique* in marketing, which asks people to comply with a small request (e.g. filling in a short questionnaire for free), which then leads to them complying with larger and more costly requests (e.g., buying a related product).[91] Once they have made the initial small change to their behaviour, the powerful desire to act consistently takes over – the initial action changes their self-image and gives them reasons for agreeing to subsequent requests ("I did that, so I must have a preference for these products"). In other words, small and easy changes to behaviour can lead to subsequent changes in behaviour that may go largely unnoticed.[92] This approach challenges the common belief that we should first seek to change attitudes in order to change behaviour.

Similarly, it has been shown that the greater the expectation placed on people, the better they perform.[93] Thus, people with positive expectations internalise their "positive" label and succeed accordingly; but this influence can also be detrimental if a negative label is used.[94] A self-fulfilling prophecy is created, whereby people behave in a way that is consistent with the expectation of others.

Our desire for positive self-image leads to an (often automatic) tendency to compare ourselves against others and "self-evaluate".[95] When we make these comparisons, we are biased to believe that we perform better than the average person in various ways: 93% of American college students rated themselves as being "above average" in driving ability.[96] This bias may require policymakers to go beyond what might be considered optimal in regulating some behaviours. For example, it might be necessary to enforce stricter working hour limits for professions that impose risk on others, such as long-distance drivers and medical staff, because people will overrate their ability to cope with fatigue and stress; or set very low levels of acceptable alcohol consumption when driving, because drivers will overestimate their driving skills.

Conclusion

The MINDSPACE framework provides a brief overview of some of the most robust and powerful automatic effects on behaviour, which can be used as tools for behaviour change (in addition to more traditional interventions). These principles are underpinned by laboratory and field research from social psychology, cognitive psychology and behavioural economics. In the next section, we consider how these tools can be applied to several key policy areas.

Examples of MINDSPACE in public policy

The MINDSPACE framework provides a quick overview of some of the most robust and powerful tools that can and have been used to influence behaviour. Here we consider how these tools can be applied to three broad policy areas:

1. **"Safer Communities".** Challenges include: preventing crime, reducing anti-social behaviour, preventing degradation of surroundings
2. **"The Good Society".** Challenges include: promoting pro-environmental behaviours, increasing voting, encouraging responsible parenting
3. **"Healthy and Prosperous Lives".** Challenges include: stopping smoking, reducing obesity, promoting responsible personal finances, encouraging take-up of education and training

We focus on these relatively broad policy areas to reflect some important distinctions that the public and policy-makers may draw between behaviour that affects others and ourselves, and between harms and benefits.[97] Following John Stuart Mill and liberal thinkers ever since, we have often been most concerned about the impact of people's behaviour on others – especially when that behaviour causes harm.[98]

Challenges in relation to **safer communities** fall largely into this category. The most obvious example is the reduction of crime and offending, but it also covers issues such as littering and polluting the environment. In essence, the policy brief is to *stop a behaviour that is harming others*. This is a relatively non-contentious type of behaviour change for governments to take on, and has long been accepted, and even demanded, by citizens. It covers much of the activity of the Home Office, but also that of departments such as the Ministry of Justice and the Department of Energy and Climate Change.

Challenges around the **good society** also relate largely to the impact on others, but typically in relation to benefits rather than harms. Individual citizens may be less able to capture the benefits of such actions, and will tend to 'under-invest' in such behaviours, making a strong case for governments and communities to try to actively encourage them further. Classic examples include behaviours with positive spill-overs such as volunteering, paying taxes and recycling. This involves a big part of the activities of departments such as Communities and Local Government, but also that of Department for Food, Environment and Rural Affairs, Department for Culture, Media and Sport, and several others.

Challenges in **healthy and prosperous lives** also have some effects on others but relate more directly to harm and benefits to the self. This is where the support for government involvement may be weaker, since these types of behaviour are often seen as more within the realm of personal responsibility. Nevertheless, there may be strong financial reasons for acting, such as the Wanless Review's claim that the cost of a population 'unengaged' in its health could be £30 billion more by 2022 than a population actively engaged in taking responsibility for its own health.[99] Classic examples include reducing smoking, preventing obesity and encouraging savings. This type of behaviour change is a major focus of the Department of

Health, but also of departments such as the Department of Work and Pensions and Department for Children, Schools and Families.

Combining a) the goal of the behaviour change, b) the citizens who are affected, and c) the perceived legitimacy of government action creates a flexible framework that covers the major areas of government policy, as can be seen in Figure 4.

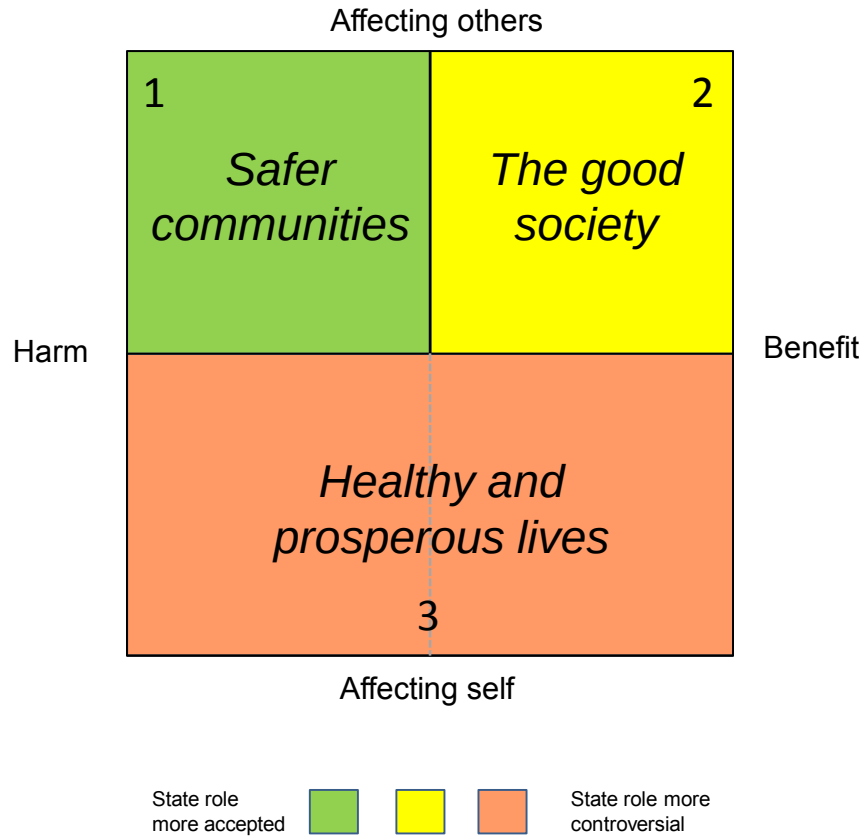

Figure 4: Broad policy areas viewed in terms of behaviour

The following sections show how the behaviour change effects from MINDSPACE can tackle common or pressing challenges under the three broad policy areas of safer communities, good society and healthy and prosperous lives.

We provide a range of case studies that demonstrate how some of the MINDSPACE effects have already been used to change behaviour and cite evidence of their effectiveness. We follow this with an exploration of how other elements of MINDSPACE can be used to influence behaviour in that policy area. These may be evidence-based examples, or suggestions for future policies.

The MINDSPACE framework can also show how policymaking can have unintended and perverse effects on behaviour. Such insights can be as important, if not more so, than the positive examples of MINDSPACE we provide.

In some of the case studies, it may be evident that more than one MINDSPACE effect is influencing behaviour at any one time. While it may be easier to conceptualise these effects as if they work in isolation, in practice significant overlaps will exist. If interventions are well designed, these overlaps are likely to enhance the effectiveness of attempts to shape behaviour.

Safer communities

A key and legitimate role of government is to discourage people harming each other. Much of our legislation and system of justice is aimed at achieving exactly this. We pass laws precluding unacceptable behaviour and look to the courts and criminal justice system to catch and punish citizens who break these laws. But

legislation is far from perfect at affecting behaviour change. Crime and fear remain major concerns in most Western countries and – even in the context of the country's current economic problems – remain one of the British public's top concerns.[100] The following case studies show how thinking differently about criminal behaviour may tackle the pressing challenges it presents.

Case study: reducing gang violence in Strathclyde

The policy issue

The latest British Crime Survey (BCS) reports that violent crime has fallen by 49% since 1995, with provisional data showing 648 murders recorded by the police (the lowest in 20 years). The use of knives in all violent crime has remained fairly stable over the last decade.[101] Although gun crime remains very rare, the number of recorded crimes involving firearms (excluding air weapons) doubled between 1998/9 and 2006/7.[102] And there is considerable public concern about knife and gun crime: 93% of BCS respondents thought knife crime had risen nationally, with 86% thinking the same for gun crime.[103]

Many of these concerns have related to the activities of 'gangs'. It is extremely difficult to measure gang membership, but a 2004 Home Office study estimated that 6% of young people aged 10-19 belonged to a delinquent youth group.[104] Offending rates were significantly higher for members of these groups than for non-members, and 51% claimed to have taken illegal drugs with other members.[105]

Using norms and messengers to change behaviour

It has been shown that people are strongly influenced by the behaviour of others, particularly by those who are similar to themselves. If delinquent behaviour is seen as 'normal' and widely practised by peers, this creates a strong attraction for gang members to join in and conform to the norm.

Scotland's Violence Reduction Unit has taken an innovative approach to tackling Glasgow's gang culture, which is founded on turning the power of social norms *against* gangs. Previous initiatives – including foot patrols and crackdowns on knife crime – had achieved only short-term success.[106] Then Scotland's Violence Reduction Unit turned to a US programme called the Cincinnati Initiative to Reduce Violence (CIRV). A central plank of CIRV's approach is to make one gang member's actions affect all his/her peer group. So, if a gang member commits a murder, then the entire gang is targeted for offences: drug activities, weapon possession, and parole and probation violation. In other words, punishment is replicated in the same way as the delinquent behaviour was – through the social norm of gang membership.

The American programme adopts other tactics for 'changing operative norms regarding violence'. Gang members were summoned to face-to-face forums as a condition of their parole. One purpose of these forums was to show how the gang's 'rules' or 'code' was based on illusion and rarely operated in reality. The other main purpose was to draw on wider social norms, by getting members of local communities, victims' relatives and ex-offenders to speak about the impact of the gang's violence on their area.

The messages have proven most effective when coming from figures that gang members may respect, or to whom they can relate – as when the mother of a dead gang member warned: 'If you let yourself get killed, your mother will be standing here. She will be me.'[107] As one of the American scheme's architects has noted, 'We're finding all of this matters more if you can find someone who is close to the offender, who they respect, who will

reinforce these values.'[108] This points again to the power of the 'Messenger' effect, explained above.

Evaluation

There have been a series of gang violence initiatives, all based on a similar model from the United States. One of the first programmes, Ceasefire, has been well evaluated. When first launched in Boston in 1996, an evaluation for the US National Institute of Justice found that the intervention reduced the average number of monthly youth homicides by 63%.[109]

A more recent evaluation of a programme based on the Boston project found that shootings and killings dropped between 41% and 73% in Chicago and Baltimore; declines of between 17% and 35% were attributable to Ceasefire alone.[110] In Cincinnati, gang-related homicides fell by 50% in the first nine months.[111] These improvements appear to be enduring – once a new social norm has been embedded, it becomes self-sustaining.

Scotland's Violence Reduction Unit secured £1.6 million of funding for their own CIRV (Community Initiative to Reduce Violence) project in 2008, which has brought together workers from many different agencies (including housing, education, social work and justice). The first face-to-face forum was only held in October 2008, with the first year's results published at the end of 2009.[112] The Home Affairs Select Committee recently praised Scotland's Violence Reduction Unit's 'innovative' strategy in its report on knife crime.[113]

Thinking through the MINDSPACE framework offers many possible ideas for policy to reduce crime and make our communities safer.

M

Messenger

Our reaction to information that specifies what is, and what is not, socially and legally acceptable is often influenced by the messenger delivering it. In reducing criminal activity, some people will respond better to authority figures, whilst others are more sensitive to messages delivered from people with similar backgrounds. The messengers used by the London borough of Brent to deliver information successfully to youngsters about the risks of becoming involved in gun crime were youth officers who were previously in street gangs.[114] BAC-IN, based in Nottingham, is run for and by people from African/Caribbean and South Asian backgrounds that have drug and alcohol problems. It provides culturally appropriate peer support to address and treat substance misuse problems in communities where abuse is often hidden and denied.[115]

There is strong evidence that the persuasive impact of close personal relationships on behaviour and family and friends can be used to deliver messages that seek to reduce criminal activity.[116] The Ceasefire programme, for example, uses mothers to deliver messages to gang members. One idea, raised at a recent Prime Minister's Strategy Unit seminar, is the practice of local mothers joining the police on the beat in housing estates blighted by anti-social behaviour. Such interventions not only strengthen the messenger (on both sides), they also help strengthen the establishment of stronger local social norms.

I

Incentives

Behaviour shaping, such as in relation to troubled youth, is often best done through positive incentives – in other words, rewarding and encouraging pro-social and adaptive behaviour rather than negative incentives (penalties) for bad behaviour. Hence effective parenting programmes focus heavily on helping the parents of troubled youngsters to praise and encourage sometimes quite small steps towards

positive behaviour (such as not leaving shoes lying around, or clearing plates from the table).

Whether using incentives as a reward for positive behaviour or as a penalty for bad behaviour it may be useful to consider loss aversion (the phenomenon that individuals prefer to avoid losses than acquiring gains). It is likely that sanctions, such as fines, are likely to be more effective when framed as losses. For example, the threat of crushing an offender's car (as represented in DVLA adverts) or taking their new TV could be more powerful than a fine of the equivalent level.

N

Norms

Social norms are a very powerful driver of both minor and more serious forms of crime. Essentially, we often take our cues for 'what goes' from those around us. Hence if one or two people start vandalising an abandoned car, others are likely to join in.[117] Even amongst highly educated members of society, the propensity to cheat is influenced by pervasive local norms.[118]

As noted in the case study, Ceasefire uses norms extensively, in this case partly trying to lever the social capital of the gang to less negative ends. This can work in the other way, however, with custodial sentences in certain circumstances being associated with higher rates of recidivism. It may be that custodial sentences break an individual's remaining exposure to mainstream social norms and instead immerse them in a crime-based set of norms and social networks. A more positive example may be youth or teen courts, where young volunteers serve in various capacities within the programme. There is evidence from the USA that these can be highly effective. These seem to rest on several factors, a key one being that young people are especially sensitive to the social norms and influences of their peers.[119]

D

Defaults

"Target hardening" – for example, making products harder to steal - offers an increasingly familiar and effective form of harnessing the power of defaults. For example, ensuring that mobile phones come with security passwords already enabled or building cars that automatically immobilise the engine make successful crimes more difficult. Such phones can still enable users to override the default, but the chances are that most users will be happy with the default extra security in place, just as they would have been without it. Speed limiters in cars (that could be actively overridden) could work in the same way.

S

Salience

In general, the more the message or signal is specific and salient to us as individuals, the more powerful it is likely to be. For example, campaigns to encourage people to drive more carefully or lock up their houses will be more effective if they are segmented to match the audience. Hence, a speeding campaign is more likely to be effective when tailored to young drivers and other at-risk segments, and 'lock-up' campaigns when rooted in statistics about burglaries on your own street. Again, the recent Cabinet Office report on segmentation provides practical advice in this area.[120]

Salience can also be applied to help public policy in more indirect ways too. For example, recent evidence in the UK suggests that visible jackets and salient 'unpaid work' can boost confidence in community punishment.[121] This increased confidence may provide a platform for policymakers to move the UK criminal justice system away from use of custodial sentences towards the greater use of community sentences that appear to work well, and be publicly acceptable, in our Northern European neighbours.[122]

P Priming

Criminal activity can be made more likely by factors in the environment that 'prime' an offender's behaviour. The 'Broken Windows' theory suggested that if a few windows of a derelict factory were not repaired, the tendency was for vandals to break a few more. As such 'one example of graffiti or littering, can indeed encourage another, like stealing'.[123] Further work has shown that the sight of guns can induce aggressive ideas and 'can function as a conditioned stimulus, eliciting both the thoughts and motor responses associated with its use'. As a result, it has been said that whilst 'the finger pulls the trigger, the trigger may also pull the finger'.[124] Hence, policy-makers should consider how the wider visible environment in which people live may actually prime crime.

A Affect

Restorative justice is a process where parties with a stake in a specific crime work together in dealing with the aftermath of the offence and its future implications. Bringing offenders face-to-face with their victims can evoke a strong emotional response – such as anger and guilt - in participants. The youth offending team in Caerphilly believe that their restorative justice scheme empowers victims and can reduce crime.[125]

Of course, much of the impact of crime comes from the powerful negative emotions it generates, not just directly for victims but because of the pervasive sense of fear that it can engender. It can be challenging to value the psychological cost of crime[126] but we know that fear of crime can affect our behaviour, which can lead to withdrawal into the home and abandonment of public space. Community building – getting to see and know your neighbours – can be an effective way of reducing fear. A common response of fearful residents brought together is the relief when they discover they are not alone.

C Commitment

Policy-makers and those working in the criminal justice system should consider how the power of commitment could reduce or prevent undesirable activities. Acceptable Behaviour Contracts (ABCs) are a good example of the use of commitment devices in relation to crime. A meeting is held between the offender, their parents (if applicable) and the police and all agree what is and is not acceptable behaviour. Though there is no legal sanction, ABCs can nevertheless be effective in reducing antisocial behaviour.[127]

Although reciprocity can sometimes be a powerful negative force, such as tit-for-tat exchanges between rival gangs, commitment contracts could be enhanced by strengthening their reciprocal element. It may be useful for the partners of the agreement to recognise when the contract has been successful and respond, with positive feedback or reward.

E Ego

The quest for a positive self-image is important for most of us but may be particularly so in persistent criminal offenders. Research into the causes of violent acts has traditionally focussed on risk factors rather than perpetrators' perspectives on their actions. Violent crime in particular, is often entangled with a struggle for 'respect', and there is evidence that violence often relates to (arrogant or aggressive) protection of low self-esteem.[128] The recent, and much quoted, Australian campaign to reduce speeding by young men openly plays on this desire for respect: an attractive young woman raises and bends her finger to signal that she thinks speeding a sign of having a small penis.[129] Similar campaigns could be launched to reduce the drink-related violence seen in many town centres at night, often carried out as a sign of machismo.[130]

In contrast, the ever-popular but highly ineffective practice of 'scaring straight' by taking young people to prison may fail because it makes it easier for the young person to think of themselves as an offender, and to incorporate this into their identity. The evidence indicates that it actually increases subsequent offending.[131] Similarly there are concerns that anti-social behavioural orders (ASBOs) are sometimes treated as a 'badge of honour' in some social groups and may cue bad behaviour rather than restrain it.[132]

Case study: Reducing littering in Southwark

The policy issue

Citizens consider the appearance of their local area as a major issue, and litter is perceived as the second biggest blight on the local environment.[133] Government attempts to alleviate these problems are considerable: the estimated cost of street cleaning was £547 million in 2005-06.[134] At a local level, polling data in the London Borough of Southwark has indicated that residents considered street cleanliness to be the council's main priority. By 2007, the council was spending approximately £20 million cleaning streets and housing estates.[135]

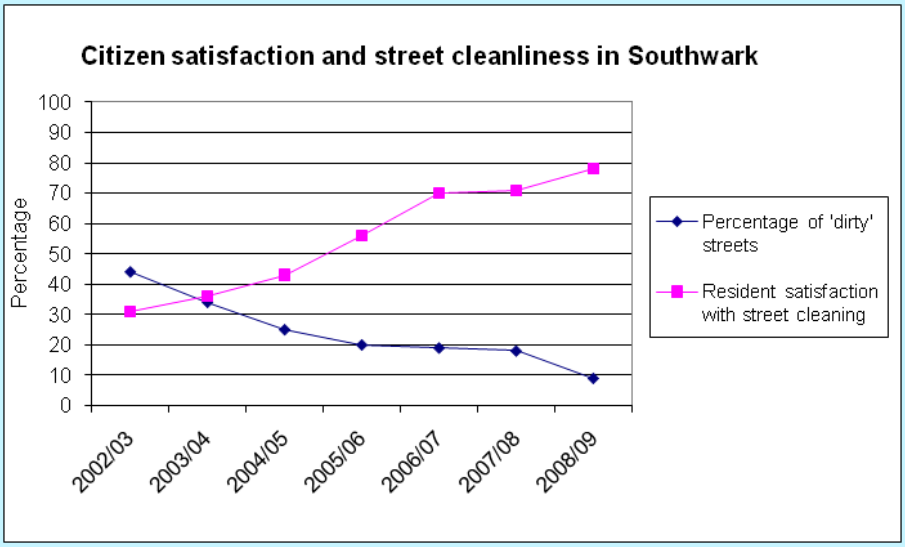
Using norms and salience to change behaviour

Given public concern and government spending, littering presents a strong case for attempting to change behaviour to prevent harm to others. Southwark applied incentives to reduce littering by introducing £75 fixed penalty notices (FPN). These notices are obviously more effective if people are aware of them – which is why Defra recommends they are preceded by an awareness-raising campaign.[136] But, just as concern about litter in general may not translate to changed behaviour in practice,[137] there are some real challenges to making the abstract threat of a fine 'real' to citizens.

Starting in 2004, Southwark adopted 'Stalking Litter', an innovative approach to making the issue of litter, and FPNs specifically, more salient to citizens. In order to attract attention, the council hired actors in giant litter costumes to 'create a scene' in busy streets throughout the borough. The actors (later replaced by staff members) explicitly aimed to engage with the public, for example by cheering and thanking passers-by who put litter in nearby bins.

There are three main advantages to exploiting salience in this way:

a) The novelty and amusement of the giant litter provides a salient opening for the serious messages about litter problems and FPNs. As one participant argued, 'It's hard to get your message across if you have a leaflet in your hand. Dressing as a giant banana gives you a 10 to 15 second window where people listen to you.'



b) The costumes connect the issue of litter and FPNs with distinctive visual images. Not only do the images exploit non-verbal means of communication, their novelty makes it more likely that the accompanying message will be retained.[138]

c) The costumes were explicitly designed to represent the most common types of litter found in Southwark (for example, coke cans, fast food, and cigarettes). These similarities are likely to make the actual litter that citizens encounter more noticeable, and to make them more aware of their own littering behaviour.

Evaluation

The programme has not been formally evaluated. There are informal reports that the novel approach was successful at tackling the apathy surrounding littering, while the use of humour appealed to groups who may have not responded to traditional information campaigns. The campaign was cited in Southwark's 'Overall Winner' title at the Cleaner Safer Greener Network Awards in 2006.[139] Naturally, it is very difficult to make a causal link between the use of Stalking Litter and the incidence of littering, since the initiative took place as part of a wider programme aimed at improving the cleanliness of Southwark. Nevertheless, holistic programmes to change littering behaviour can achieve significant effects, as indicated in the graph below.[140]

The good society

Nearly everyone wishes to live in a 'good society', even if different people tend to emphasise different things when defining it. Government often intervenes to promote a better society, and may be seen to have legitimacy to do so if people believe civil life has deteriorated. Although very few people when questioned want the state intervening more in their lives, they are likely to give permission for new policies in this area if the benefits are made salient to them.

Case study: Education-Related Parenting Contracts

The policy issue

Most people agree that parents need to be able to guide and nurture their children and discipline them when necessary. As part of this, parents are expected to support schools in making sure their children attend class regularly and behave appropriately whilst there. In the Autumn 2008 and Spring 2009 terms, unauthorised absence statistics show that 1.03% of the half day school sessions were missed without permission. In the 2007/8 academic year, there were 8,130 permanent exclusions from primary, secondary and special schools in England, which represents 0.11% of the number of pupils in schools. The most common reason for exclusion was persistent disruptive behaviour.[141]

Using commitment contracts to change behaviour

Education-related Parenting Contracts and Parenting Orders were introduced in February 2004 to promote and reinforce parental responsibility

for school attendance and behaviour. An education-related Parenting Contract is a voluntary, written agreement between a parent and either the governing body of a school or a local authority. Parents cannot be compelled to enter into a Parenting Contract and there is no obligation for local authorities and schools to offer them. The contract includes a statement and a commitment by the parents that they agree for a specified period of time to comply with the requirements set out in the agreement. Parents in many cases are encouraged to suggest their own solutions as to what measures would be most effective. The school or local authority provides a statement and similar commitment agreeing to provide support to the parents to improve the child's behaviour and/or attendance. Support ranges from the family being bought an alarm clock to parents being offered a place on parenting skills courses.

After the Parenting Contracts have been signed off, an initial period of time is usually given for the pupil's behaviour or attendance to improve. If there is little or no improvement then the period of the contract can be extended, with both sides' agreement. There is no sanction for a parent's failure to comply with or refusal to sign a Parenting Contract. However, if the pupil's misbehaviour or attendance continues or worsens and the school or local authority applies for a Parenting Order (a civil order), then the Court can take non compliance with the Contract into account when considering whether to grant an Order. In the case of poor school attendance the local authority may consider prosecuting the parent, but this should be the last resort.

Evaluation

In 2008, a DCSF-commissioned evaluation of education-related Parenting Contracts assessed their role in improving children's behaviour and reducing unauthorised attendance.[142] The evaluation showed that there was a greater use of Parenting Contracts for attendance problems rather than for bad behaviour. The trigger for contracts due to poor attendance usually occurred when unauthorised absences dropped below a specific level. For bad behaviour, parenting contracts were often used as a last resort attempt when other interventions had failed.

Schools, local authorities and parents were generally positive about the role of Parental Contracts in reducing non-attendance and improving behaviour (see Figure 6). The majority of schools involved in the evaluation saw attendance improve as a result of using these agreements. Although a fewer number of contracts were used for bad behaviour, it was considered very difficult to isolate their effectiveness, as a number of other interventions were often running concurrently. However schools and local authorities did feel that Parenting Contracts had helped to avoid the child in question being permanently excluded and that generally, their behaviour had improved.

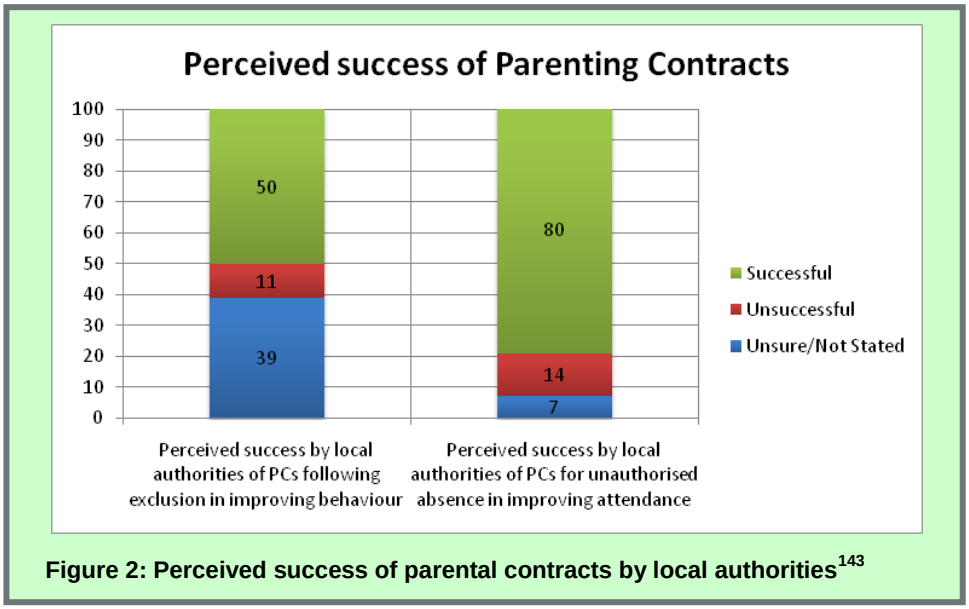


Figure 2: Perceived success of parental contracts by local authorities[143]

Messenger

Although much of the new legislation enacted in the last few years is uncontroversial and would have widespread support, some people may not approve of government interventions to encourage pro-social behaviours. Therefore, in delivering messages that seek to create a good society, it may be more effective to use messengers that are not seen as agents of the state. Currently, there are a number of public campaigns, such as those for filing tax returns or increasing recycling, that currently use public – and non-governmental - figures to get the message across.

Peer to peer programmes can be used to target youngsters who are often hard to reach, with messages intended to enhance pro-social behaviours. As part of the Aimhigher programme, a scheme has been established in which secondary school pupils are mentored by university students to support them in continuing into higher education programmes.[144] Peer education programmes have also been used to increase the youth vote, with organisations like 'Rock the Vote' using the power of peer messengers to increase voter turnout recent American elections.

Incentives

Providing incentives to promote pro-social behaviours can risk reducing people's intrinsic motivation to make the right decisions in other areas of their lives. Intrinsic motivations come from the reward from carrying out the task itself, the feeling of satisfaction or self-worth that comes from an act of altruism. Extrinsic motivation comes from outside and usually takes the form of coercion or a financial reward or penalty. It has been shown that extrinsic incentives relate to how people see themselves and are therefore less effective in public than in private. For policy-makers, this would suggest that monetary incentives are more likely to be counterproductive for public pro-social activities than for private ones.[145]

One area in which communities have grown in strength over recent years is online. Wikipedia is an example of a social resource that has come together with the help of a community of hundreds of thousands of editors who are not rewarded for their contribution financially. So what incentivises these people to contribute? It has been suggested that the motivations for contributing to such websites was not always strictly altruistic, but relied on increased recognition, a sense of efficacy and anticipated reciprocity.[146] Incentives may have a role in many areas of public policy making, but other factors may be as or more important that financial rewards or

penalties. Policy-makers should therefore try to identify whether there are any intrinsic, altruistic motivations that could be harnessed for behaviour change.

N

Norms

People have been seen to contribute more to society and public goods when they see others contributing as well.[147] This behaviour may be due to the specific norm of 'responsibility' generated when people recognise the impact their personal behaviour has on creating a better society. The theory of responsibility-orientated contribution to society differs from other explanations of pro-social behaviour, such as reciprocity and conformism, which also influence actions. In the setting of a Norwegian recycling programme, perceived responsibility was found to be a major determinant for reported recycling: an individual less certain that their neighbour was recycling was less likely to accept responsibility for their own recycling.[148] It seems that people determine appropriate pro-social contributions by looking at their peers' actions.

Encouraging voter turnout is a priority for healthy democracies. The 'Voter Paradox' describes the fact that in spite of the economic prediction (rational model) that very few people would turn out to vote, significant numbers continue to do so. There are a number of reasons for observed voter behaviour but a strong social influence certainly exists. The British Election Survey found that, controlling for all else, if a person believes that his or her peers think that voting is a waste of time, that person is less likely to vote.[149] To boost voter numbers, postal voting has been introduced in many countries. When optional postal voting was introduced in Switzerland, it reduced voting costs substantially but did not increase turnout. Interestingly, voter turnout actually decreased in smaller communities.[150] It has been suggested that this reduction was because the social norm of being seen to vote was lost. This implies that policy-makers should pay particular attention to encouraging or enabling a *visible* pro-social norm to take root in communities.

D

Defaults

Default payments or top up fees can be added to products which are then donated to projects promoting a 'good society'. The change of default from one in which the customer has to opt into making the additional payment to one in which they must opt out can dramatically influence behaviour. To maintain public parks in Washington State, drivers renewing their licenses are charged an additional $5 donation unless they opt-out of not paying the fee. This has increased the amount donated compared to the old system, where people were not charged the fee unless they chose to pay it. In the previous model, only 1.4% of people donated, with the State collecting just over $600,000 dollars a year. The state has reported making over $1million dollars a month from the scheme since the change.[151]

Some organisations (for example, the ZSL London Zoo) now include a Gift Aid contribution as a default in their standard prices, and this technique could be encouraged for other causes promoting a 'Good Society'. Or optional payments could be added to products that lead to external costs to society: for example, some airlines already operate an opt-out default payment to offset the carbon footprint associated with flying. This has implications for policy-makers either concerned with raising revenues in a non-compulsory manner, or with more nuanced ways of regulating and adjusting for market failures.

S

Salience

Choice overload refers to the problem some consumers face when they are presented with too many options. Too many choices can lead to people making poor decisions and may even lead to people refraining from making any choice at all.[152] As an example, people can sometimes be overwhelmed by the range of options they have for recycling their waste and may consequently choose not to

recycle at all. Better design could simplify the process by making recycling choices more salient. Colour coded container lids increased the recycling rate by 34% in one experimental study, suggesting that the lids colour communicated information effectively through salience, thereby improving recycling compliance.[153]

P

Priming

Original research on priming and social behaviour found that exposure to songs with 'pro-social lyrics' increased altruistic helping behaviour.[154] Further studies have shown providing participants with a picture of a library caused them to speak more quietly.[155] Features of our environment may be able to prime pro-social behaviour; however, more research evidence is needed before such interventions could be recommended.

A

Affect

Social marketing is the application of commercial marketing techniques to influence the voluntary behaviour of target audiences and improve personal and societal wellbeing.[156] Many social marketing campaigns have used the power of affect or emotion to stimulate behaviour change. Drink driving and seatbelt awareness campaigns are good examples of where social marketing campaigns have played a part in significantly changing behaviour. Social marketing that draws on the power of affect could be used to encourage other pro-social behaviours such as blood donation and community volunteering.

C

Commitment

The internet site www.stickk.com enables users to form commitment contracts to help them achieve personal goals such as losing weight and stopping smoking. The internet also provides a forum for people to make commitments to enhance their local community. Pledgebank.com is a site where people are able to commit to doing things in their community. Users set up pledges and other people are encouraged to sign up to them. If the pledge attracts enough people then the group is encouraged to go forward with the idea. Current examples include 'I will start recycling if 100 people in my town do the same' and 'I will organise a love music, hate racism event in South London, but only if 10 other people will help out'.

Reciprocity can be used as a mechanism to improve social cooperation through citizen-to-citizen support schemes. The basis for such programmes is that people can earn credits for pro-social behaviour in their local community. The idea comes from Japan, where a cashless currency (*fureai kippu*) or 'caring relationship tickets' has been established. In the scheme, people are able to earn credits for looking after an elderly neighbour, which can then be used to purchase similar care for elderly relatives who live a significant distance away. A similar programme could be established in the United Kingdom.[157]

E

Ego

Community improvement needs strong involvement and support. Enhancing the status of individuals who contribute to enhancing their local communities may encourage more people to take an active part. 'Community Champions' is an umbrella term, used by a number of organisations to describe people that work to improve the environment in which they live or work in. For example, 'Community Champions' in Braintree inform the council about abandoned vehicles, graffiti, vandalism and street lights that have gone out.[158]

The Honours system has been used in recent years to recognise people who have made significant contributions to their local communities. It may be beneficial to create a more formal national award for young people and recent immigrants who have already made a substantial contribution to their communities, but who may not currently be recognised by the Honours system.

Case study: Increasing recycling through deposit schemes

The policy issue

The United Kingdom consumed approximately 14 billion litres of soft drinks in 2007, equivalent to around 234 litres per person. In the same year nearly 24 billion beverage packaging units were sold.[159] Recycling rates of such products is markedly less in the United Kingdom compared to other countries in Western Europe.[160] In Denmark, a combination of a bottle deposit scheme with a network of Reverse Vending Machines (RVMs) has seen return rates of 84% for cans, 93% for plastic bottles and 91% for glass bottles.[161]

Using incentives and loss aversion to change behaviour

There is no doubt that better facilities have contributed to improved household recycling. One area where recycling rates remain poor, however, is in the recycling of products purchased 'on the go' (e.g. soft drinks containers). Deposit schemes are used in many countries to encourage people to return empty packaging, and there is evidence they can reduce littering.[162] The basic principle of the scheme is that consumers pay an additional fee to the retailer when purchasing a bottle or associated packaging. The deposit is refunded when the consumer returns the empty packaging. In a recent survey, 82% of people in the United Kingdom polled said they would support a scheme whereby at least five pence was included in the price of every drink container, with the deposit returned for recycling.[163]

There are a couple of examples of incentive schemes that have been used in the United Kingdom to improve recycling rates. IrnBru, which is manufactured by AG Barr, is available in refundable glass bottles. Empty bottles can be returned to retailers, who provide either cash refunds or a credit voucher. The current deposit value is 30p, and an impressive 70% of bottles are returned for cleaning and reuse.[164]

Reverse Vending Machines (RVM's) are devices that accept empty beverage containers and can return money to the user. RVMs vary in size and their price ranges from a few thousand pounds for smaller receptacles to tens of thousands of pounds for larger units that can handle many thousands of bottles a day. An organisation called Recoup have been involved in a number of trials of RVMs, including one in Milton Keynes. Initially no incentive was offered to encourage the public to recycle using the RVM but an incentive has recently been introduced. These voucher-based incentives have not been seen to cause a significant effect on recycling behaviour. Another scheme by The Body Shop offered its customers a 10% price reduction if they returned containers to the shop for refilling. The scheme was dropped because only 1% of shoppers were using it.[165]

There may be a number of reasons why IrnBru and other bottle deposit schemes have been effective, whilst other programmes have been less so. Behavioural economics provides us with one potential answer - loss aversion. Loss aversion is the theory that states that losses loom larger than corresponding gains and subsequently have a greater effect on preferences. It is likely that part of the success of deposit schemes lies in generating loss aversion in consumers. When customers hand over their deposit, loss aversion predicts that failure to return the bottle and collect the payment back will trigger a larger psychological cost than the monetary value of the incentive would suggest. For this reason, deposit schemes may have a more powerful effect on consumer behaviour than simple incentives alone.

Evaluation

Environmental Resources Management Limited (ERM) was commissioned by DEFRA in 2008 to investigate whether a bottle deposit scheme should be introduced in the United Kingdom. The findings of the evaluation were that deposit schemes increase return rates in countries using them (often reaching rates of over 85%) and that they may also contribute to reductions in littering. ERM summarised that whilst it is not disputed that a deposit scheme would increase recycling, alternative schemes may achieve similar or better results at less cost.[166]

A subsequent report from DEFRA suggests that there is unlikely to be a national deposit scheme rolled out in England in the foreseeable future.[167] Such a scheme may be seen elsewhere in the United Kingdom, however, and The Climate Change (Scotland) Bill contains powers to introduce deposit and return schemes.[168] It may also be that retailers themselves take on the responsibility for establishing bottle deposit schemes, and both Sainsbury's and Tesco have already tried this in various guises.

Healthy and prosperous lives

A central goal of policymakers is to make citizens healthier and more prosperous. Countless years of life continue to be lost as a result of the disease burden from unhealthy choices. Similarly, the penalties of poor financial decision-making can adversely influence individual and societal well-being, in the short and long term.

People should be encouraged and supported in making healthier choices if they wish to, but there can be opposition to government involvement with these issues.[169] Altering the choice environment with no restriction placed on individual choice may provide an accepted way for policy-makers to influence behaviour in these areas.

Case study: increasing contraceptive use

The policy issue

There are currently more than 33 million people living with HIV globally. Sub-Saharan Africa remains the region most heavily affected by HIV worldwide, accounting for over two thirds (67%) of all people living with HIV and for nearly three quarters (72%) of AIDS-related deaths in 2008. Women are significantly more likely to contract HIV: throughout the region, women account for 60% of all HIV infections.[170] HIV clearly has important consequences for those infected and for wider society in terms of carer burden, lost output, etc. In an attempt to stem the epidemic, DfID has committed £6 billion over seven years to 2015 to improving health systems in developing countries.[171]

As the UK's AIDS strategy for developing countries notes: 'Successful HIV prevention is about enabling individuals, couples and communities to make healthy choices about personal aspects of their lives – particularly sexual behaviour. These are not just based on information and rational choice; they are also influenced by complicated drivers of human action, including gender roles, inequality, norms around sexuality...'[172] A key plank of the strategy is increasing awareness and use of condoms. But DfID has also recognised the need to incorporate the 'complicated drivers' around how we deal with information – in particular, the importance we attach to the *messenger*.

Messengers

The weight we give to information depends greatly on the feelings and thoughts we have about its source. This principle is the foundation of the DfID-funded 'Get Braids Not Aids' campaign in Zimbabwe, which is one of the countries that has been worst hit by the virus.[173] The scheme trains hairdressers in low-income areas in informing their clients of the benefits of female condoms, how they are used and how to introduce them into a relationship.[174] This means the information is being provided by a familiar person in a friendly, supportive and safe environment, which helps overcome the stigma attached to female condoms and means the women feel freer to talk about their personal issues. Also, associating female condoms with a friendly person or enjoyable experience may lead them to be perceived in a more positive light as a whole.[175]

Evaluation

By 2005, 'Get Braids Not Aids' had a network of 1,000 hair dressers in 500 salons, which sold 450,000 female condoms.[176] This represented over half of total sales of female condoms in Zimbabwe, which have increased dramatically since 1997.[177] A DfID-funded study amongst 400 hair salon clients found that women who had seen a female condom demonstration by a hairdresser were 2.5 times more likely to use the product than those who had not.[178]

The study found that 28% of respondents reported using the female condom (called *Care*), compared to only 15% in 2002. 35% of respondents spontaneously reported hair salons as a source of information about *Care*, while 47% said they had specifically talked about *Care* with their hairdresser.[179] There are questions, however, over the sustained use of female condoms, since it appears that half of the women who purchased the female condom only used it once.[180]

Given the various complicating factors, it is not possible to draw a causal link between this programme and AIDS prevalence. However, a recent United Nations report attributes the significant decline in HIV prevalence in the last decade to mortality and 'a decline in HIV incidence due to behaviour change'.[181]

M

Messenger

We usually think of parents moulding or influencing their children's behaviour, but children similarly influence parents and other family members. A series of Department of Health adverts have been used featuring children conveying the health risks of smoking to their parents. There may be a wider role for personal health messages to be delivered by family members to other relatives. Teenagers learn about healthy living as part of the social and health education programmes that form part of their school curriculum. Teenagers of a certain age could be encouraged to provide health information to relatives (e.g. grandparents).

I

Incentives

Payments for gym membership leave many people's bank accounts without a foot stepping on the treadmill. A Danish chain of gyms is offering a new way of encouraging its members to visit the gym regularly.[182] The gym offers free membership, with the only condition being that if you fail to show up once per week you will be billed a monthly membership fee. Traditional gym subscriptions (annual subscriptions) can be considered in many ways as 'sunk costs'. In economics,

sunk costs are those that have already been incurred and cannot be recovered. Whilst these costs will still motivate the gym member, the Danish scheme is likely to be more successful (in terms of increasing usage, if not profit), since it will generate continuing feelings of loss aversion for failure to go to the gym.

General Practitioners are now prescribing a variety of exercise programmes to their patients, including gym memberships and golf lessons.[183] The rationale is that this will offer preventative health benefits, but it has generated controversy and the effectiveness of such schemes is not yet proven. A system that allows people to access similar free facilities could use the Danish model that only results in costs to participants if they do not keep to their targets.

N

Norms

The decision to smoke or drink alcohol is heavily influenced by the choices of those around us. Recent evidence suggests that the outside forces that make one person's smoking less likely will also decrease the probability that close friends or family will also smoke. It was demonstrated that individuals whose spouse was faced a workplace smoking ban were less likely to smoke themselves and that a spouse quitting can lead to a 40% reduction in the probability of spousal smoking. This evidence suggests that policy interventions affecting an individual's behaviour (e.g. workplace smoking bans) may have an additional indirect effect on their peer group.[184] This may increase the legitimacy of policies that are used to target other unhealthy behaviours.

D

Defaults

Nudges can also use technology to deliver desired changes in behaviour. Statistics suggest that there may be a group who repeatedly flout drink driving laws.[185] A new approach may be needed to deal with this group of persistent offenders. In certain American states, those convicted of drunk driving have to install breath-monitoring gadgets in their car, which prevents engines from starting until drivers blow into alcohol detectors.[186] There is of course the risk that drivers get their sober friends to blow into the device, but strict penalties have been introduced to counter this tactic. Such a scheme (acting as a default) could be used in the United Kingdom to reduce the damage done by these repeat offenders to themselves and others.

S

Salience

Traditional economic theory tells us that price is supposed to capture, rather than shape, value. Recent behavioural research suggests that preferences can be affected by how a price is presented or framed.[187] The most obvious example is that consumers are affected by setting prices just one penny below the nearest pound value, since the pound value comes first and is thus more salient.[188]

In recent years firms are increasingly displaying their prices not in terms of a single price, but as a breakdown of separate charges. Examples include online retailers who provide their price separated into product cost and handling and postage fees and airlines who now routinely itemise fuel fees, baggage charges and landing fees.[189] Consumers are often confused as to what products offer the best value. This has been seen in the travel industry, where there are increasing complaints about the transparency of prices for airline flights. Where confusion exists in pricing structures, it may be necessary to require companies to present their prices in structured formats that allow consumers to make the choice that is best for them.

P

Priming

Inappropriate and unhealthy alcohol use is a source of significant concern in the United Kingdom. There are a number of factors that may prime people into excessive drinking. We know that people's portion sizes vary according the container size and so people who use larger glasses will tend to pour themselves

larger measures.[190] Other elements of the environment in which we drink – music, lighting, atmosphere - may also change our behaviour in relation to how much we drink and how we subsequently act: we 'go with the grain' of our environment.

A

Affect

Our general mood can affect cognitive processes and choices. If we are in a good mood we tend to make unrealistically optimistic judgements, and the opposite applies.[191] We will often make important decisions in such 'hot' or 'cold' states and the choices taken may not always be in our long-term interests. Where it can be predicted that our emotional state may affect our judgment, it may be useful to have a formal 'cooling off' period that allows us to come back and reconsider our decision at a later date. Examples include the purchase of insurance policies and agreement of personal loans. Government policies could better recognise the power of these 'hot' states and build in greater safeguards for people to ameliorate the consequences of decisions taken under their influence.

C

Commitment

1-2% of the population in many developed countries suffer from pathological gambling. For those with such problems, some casinos (particularly in North America) have offered self-exclusion programmes to limit an individual's gaming opportunities. Self-exclusion provides the opportunity for gamblers to sign an agreement to ban them from gaming venues. This agreement may hold for a limited time or even a lifetime. An evaluation of people who had signed contracts in Quebec showed many positive effects. The urge to gamble significantly reduced while the perception of control increased significantly for participants.[192]

Casinos in the United Kingdom could be encouraged (or forced) to make self-exclusion agreements more accessible to problem gamblers. In addition, there are increasing concerns about the number of people who are developing serious problems as a result of online gambling. Online casinos operating in the United Kingdom could similarly be forced to offer self-exclusion contracts. Of course, with the plethora of sites available it may be necessary to have a single agency to which individuals can sign a self-exclusion agreement.

E

Ego

In recent years, health promotion strategies have focused attention from targeting adult smokers into preventing smoking among children. There are a number of proven determinants of smoking behaviour including socioeconomic status, peer pressure, and cigarette advertising. It is well recognised that smoking, self-image and self-esteem are inextricably linked.[193] Adolescents can see smoking as a means to deal with stress and worry and there are particular problems with teenage girls whose smoking habits appear particularly resistant to change in many countries. A significant number of teenage girls think smoking makes them look experienced and sophisticated and they have concerns that if they quit that they will gain weight.[194] Targeted programmes to raise the self-esteem of specific at risk groups may be necessary to prevent the long-term consequences of continued smoking.

Case study: An 'opt-out' system for private pensions

The policy issue

As the Pensions Commission made clear, the current system of pensions is insufficient and 'will deliver increasingly inadequate and unequal results'. Not only are private pension contributions failing to rise as expected, but increasing life expectancy will create pressures that cannot be alleviated by raising the pensionable age alone.[195] There are currently around 7 million

people in the UK who are not saving enough to generate the income they are likely to want in retirement.[196]

Using defaults to change behaviour

The Commission pointed out that 'initiatives to stimulate personal pension saving have not worked', and pointed to 'the limited impact of providing better information and generic advice'.[197] Indeed, in 2003 an estimated 4.6 million employees had not joined employer-based pension seems to which they had access.[198] Strictly speaking, this failure is irrational, since joining such a scheme would bring considerable benefits to these employees.

There are many reasons for the low level of pension saving. Joining a scheme requires an active decision, but people often display inertia when confronted with such decisions. For example, many banks and credit cards tempt people to open accounts with attractive introductory offers, knowing that they will fail to move even when these offers elapse.[199] The problem is especially acute for pensions because they deal with a far-off future scenario: since people find it difficult to imagine old age, the decision to act does not seem to be a high priority and apparently can always be deferred.[200] Finally, people are more likely to defer decisions that are complex and confusing, and thus require significant mental effort – like selecting a pension scheme.

Information provision alone fails because people may not act on this information, for all the reasons given. In the words of one interviewee, 'we know we should be contributing to a pension plan, but it's never the right day to start'.[201] In such a situation, should government just compel people to save more? The Pensions Commission noted that 'while many people say they want to "have to save", many respond adversely to the idea of compulsory savings'.[202] How, then, should government take stronger action without removing freedom? The answer from behavioural economics: use people's inertia to actually *encourage* saving.

Currently, the onus is almost always on employees to make the effort to join their company's pension plan or buy a personal pension. In other words, the 'default' option when employees join a company is for them not to join. The concept adopted by the Pensions Commission was to change this default: employees would automatically join the pension plan, but still have the opportunity to opt-out if they wish. Changing the default means that inertia is now working *in favour* of savings – but preserving an opt-out means that the government avoids introducing a compulsory saving system. The reform also introduces a compulsory "matching" contribution from the employer, obliging them to contribute to an employee's pension (unless the employee opts out).

It is an attractive position that has been labelled 'libertarian paternalism'.[203] Indeed, one interviewee explained that having a simple and intuitive governing concept like 'changing the default' has helped maintain focus and momentum during the long process of implementing the Commission's findings. Nevertheless, having a compelling theory alone is rarely enough when creating policy; a crucial factor in gaining support for an opt-out default was the compelling evidence of its effects in real life.

To take one of many examples, a study assessed the changes in pension uptake when a large US corporation switched their default from active to automatic enrolment. As the graph below shows, enrolment increased significantly after the change in default.[204] Interestingly, introducing automatic enrolment also eliminated most of the previous differences in

participation due to income, sex, job tenure and race – the increase in take-up was particularly large for low and medium income workers.

The graph below shows pension participation rate by years worked in the company. For employees hired prior to automatic enrolment, participation increases with tenure. But the highest participation rates are for the employees hired under automatic enrolment.

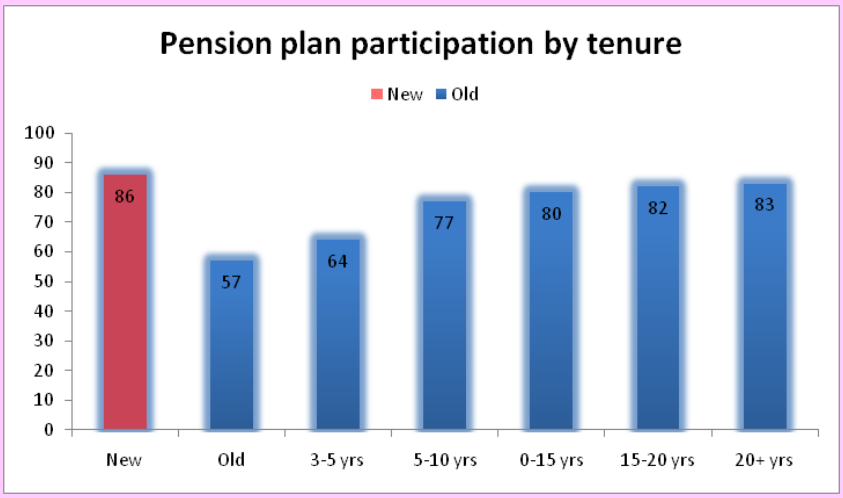

Figure 8: Change in enrolment in pension plan, by length of employment[205]

As well as sound theory and strong evidence, the movement to joining by default, with an opt-out, was aided by support from stakeholders: for example, pension providers can gain business and cut marketing costs, while small businesses' pension contributions are in line with their employees' desire to save. As a consequence, the Pensions Act 2008 requires employers to automatically enrol all eligible workers over the age of 22 into the relevant workplace pension (with minimum total contributions of 8% of salary) from 2012.[206]

Evaluation

Naturally, an evaluation of this policy does not exist as this change in the default does not come into force until 2012. Nevertheless, the practical steps of translating an interesting concept into practice are worth reflecting on. Changing default settings may be easy on a small scale and in informal contexts, but there are challenges when national governments are required to legislate:

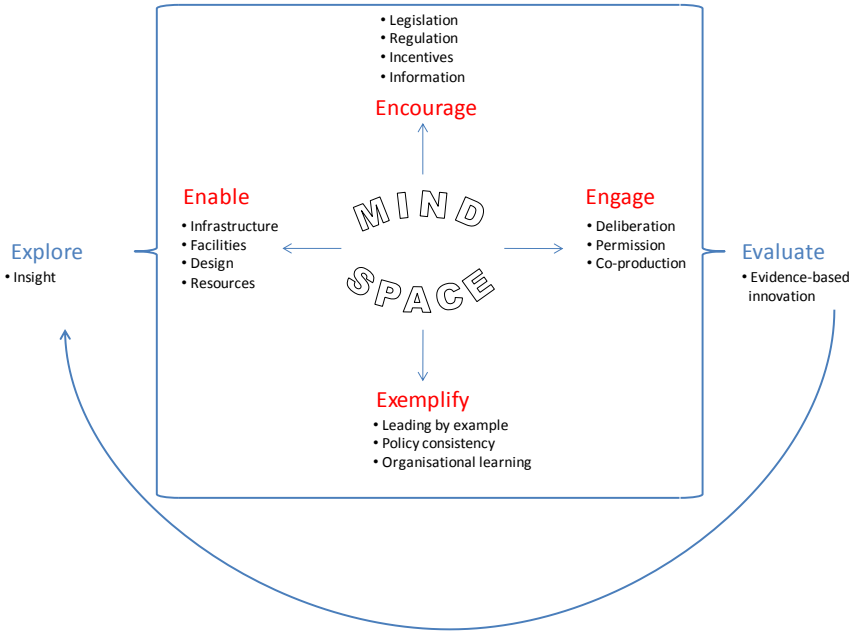
- The power of inertia means that the nature of the default pension fund needs to be chosen very carefully. As a result, the Personal Account Development Authority has just consulted on developing guidelines that will be used as investment principles for the fund managers of the proposed National Employment Savings Trust.[207]
- The use of legislation to compel employer contributions means that the Pensions Regulator will need to take on considerable new powers to ensure employers are complying with the new arrangements.
- Finally, the setup needs to reflect the motivations of the different parties. For example, the question of who provides the opt-out (i.e. who the messenger is) needs to recognise that employers may have an incentive to encourage employees to opt out.

Changing defaults is seen as a relatively cheap way of encouraging beneficial behaviours. Of course, this depends on a) costs associated with the actual change of the default; and b) the costs arising from more people

choosing the new default option. In terms of changing the default, the DWP has estimated there will be a one-off transition cost of £0.3 billion.[208]

The average monetised costs and benefits of people choosing the new default are roughly equal at approximately £15 billion a year, although they accrue to different parties (combined individual and employer contributions are offset by £15 billion of higher income for individuals in retirement). However, the DWP believes that there will be additional non-monetised benefits of £40 billion of social welfare benefit over 43 years (as a result of smoothing citizens' income over their lifetime), as well as a long-term increase in UK incomes due to additional savings.[209]

Applying MINDSPACE to policy-making



So far, we have explained MINDSPACE and shown its applications in the real world. This chapter explains how policy-makers can put MINDSPACE into practice. It focuses purely on *how* government *could* apply MINDSPACE. Of course, ministers and policy-makers also need to consider fundamental questions around whether government *should* attempt to change behaviour. We explain these normative issues in the next chapter; for simplicity and ease of exposition, we focus on practicalities first.

Traditional ways of changing behaviour, such as legislation, regulation, and incentives, can be very effective. MINDSPACE does not attempt to replace these methods. Rather, it extends and enhances them, adding new dimensions that reflect fundamental, but often neglected, influences on behaviour.

Similarly, applying MINDSPACE in practice builds on existing methods of changing behaviour. To illustrate this, we have drawn on the "4Es" policy framework, originally developed by DEFRA, which has been applied in various behaviour change strategies.[210] The 4Es are four actions that should underpin government's attempts to change behaviour: Enable, Encourage, Engage and Exemplify. We have added two supporting actions: Explore, which takes place before policies are implemented, and Evaluate, which judges the success of the policy.

In basic terms, MINDSPACE represents the tools for changing behaviour, and the 6 Es constitute the framework within which they can be applied. Bringing these considerations together into a coherent narrative will allow policy-makers to address the over-arching "so what?" question in practical ways.

The diagram below shows how the various actions fit together, but it does not intend to offer a comprehensive overview of every element of the policy-making process. Rather, it highlights areas which need extra attention, or a modified approach, in order to change behaviour effectively.

1. Explore

Understanding whose behaviour you are changing

Our behaviour is also affected by conscious understanding of our needs and desires

Any attempt to change behaviour needs to understand the behaviour it wishes to change. MINDSPACE explains the robust effects that underpin human behaviour, derived from our increasing understanding of how the Automatic System and contextual cues affect us. However, our behaviour is also affected by a more conscious and considered understanding of our needs, desires and priorities. Recognising these various influences is crucial, given the complex environment in which people make decisions.

The discipline of 'Customer Insight' generates a "deep" understanding of people's experiences, beliefs, needs or desires.[211] In order to develop a more sophisticated understanding of these factors, Insight often divides the citizens whose behaviour will be affected into different 'segments'. Naturally, there is considerable variation in attitudes towards a particular issue, and segmentation allows government to frame behaviour change to 'segments' of the population in ways they may find more appealing. For further information, please consult the recent Cabinet Office guide to segmentation.[212] Figure 9, below, gives an example of Defra's work to segment the population by willingness and ability to act in 'green' ways.

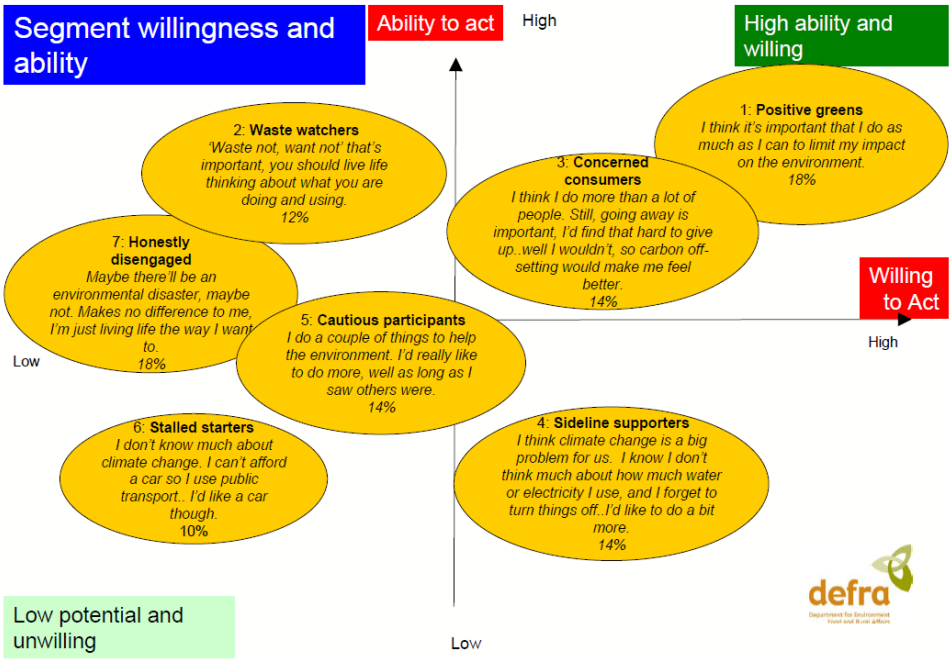


Figure 9: Example of customer segmentation[213]

Whilst there may be debate about how best to represent and segment different groups in society, Insight explicitly recognises that the 'cultural ecology of rationality' – the collective way of assessing information and making decisions – may vary between groups and communities.[214] There is also great value in listening to those working on the frontline of public services, who can provide invaluable information on how individuals tend to make decisions in complex real world situations – the hopes they harbour and the frustrations they experience.[215]

Insight helps create a more nuanced understanding of how MINDSPACE can be applied in practice

Insight therefore helps create a more nuanced understanding of how MINDSPACE can be applied in practice. The policy-maker can therefore draw on both the rich material from insight techniques and the generalisable effects of MINDSPACE. Indeed, Insight may offer useful indications about which of the MINDSPACE effects may be most appropriate for particular groups: if people express particular admiration for certain figures or roles, these may make effective messengers; if people show strong attachment to certain groups, then focusing on social norms

may be appropriate. Insight could also draw on scientific research: for example, a recent study showed that the impact of MINDSPACE effects varies greatly between men and women in the context of encouraging hand-washing.[216]

Exploring behaviour in this way requires a combination of different skills

Exploring behaviour by drawing on both MINDSPACE and Insight is not easy. Our interviewees suggested that senior policy-makers have a particularly important role to play here. Ideally, they need to have a (rare) combination of analytical capacity based on behavioural economics, imagination from strategic marketing, and awareness of social science. To ensure this combination of skills is available, it may be profitable to bring together policy-makers with communications experts and psychologists in the early stages of behaviour change initiatives.

Key questions for policy-makers

- Whose behaviour are you attempting to change?
- How do attitudes and motivations vary between the different groups concerned?
- How are you combining Insight with the MINDSPACE effects?
- Does your team have the capacity to draw on both Insight and behavioural theory?

2. Enable

Start from 'where people are'

Recognise the practical and structural barriers people face

Government needs to "enable" behaviour change by recognising the practical and structural barriers that people face. Policy-makers should remember that the context in which people find themselves shapes the options that are available to them and affects their ability to select these options. Attempts to encourage behaviour change that do not recognise these contextual factors are likely to breed frustration only.

For example, government may decide to encourage people to wash their clothes at 15°c, since this brings benefits for the environment. The purpose of the policy may be to influence people to choose 15°c rather than, say, 40°c – and using MINDSPACE may be very effective in encouraging people to do so. But the policy will have limited impact if most people's washing machines simply do not have a 15°c option. Of course, the policy's attempts to influence people may have been so powerful that people feel compelled to buy a washing machine with such an option. But suppose these washing machines are far too expensive for most people: the 15°c option effectively remains closed to them. In other words, contextual factors are preventing behaviour change, despite people's best efforts.[217] Government can help people surmount these barriers, but only if they are recognised.

The availability of choices is an important factor

Any attempt to encourage new behaviours needs to consider the wider context and choices available to people, rather than focusing narrowly on the desired behaviour. Are there underlying, compelling reasons why people will not be able to change their behaviour? What can be done about them? The effects in MINDSPACE are powerful and are likely to handle most of the "heavy lifting" in behaviour change – but the very choices that exist are an important factor in themselves.

Key questions for policy-makers

- How does the wider context in which people act constrain or encourage the change you seek?
- What are the effective choices available to different sections of society?
- How do the choices that government presents affect behaviour?

3. Encourage

Applying MINDSPACE to change behaviour

Encourage covers the policies and government actions that (directly or indirectly) try to change how people act. The 6Es diagram features the main 'traditional' attempts to influence behaviour - legislation, regulation, incentives, and information – many of which are very effective. Given that this category includes coercive measures, the label of "encourage" is used in a broad sense.

Civil servants need to better understand the behavioural dimension of their policies

As shown in the last chapter, MINDSPACE can add a lot to these policies. But that does not mean that "behaviour change" can be understood as simply a novel alternative to, say, legislation. As noted before, the majority of what government does is intended to change behaviour in some way. Rather, civil servants need to better understand the *behavioural dimension* of their policies and actions. Therefore, when policy-makers attempt to encourage certain behaviours, MINDSPACE suggests there are three approaches that can be used:

- **Enhance.** MINDSPACE can help policy-makers understand how current attempts to change behaviour could be improved. For example, incentives are currently widely used to change behaviour, and are often effective – but MINDSPACE shows how their impact could be enhanced by a better understanding of how people respond. Similarly, the impact of information can be improved by considering salience effects. The logic here is that if the state is already attempting to change behaviour, it should do so as effectively as possible.
- **Introduce.** Some of the elements in MINDSPACE are not used extensively by policy-makers, yet may have a considerable impact. Most notably, there is room for more innovative use of social norms and commitment devices in policies. Of course, introducing new measures in this way may require significant efforts to ensure there is public permission for the approach.
- **Reassess.** Government needs to understand the ways it may be changing the behaviour of citizens unintentionally. We have already seen that some priming effects work in surprising ways that seem hard to explain. It is quite possible that the state is producing unintended – and possibly unwanted – changes in behaviour. The insights from MINDSPACE offer a rigorous way of reassessing whether and how government is shaping the behaviour of its citizens. There is a further issue here around permission. If government is changing behaviour unintentionally, then it is not seeking permission to do so. Therefore, reassessing the government's role may increase democratic accountability.

The factors in MINDSPACE invite these three approaches to varying degrees.

- **Incentives** and **Salience**, for example, are existing tools to change behaviour that could be enhanced.

- **Messenger** and **Defaults** involve a greater degree of reassessment: they are currently being used to change behaviour, but with less consideration and intent.
- **Priming** may not be used intentionally very much (if at all), but its possible introduction into policy is still rather unclear and controversial.
- **Norms** are a more obvious candidate for introduction, but it's still important to understand how government may be unintentionally influencing them.
- **Commitments** are used to a limited extent, but could be introduced further. Their use by government is generally intentional, and so they do not invite much reassessment.

It is not *just* choices that affect behaviour

The key point is that government is always shaping behaviour. Often (as in *Nudge*) this is framed in terms of the *choices* government offers. However, MINDSPACE shows that it is not *just* choices that affect behaviour: a whole range of factors in the environment affect behaviour without any "choices" taking place. For example, a hospital may launch a policy to reduce violence against staff that focuses on changing the interactions between staff and visitors: perhaps using social norms to point out that most people behave politely, or relying on ego effects to draw on people's desired positive self images. But the design of the built environment of the hospital may have shaped behaviour so that people are stressed and prone to violence before these interactions take place.

Part of this stress can be understood in terms of choices offered – for example, the possible routes through a building – but it may also be created through factors such as the clarity of the signs (salience) or the cleanliness of the floors (affect). Indeed, Birmingham Heartlands hospital redesigned its Accident and Emergency department with the aim of reducing environmental triggers for crime. After analysing how people used the building, new signage was introduced and natural surveillance was extended; as a result, the average number of aggressive incidents fell from 13 a month in 2003 to 5 a month in 2005.[218]

Key questions for policy-makers

- Can you introduce any new elements from the MINDSPACE framework?
- How does MINDSPACE enhance your existing attempts to change behaviour?
- Do you need to reassess your existing actions using MINDSPACE?

4. Engage

Facilitating public debate and gaining approval

New methods of engaging the public may be needed to explore what is acceptable

Behaviour change can be controversial, involve difficult tradeoffs, and concern areas where government legitimacy is controversial. These questions are both tricky and of general concern to the public. Therefore, new methods of engaging the public may be needed to explore what actions are acceptable. COI have recently published a guide to *Effective public engagement* that offers helpful guidance in this area.[219] The question of gaining *approval* raises difficult questions about how far elected representatives should seek specific permissions for their actions. This is a much wider debate, but we argue that the potentially controversial nature of behaviour change initiatives means gaining specific approval is important.

A deliberative format may be most suitable

Given that there are still many unresolved questions around behaviour change, a deliberative format may be most suitable. Focus groups have often been used for similar purposes, but have the disadvantage of being small-scale as well as private – and therefore may not be seen as being able to give legitimate approval for a policy. Citizens' juries are more transparent and attract relatively high trust: while only a third of people say that they would trust a local group of councillors to resolve a difficult planning issue, two thirds say they would trust a decision made by twelve members of the public.[220] But juries are still small samples and are vulnerable to domination by a few individuals. Both focus groups and juries may have considerable value in giving policy-makers a new perspective on issues, but they may only partially address the issue of giving 'permission' for a major behaviour change policy.

A policy-maker looking to gain permission for a policy may wish to turn to larger-scale, public events. These often involve a representative sample of several hundred people being brought together for a day or more to listen to evidence and discuss an issue. In 'deliberative polling', participants are polled on their views at the beginning and end of the process, and a shift in attitudes is often seen. In 'deliberative forums' people often asked to reach a collective view, which can create more need for discussion and negotiation.

National Pensions Day

On 18th March 2006, 1,075 people, across six locations, took part in National Pensions Day. Participants were selected to represent various sections of the population. In demographically mixed groups of 10, they had detailed discussions on the Pension Commission's proposals, and voted using key pads. People also took part in online debates. 72% of participants voted in favour of automatic enrolment with the choice to opt-out (the adopted policy), and 20% for full compulsion with no opt-out.[221]

Such events may have greater legitimacy than focus groups because they can offer a more representative sample of the public, which means they give the impression that the nation has had a "fair say" and no section of society has been excluded.[222] Of course, policy-makers have to decide who the sample is representative *of*: should it be the nation as a whole, or just those groups whose behaviour will be affected? Much depends on how the opportunity costs of intervention are framed, but they may decide that the most acceptable solution is to have a cross section of relevant target audiences.

Such events may preserve personal responsibility

If the event has such legitimacy, then it could be seen that some personal responsibility has been preserved because people have been able to make a considered and informed decision to allow government to change their behaviour. Of course, these types of events are only likely to succeed if they are seen to have consequences, rather than being "for show" only. There is potential for government procedures to demand that policymakers explain how they have taken results of such an event into account – even if they do not act on them.[223]

There are ways of reducing costs

Although these events may seem expensive, they should be compared against the total cost of government consultation – and there are some ways of minimising their costs. For example, government could hold regular high-profile deliberative forums (perhaps once every two months), with a refreshed sample of the public, that departments would bid to use.[224] In practice, the range of behavioural issues in policy is so large that government will not always be able to gain permission in this way. Therefore, the most sensible approach for policy-makers is to anticipate which policies are likely to be most controversial, and try to match the level of engagement accordingly. We suggest how public acceptability can be anticipated on page 64.

Key questions for policy-makers

- Are you seeking permission for a policy or new perspectives on a behaviour change issue?
- Are the consequences of your policy so wide-reaching or so potentially controversial that a deliberative forum or poll may be needed?
- If so, how are you going to take the results of the event into account?

5. Exemplify

Changing government's behaviour

The actions of government representatives send messages about the behaviour it condones

In most behaviour change interventions, exemplifying desired changes is important for two main reasons. First, because the actions of high-profile representatives of government send implicit messages about behaviours it condones. If government is not displaying the behaviours it is encouraging in others, this will act against people's desire for reciprocity and fairness (see 'Commitment'), while inviting charges of hypocrisy. Second, government policy should not give mixed messages about whether certain types of behaviour are encouraged or not. Just as individuals seek consistency (as shown in Ego effects), there needs to be consistency in the behaviour of government and its representatives.

MINDSPACE principles can be applied to the process of policy-making

MINDSPACE suggests a third dimension: its principles can be applied to improve the process of policy-making. In other words, government attempts to change its own behaviour. Are there instances where the status quo bias has led to the default being adopted? Does the status of the messenger sometimes outweigh the strength of the message? Do loss aversion and mental accounting prevent innovative reallocation of budgets?[225] This is particularly resonant in the current economic climate and the state of the public finances. Many public policy decisions may simply reflect how things have always been done, and the potential losses from moving away from this position may loom large, relative to the gains. Policy-makers may overcome this inertia by framing the decision differently - for example, by starting from the perspective of the alternative state of the world.

MINDSPACE could be applied to organisational change in government

Furthermore, MINDSPACE could be applied to the process of achieving organisational change in government. There are some obvious 'easy wins' here, such as lowering the default temperature in buildings to meet SOGE emissions targets, or using Ego effects to lift employee engagement. But there are also more fundamental applications. For example, incentives have been applied to encourage cross-departmental working, with mixed success so far.[226] Better appreciation of the MINDSPACE effects, particularly the behavioural response to incentives and the power of creating a collective social norm, may help government make greater progress towards meeting this challenge. This is an area the Institute for Government will be exploring further.

Key questions for policy-makers

- Are the actions and policies of government consistent with the change you are seeking?
- How could MINDSPACE be applied to improve the way you and your team make policy?
- How could MINDSPACE be used to help achieve organisational change in government?

6. Evaluate

Working out what works

It can be unclear how various effects with interact in specific cases

Any attempt to change behaviour must recognise the challenge it faces. Some of the factors that influence behaviour are fairly obvious and easy for government to influence; others are more elusive and require tradeoffs. And while the evidence for the effects in MINDSPACE is very strong, it can be unclear how the various effects will interact in specific cases. Behaviour change policy needs to understand the complex range of factors that affect behaviour, and good evaluation is a crucial way of doing so.

We should aim for evidence-based innovation

We know that some things work in some contexts but can they be translated across contexts? Although there will always be a healthy tension between evidence-based policy and innovation-based policy, our collective mission should be evidence-based innovation. In other words, we should take what we know to be robust phenomena across a range of contexts and give them the best shot of success where the evidence base does not exist. Considering the various elements of MINDSPACE will be central in this regard.

The main challenges to determining 'what works' are controlling for selection and establishing causality. We suspect that commitments work, for example, but only in those who chose to sign up to commitment devices.

There are four main approaches to demonstrating causality

There are four main approaches to demonstrating causality. These can be pictured as lying on a spectrum: at one end, there is the case of the researcher having no control over the data; at the other end, there is the case of the researcher having total control.

No control

1. Secondary data, inferring causality
2. Secondary data, natural experiment
3. Primary data, field experiment
4. Primary data, laboratory experiment

Total control

There are clearly pros and cons with all these methods. Data we have no control over are more 'real world'; data we can control are less like the real world. To establish causality, we must take full advantage of all the data and methods available to us. We should continue to look for secondary data that can be used as natural experiments – but the lack of suitable data does limit how far this approach can take us. Much more can be done with field experiments, which have been under-used in research into behaviour change but, with innovative designs and the right research partners, have the potential to shed some significant light on the underlying causes of changes in behaviour.

There should be greater collaboration between policy-makers and academics

Whatever the precise details of the studies, there should be greater collaboration between policy-makers and academics. There has been enormous progress at the two ends of the control spectrum (analysis of secondary data and lab experiments) and the time is ripe to enhance the evidence base by taking some control of the data in a real world environment.

The same rigour that is used to evaluate the effectiveness and cost-effectiveness of health technologies and, increasingly, public health interventions must be applied to behaviour change interventions. Therefore, there is a good case for establishing an institutional centre that can evaluate behaviour change. This does

not need to be a new body, but it does need scientific competence and a degree of independence. The centre would be tasked with determining which methods were most effective and cost-effective for changing specific behaviours.[227]

Of course, evaluation may allow us to develop a better understanding of which groups in society may respond best to which interventions. This knowledge will then feed back into the initial process of exploring how to change behaviour through Insight, segmentation, and the best robust evidence available.

Evaluation in practice: Camden council

Camden Council is currently evaluating the use of heat meters to change energy use. In 2008, the council installed new radiator-based heating systems in 150 houses in Gospel Oak. These new systems are popular with residents, since they now have much more control over their heating. In addition, the new systems incorporate heat meters that measure the hot water used by a property. The heat meters can provide accurate data on carbon emissions (whereas information on energy consumption is often self-reported and thus open to distortion).

Upgrading the heating systems has therefore had the side-effect of creating an accurate and representative set of data for an important policy issue. Indeed, the heat meters have now produced a full year of data, thereby establishing a baseline for evaluation. Furthermore, the fact that every house on the estate has a meter eliminates the 'selection bias' that is created by relying on volunteers (since volunteers are likely to be environmentally-conscious anyway and thus not be typical energy users)

Camden has now received funding from Mayor's Targeted Funding Stream to extend the heat meters scheme to 2,500 homes across the borough. This larger sample will present an excellent opportunity to evaluate attempts to change energy usage through: a) judging the impact of particular behaviour change effects relating to elements of MINDSPACE, b) examining how results vary according to residents' characteristics, and c) studying how impact varies over the longer term. For example, the power of social norms could be tested by examining if allowing residents to compare their energy consumption against the surrounding average affects their usage. To minimise costs, this information can be provided on LCD displays on the heat meters themselves.

A similar approach could be used to measure the impact of using pledges to take energy-saving measures (commitment); how the use of emotion affects usage (affect); and the best way to frame incentives, as well as their cost effectiveness (incentives). Not only does this mean that, for example, the impact of commitment devices can be tested robustly, but it can also be compared against the impact of social norms. In this way, policy-makers can build up an understanding of what are the most effective ways of changing behaviour in a particular setting.

The actions listed above are suggestions only and have not been adopted by Camden. However, the council has planned well for its evaluation by gathering expert academic input early on in the process. Collaboration of this kind will bring benefits for both sides. Camden will be able to underpin their actions with academic rigour, in order to understand where they can get most value for money. On the academic side, this promises to be a high-quality field experiment that will advance our understanding of behaviour change as a whole. Despite these mutual benefits, the link was only made through the enterprise of individuals. This suggests there is a significant role for

Intermediaries who can reconcile the desires and priorities of policy-makers and academics, who can see the opportunities for mutual gain, and who know the best people to contact in the various fields.

Looking at the example of Camden, there are some lessons for building evaluation into policies aimed at behaviour change:

1. Ensure you are actually measuring what you intend to measure robustly. Heat represents 80% of a property's carbon emissions, whereas meters that track electricity usage only cover 11% of emissions.

2. Personal relationships and institutional outlook are important. Camden was open to working with academics, while academics understood the policy context and contingencies.

3. Policy-makers should understand what they can gain from evaluation. In a time of fiscal constraint, robust knowledge about the (cost) effectiveness of policies is particularly valuable. If evaluation is built in early, any disruptions to implementation can be minimised.

Key questions for policy-makers

- How will you evaluate the results of your intervention?
- What measures will you put in place to ensure this evaluation is robust enough to provide convincing evidence?
- Is there an opportunity to get academic collaboration?

Making policy differently: an example of MINDSPACE in practice

How can policy-makers apply this framework in practice? Below we explain how it can all come together, step by step. We apply the framework to the fictional example of a local authority attempting to change behaviour around short car journeys. This example has been chosen because it gives a particularly clear example of how the Es can be applied, rather than because it is likely to be the most effective on its own terms. In Annex 2, we show how the framework could tackle teenage pregnancy.

The policy issue

A local authority is trying to reduce its LAA commitment to reduce CO2 emissions in the area. It has identified reducing the high volume of short car journeys as a key objective, since research suggests people could replace 78% of car journeys under five miles with a different mode of transport.[228] Of course, they realise that doing so will require considerable changes in behaviour. Owing to the short timeframe of the LAA commitment, they decide to focus first on those journeys that are likely to be easiest to change quickly. How does MINDSPACE help them do this?

Explore

The local authority starts by trying to understand people's conscious motivations and reasons for their current behaviour. The local authority uses the Department

for Transport's National Travel Survey, which identifies four main reasons for trips: commuting/business, social, shopping and 'escort' travel (accompanying others, such as children to school).[229]

A short insight exercise helps the local authority explore local residents' thoughts about these types of trips. They discover that commuting and 'escort' travel are difficult to change quickly because they often heavily ingrained habits that take place under 'cognitive load' (in other words, in the morning we are under pressure and just want get to work – or our children to school). Therefore, they initially choose to focus on shopping behaviour. Insight suggests that the main car use for shopping consists of a weekly supermarket visit and various trips to more local shops.

The local authority also explores residents' attitudes to changing their behaviour. The purpose here is to see what MINDSPACE effects may be most appropriate – for example, whether there is potential to participate in activities that require more conscious support (for example, commitments). It learns that most people are vaguely aware that the environment is an issue (mainly because of media coverage), but it is not salient to them. As a result, there is a gap between attitudes and behaviour. They are, however, very concerned about financial stability and wish to save money. Finally, they strongly associate, often unknowingly, the act of using a car with a positive self-image of capability and freedom.

These motivations and attitudes suggest some potential applications of MINDSPACE:

a) Salience may be important for re-framing the familiar act of taking a short car journey
b) Incentives may be useful to take advantage of people's desires to save money
c) Commitment or Ego devices may work by drawing on people's impressions of themselves as 'good citizens', to counteract their positive associations with cars
d) Priming may be effective, since there are some clear locations where primes could be deployed

There are also some MINDSPACE effects that may be less effective:

a) There is no obvious way of setting a Default in the choice architecture
b) There are few obvious ways of using Messengers that most people may pay attention to for this behaviour
c) These short car journeys are the dominant Social Norm in the local area, which makes the exploitation of norms more problematic – but not impossible

Enable

The local authority realised that it would be unhelpful to encourage behaviour that was constrained by many substantive barriers. They looked at the practicalities of using alternatives to cars for these journeys, including cost, infrastructure and transport provision. Cost was not seen as a barrier, since the alternatives to car journeys were usually cheaper; infrastructure presented some problems, since one of the major supermarkets had limited pavement access; bus services were plausible alternatives for most of the target population, with all three of the supermarkets having a bus stop within two hundred metres.

Encourage

The local authority decided to draw on Salience, Priming and Commitment, as follows:

Salience and Incentives

In order to play on residents' desire to save money, the local authority distributed a series of mock coupons offering "£3 off your next shop", explaining that this is the average cost of a return car journey to the shops or supermarkets in the local area (including parking charges). This has the effect of framing car journeys in terms of their cost, which is salient to residents; it also takes advantage of mental accounting, since it attaches the cost to a specific account – if a trip is simply to buy a £4 takeaway, £3 will seem large in this 'mental account'. This message was also backed up by a limited advertising campaign in main town centres.

Commitment and Ego

In order to counter positive self-images of using a car, the local authority wanted to tap into alternate sources of positive self-image: the desire to be a responsible citizen. Commitment devices were used in order to encourage people to be consistent with this self-image. People were asked to commit to not using their car on a Sunday with two other neighbours, perhaps with the forfeit of washing the neighbours' cars. It is likely that people will have a powerful motivation to present a positive public image, while the involvement of two other neighbours means there is low-key enforcement. Finally, the local authority concentrated on gaining many commitments from selected streets (rather than spreading the commitments across street), in order to create a dominant and visible social norm. The local authority also said it would come back every other month to see if the challenge had been met. If this policy was successful, this could be extended to a more challenging 'Car Free Saturday'.

Priming

Before and after the initial campaign, the local authority ran a survey at supermarket entrances and town centres, asking local residents about the number of short car journeys they took a week. Not only did this provide valuable data, it also 'primed' people to be more receptive to the messages. Finally, the local authority also agreed with the main supermarkets to put a large sign saying 'WALK IN' at their entrances: although this appeared to be an invitation to enter, it was intended to associate supermarket visits with the act of walking.

Finally, the local authority also reassessed its current communications about car journeys. It realised that its current tactic of warning people that widespread car journeys were polluting the local area may have be reinforcing a negative social norm, since it was highlighting how normal such behaviour was.

Engage

There was relatively little need for engagement in this instance:

- Most people accepted the goal of the behaviour change: they recognised that they should be using their cars less, on the grounds that it will bring benefits for others; and, to a lesser extent, health benefits for themselves
- Although the use of priming is generally controversial, it was less so in this instance because most people are familiar with the practice of being asked survey questions. The 'Walk In' signs were also less controversial because most people accept some degree of influence over their behaviour in commercial environments.

However, the local authority recognised that the commitment devices could be seen as neighbours 'snooping' on other neighbours. Therefore, they stressed the voluntary nature of the commitment and framed it more as a light-hearted challenge to strengthen relations between neighbours.

Exemplify

The local authority also recognised the importance of being seen to 'practise what it preached'. Of course, many of the relevant images of government behaviour (such as the use of ministerial cars) are out of local government control, while the everyday activities of local government may not be salient to residents. Nevertheless, the council ensured that it minimised the short car journeys of employees by organising car pool activities and providing adequate bicycle racks. It also used incentives through a lottery that randomly attached a £10 high street voucher under the saddle of one employee bicycle every month. The Leader's status as a messenger was exploited by publicising his achievement in going an entire week without using his car.

Finally, the local authority considered whether its own policy-making approach to short car journeys could be improved. It decided to change practices so that the mental default in road planning was to consider the possibility of non-car journeys first, to ensure all options and perspectives had been registered. The council also made a public commitment that future retail planning decisions must ensure there is adequate provision of accessibility for non-car users.

Evaluate

The council evaluated the intervention through two main methods: surveys and selected follow-ups. Before the intervention started, the council conducted a day-long survey on a Sunday at the three supermarkets and town centre. The survey asked: a) if the person had travelled by car to get there; b) if so, approximately how far; c) how many short car journeys they took each week. This survey was then repeated a month after the initial campaign had been in force, and again three months after that. The surveys also acted as priming mechanisms for the main campaign.

The follow-ups were for the commitment campaigns. As promised, the council followed up a random sample of those who had committed to not use their cars to determine if the commitment had been held. The council would check with at least two members of each commitment group, to reduce self-reporting bias. They also asked those who had been offered to participate but had declined, to see how their car use had changed. Likely CO_2 savings could then be calculated from these estimates.

Who should act?

We have outlined how MINDSPACE could be applied in practice through Exploring, Enabling, Encouraging, Engaging, Exemplifying and Evaluating. But an obvious question follows on from such a guide: *who* should be undertaking these actions? Are these mainly tasks for central or local government?

Of course, policies aimed at shaping behaviour often act at different levels, with local actions complementing national campaigns. The division of labour will be affected by the obvious fact that certain policy responsibilities reside with different tiers of government. But there are at least three other factors to consider:

- **Scale.** Certain effects may rely on a level of co-ordination that requires national government involvement. For example, norms may be more quickly established through national media because it can supply greater consistency of message.
- **Feedback.** It has been shown that if people receive some feedback from changing their behaviour it can encourage that behaviour further. Feedback may not need government involvement, just as people may thank you if you start offering them your seat on the train. However, local

government may be well-placed to provide feedback on behaviour change in ways that are salient, perhaps by relating it to familiar local events and locations.[230]

- **Points of contact.** As well as high-level campaigns, there is a role for the organisation charged with contacting the citizen to frame and shape the contact using MINDSPACE. This could be, for example, a letter from the DVLA or a visit from a social worker. People working at a local level (though not necessarily in local government) therefore have a significant role to play. This is particularly true because they may be better informed about the recipient's context, which may help them apply MINDSPACE in an effective way.

Local government may have a particular role in engaging citizens

Local government may have a particular role in engaging citizens. The rationale here is that local government is 'local enough to engage directly in dialogue with communities about the balance of values that 'authorises' any intervention.'[231]

Similarly, local government is well-placed to 'Enable' certain behaviours by identifying and removing practical barriers. By understanding the overall context in which people act, local government may be able to see that, for example, opportunities for exercise are limited by poor access to a park or recycling by the location of deposit banks. This may lead to opportunities for co-production that help local government better direct its resources to encourage certain behaviours – or to apply for funding to address outstanding barriers.

Finally, local government is likely to be presented with more opportunities to pilot and evaluate innovative ways of changing behaviour, as in Camden. In this instance, central government may have a role in holding a fund for piloting or evaluation, and in providing guidance. The London Collaborative has recently produced a guide for those wishing to identify specific roles that local government can play in behaviour change.[232]

Public permission and personal responsibility

This chapter considers issues around the legitimacy of government involvement in behaviour change. First, we offer the different reasons why behaviour change may spark controversy. Second, we outline public perceptions of personal responsibility and explain how MINDSPACE may change the terms of the debate.

Potential for controversy

Citizens' views need to be taken into account

Policy-makers know that attempts to change citizens' behaviour may well be controversial. This is particularly true given new evidence about how people act, and new ways of applying this evidence. Government legitimacy rests on the fact it represents and serves the people, and thus it is vital that their views are taken into account when considering any attempt to influence their behaviour.

Framing is crucial when attempting to engage the public with behaviour change. As Gillian Norton has pointed out, 'talking about behaviour change is a sure fire way of making sure it doesn't happen'.[233] Across government, many of our interviewees have argued that "behaviour change" is an unhelpful term. "Behaviour", in particular, has negative and paternalistic associations.

Public acceptability should not be the sole criterion for action

Of course, there are good reasons why public acceptability should not be the sole or determining condition for going forward with behaviour change. We explore some of these issues in a later section on personal responsibility, while Richard Reeves has recently proposed tests of legitimacy, autonomy and effectiveness for health-related behaviour change.[234] Furthermore, it may be that government needs to take a lead on issues despite public opposition, since these public attitudes may actually shift in response to the introduction of the policy. Consider, for example, the shift in attitudes to the London congestion charge (see Figure 10, below).

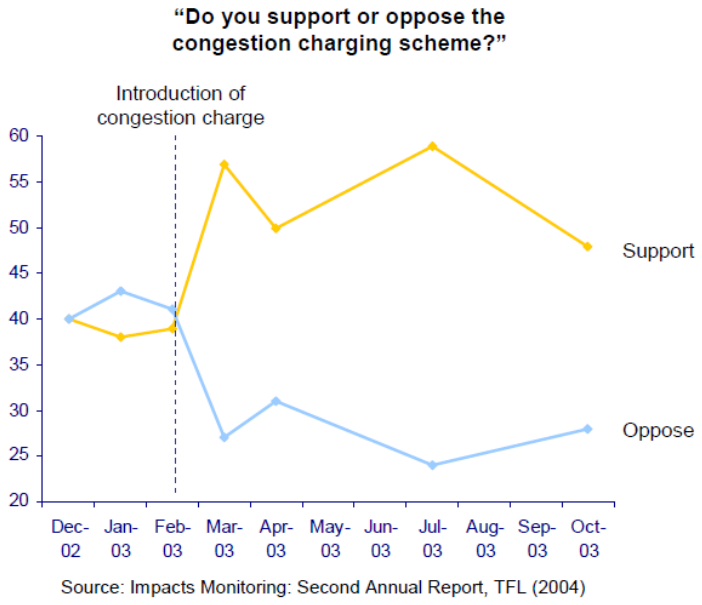

Figure 10: Support for the London congestion charge, 2002-3[235]

How preferences change in response to policies is a remarkably under-researched area. Economists, for example, typically focus on people's preferences before a change and rarely go back afterwards to see how things actually panned out. How, then, can policy-makers decide which policies have the greatest potential for controversy, and thus may require extra efforts to engage citizens?

Naturally, there are some criteria that determine the acceptability of policies in general, including cost, benefits (and their distribution), and the number of people affected. All these factors may put extra pressure on the state of the evidence – whether there are robust reasons to believe the policy will succeed.

In addition to these general criteria, there are three factors that are particularly useful for understanding controversy around behaviour change:

Three factors for understanding controversy

1. *who* the policy affects
2. *what* type of behaviour is intended
3. *how* the change will be accomplished

We show how policy-makers can apply each of these criteria to estimate the potential controversy that may ensure from a proposed policy. We then show how the framework could be applied to a hypothetical policy.

1. Who

We generally accept greater government intervention for some groups

We generally accept that government has greater scope for changing the behaviour of some citizens more than others. Children, the mentally ill and (more controversially) those suffering from addictions are usually seen as not wholly capable of making effective decisions about their own welfare. Paradoxically, though, attempting to change the behaviour of these groups may be controversial precisely because they lack autonomy – government is in a position of considerable power, and so other citizens are likely to scrutinize its actions carefully. One element of this controversy concerns whether these groups are capable of fully understanding the behaviour change, and thus whether they can give meaningful approval to what is being done.

Changes affecting particular groups will require careful justification

Any behaviour change that will affect certain groups in particular is likely to require careful justification, not least to any associations that represent those groups. But there may be particular controversy if the behaviour concerned is seen as integral to a group's identity or culture.[236] There may be good reasons for the change, but policy-makers need to be aware of the potential charges of discrimination and intolerance.

Receipt of government help is often seen to justify requests to change behaviour

We have seen that people have a strong instinct for reciprocity. Accordingly, recent political discourse has emphasised the principle of 'something for something': those who have received certain benefits from state action should act in certain ways, which may require changes in behaviour.[237] However, when government acts on this principle it may give rise to controversy – suppose, for example, the required behaviour change is seen to outweigh the benefits received. Similarly, people may feel that changing behaviour is a matter of *personal* responsibility, rather than a matter for government (we discuss this more below).

A more extreme version of this perspective is that some people, by their actions, may have forfeited some level of control over their behaviour. Most obviously, those convicted of crimes are expected to receive some punishment that affects their behaviour. But applying this principle more widely would be very controversial: it would involve creating a class of actions that function like criminal acts. Drawing these lines would be difficult and potentially harmful, although people themselves often think this way (categorising certain people as "bad parents", for example).[238]

Finally, policy-makers trying to change the behaviour of institutions face a complex challenge. On the one hand, there is a good case that the freedoms of people, rather than institutions, count the most – and government can change the behaviour of companies in ways it could not for private citizens.[239] On the other hand, there is a strong impulse for government to encourage economic prosperity and enterprise, a case which is made forcibly by business associations. Of course, many of these issues are now addressed at a European level.[240]

2. What

Assessing how much legitimacy the state has in changing certain types of behaviour is a massive and complex area. And public reactions may not be predictable or consistent: an apparently innocuous attempt to change behaviour, backed by strong evidence, may become a flashpoint. We give a few points that have practical applications.

Harms and benefits to self and others. Our case studies were chosen to reflect the distinctions that the public and policy-makers may draw between behaviour that affects others and ourselves, and between harms and benefits. These are the obvious dimensions for understanding how people react to certain policy areas. On this basis, there has been more support for interventions to promote safer communities (reducing harm to others) than to encourage healthier lifestyles (especially if framed as promoting benefits to self).

Not all types of harm are weighed equally

But not all types of harm are seen as equally pressing cases for changing personal behaviour. Harm may consist of: specific identifiable harm to others, such as anti-social behaviour or smoking; excessive calls on public resources, such as repeated irresponsible behaviour; harm to 'general others' within state boundaries, such as littering; or to 'future others', such as excessive depletion of natural resources.[241] While there is strong support for behaviour to change to prevent specific harm to others, this often falls off as the consequences become more distant from the individual making the sacrifice.

And not all dimensions of harm and benefit will be seen as equally important. Gang violence and knife crime, for example, not only result in harm to others, they result in harm that affects others in particular ways – the violation of rights, increased fear, bodily harm, and so on. In contrast, littering, which also involves harms to others, does not affect the wellbeing of other people in quite the same fundamental ways.

Is self-harm really present?

Finally, when actions affect individuals, we need to consider whether *self-harm* is really present. A key challenge is to identify when 'bad behaviours' as defined by policymakers really do reduce people's wellbeing – for example, people often really enjoy fatty foods and consumption of alcohol.[242] If we can establish that the behaviours *do* reduce wellbeing, the case for nudges is compelling; if not, the nudges (in the absence of important spill-over effects) are paternalistic, and will therefore require greater justification.

We are more likely to act if we are given a clear reason for doing so

Clarity and apparent importance of goal. If people see the harm as distant from themselves, one response is to make these harms more salient. We are more likely to act if we are given a reason for doing so that we can understand (although, as we have seen, we do not always act on good reasons). Indeed, the Automatic System means that the very act of giving explanations – regardless of their strength – increases people's willingness to agree to requests.[243]

In other words, making the desired behaviour change salient and justified can balance out people's tendency to care less about "distant" harms.[244] A 2007 MORI survey found that 70% of respondents agreed (27% 'strongly') that 'the government should take the lead in combating climate change, even if it means using the law to

change people's behaviour'.[245] All this underscores the fact that the way in which interventions are framed has an effect on their acceptability.

Conclusive evidence can provide powerful justification for behaviour

Availability and prestige of evidence and expertise. Conclusive evidence can provide powerful justification for behaviour. Focus groups for a recent study revealed that 'the level of intervention and the degree of proactive government intervention were accepted in proportion to the extent to which [participants] believed there was *evidence of harm from the behaviour in question*'.[246] Similarly, a recent study found that we accept our decisions may be impaired when there are trusted experts to advise people in making choices about their behaviour (e.g. GPs).[247] Of course, this varies between policy issues, since public trust in professions varies considerably.[248] But expertise may carry particular weight – and people may particularly welcome guidance – in those areas where they recognise that decisions are difficult or they do not have a good sense of their preferences.[249]

Government can act as surrogate willpower...

Assumption of "real" intentions. Not only does behavioural economics reveal that we are not rational, it also notes that we recognise this fact ourselves. We know that we aren't good at resisting temptation, and this can cause guilt and anxiety. In these cases, behaviour change can be seen 'to augment individual freedom, helping us do what we want to but can't do, rather than constrain it'.[250] In this way, government acts as surrogate willpower and locks our biscuit tins (we discuss the implications for personal responsibility in the next section).

...but our 'real' intentions are not always clear

This argument works well for some cases, such as pensions reform, where there was both a clear objective case that behaviour change would increase personal benefit, and widespread public recognition that people were not acting in their best interests. Where the state is just helping us act on existing intentions, there is likely to be less controversy. But what about the many cases where our intentions are unformed, conflicted, mutable, and vary in intensity? Philosophy gives us ways to analyse such intentions,[251] but policymakers may need to use new methods of engaging people to discover and inform their intentions (see 'Engage', above).

If intentions are unclear, there is a temptation that government will assume what citizens' "real" intentions are; and this is something that many thinkers and citizens find unpalatable.[252] Most people agree that government should preserve people's "right to be wrong" (depending on the harms to others); being able to identify what it would be rational for a person to do does not necessarily allow you to interfere with that person's irrational action.[253] Of course, the question is what constitutes "interfering", which leads onto the final dimension: *how* behaviour is changed.

3. How

Even if people agree with the behaviour goal, they may object to the means of accomplishing it. The different MINDSPACE effects will attract different levels of controversy.[254] There are several factors that determine controversy:

Automatic effects may raise charges of manipulation

Degree of conscious control. As noted, MINDSPACE effects depend at least partly on the Automatic System. This means that citizens may not fully realise that their behaviour is being changed – or, at least, how it is being changed. Clearly, this opens government up to charges of manipulation. People tend to think that attempts to change their behaviour will be effective if they are simply provided information in an "above board" way - people have a strong dislike of being "tricked". This dislike has a psychological grounding, but fundamentally it is an issue of trust in government.

A lack of conscious control also has implications for consent and freedom of choice. First, it creates a greater need for citizens to approve the use of the behaviour change – perhaps using new forms of democratic engagement. Second, if the effect operates automatically, it may offer little opportunity for citizens to opt-

out or choose otherwise; the concept of "choice architecture" is less use here. Any action that may reduce the "right to be wrong" will be very controversial.

Of course, some traditional attempts to change behaviour are not *explicit* (as noted in the 'Salience' section, some incentives are effectively invisible), and these have attracted controversy. But they rarely attract the charge of 'manipulation' because they are based on conscious actions to supply and register information, rather than relying on unconscious reactions.

People may feel government is affecting their personality

Impact on personal identity. People have a strong instinct for reciprocity that informs their relationship with government – they pay taxes and the government provides services in return.[255] This transactional model remains intact if government legislates and provides advice to inform behaviour. But if government is seen as using powerful, pre-conscious effects to subtly change behaviour, people may feel the relationship has changed: now the state is affecting "them" – their very personality.[256]

Familiarity may increase accepability

Familiarity. People are likely to be less suspicious of effects if they are already familiar with them – for example, most people are acquainted with the principle of a default setting. But even the less familiar effects, such as priming, may be present in everyday life. For example, simply asking people how likely they are to perform a task in the future increases the likelihood that they will, yet it is a fairly common action and so people are more likely to see it as innocuous.[257] As always, framing is crucial.

Is the effect easy to explain?

Ease of understanding. Closely related to familiarity is whether the effect can be easily understood if explained. For example, most people can grasp the idea that certain actors are more persuasive than others (messenger). On the other hand, the workings of social norms and (especially) priming are complex, difficult and often counter-intuitive.

Does the effect violate a sense of fairness?

Perceived fairness. Effects may be controversial if they have a particular impact on certain members of society – clearly, this relates to the question of "Who" is affected. But the nature of the effects themselves may be seen as unfair: financial incentives to reduce harms are controversial because they are seen as rewarding bad behaviour.[258]

Judging potential acceptability in practice

Policy-makers can apply the criteria of 'Who, What, and How' to predict whether certain behaviour changes are likely to be controversial. To give a simple and hypothetical example, consider how Acceptable Behaviour Contracts (ABCs) as currently in use could be made less acceptable by changing each one of the three factors.

- **Who.** ABCs were originally introduced for 10 to 17 year olds. We generally are more tolerant of changing children's behaviour because they may not be fully aware of their roles and responsibilities in society. ABCs are increasingly applied to adults, and there are grounds for this being more controversial. In the event, the move has attracted little controversy because the harms of anti-social behaviour are seen as the same regardless of who causes them. But consider the controversy if ABCs had targeted particular groups of adults: *Single Parent* Acceptable Behaviour Contracts, for example.
- **What.** Suppose these adult ABCs were applied to a different policy issue, perhaps that of healthy eating. Those who are overweight commit, with certain penalties, to eating a certain amount every day. Now the behaviour change aims to increase personal benefits, rather than reducing harms, which is likely to be more controversial – especially if adults are the recipients.

- **How.** Even though these 'Acceptable Eating Contracts' would be very controversial, they still act within conscious control – people know they have signed up to them. Consider if the means of behaviour change acted mostly outside conscious awareness. Suppose the government used channels such as posters, labelling or certain turns of phrase to 'prime' people to eat healthily.[259] This role for government would be unfamiliar for people and may trigger charges of manipulation.

Figure 11 below illustrates how these hypothetical policies become more controversial based on the dimensions of Who, What and How. We have deliberately chosen an extremely controversial hypothetical policy so the illustration is as clear as possible.

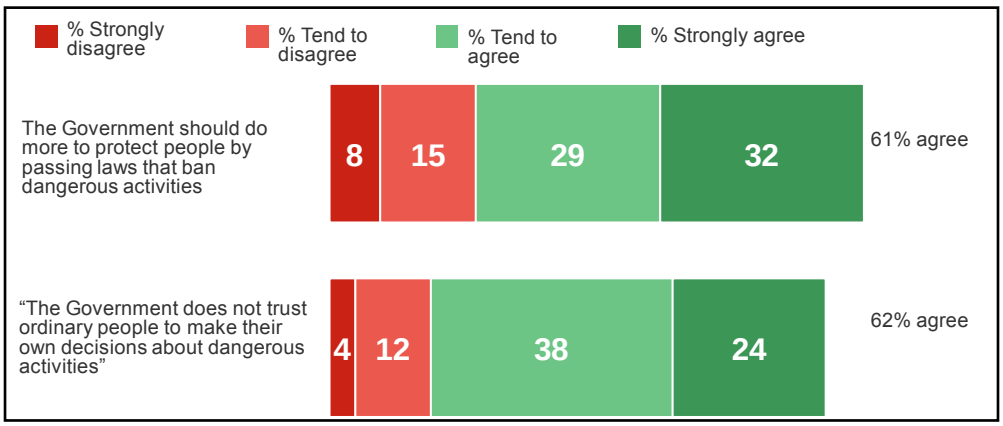
		Hypothetical policies			
		Acceptable Behaviour Contracts	"Adult Acceptable Behaviour Contracts"	"Adult Acceptable Eating Contracts"	"Priming for Acceptable Adult Eating"
Dimensions of controversy	Who	Children	Adults	Adults	Adults
	What	Harm to others (anti-social behaviour)	Harm to others (anti-social behaviour)	Benefits to self (healthy eating)	Benefits to self (healthy eating)
	How	Commitment	Commitment	Commitment	Priming

Less controversial More controversial

Figure 11: Illustration of potential controversy from hypothetical policies

The value of thinking this way is that policy-makers can identify potential ways of assuaging controversy, should they decide to proceed. For example, if the "Who" dimension is controversial, then more assurances of equity and tolerance may needed; if "What", then the quality and impact of evidence should be stressed; if "How", then the methods may need to be demystified and more explicit approval gained for using such methods.

It is very difficult to anticipate how policies will be framed and perceived



Nevertheless, some risks will always remain. It is very difficult to anticipate how policies will be framed by the media and perceived by the public: some aspects of a policy may be strongly supported while others reviled. Indeed, this type of public debate may be a healthy and necessary part of government's use of behaviour change; it may spark democratic engagement and lead to a clearer agreement on the proper role of the state.

Changing behaviour and personal responsibility

What does the public think – and why?

People want personal responsibility *and* a role for government

The most striking thing about public attitudes to government's involvement in behaviour change is that they show no clear underlying preferences. On the one hand 48% of people think that "people should be responsible for making their own decisions about their health and welfare" and on the other hand the same people think that it is the government's responsibility to influence people's behaviour to encourage healthy lifestyles.[260] The responses also show greater support for the state to 'influence' behaviour rather than to 'protect' people (which could be seen as more explicitly paternalistic).

Source: IPSOS Mori, 1,015 British adults aged 16+, January 1999

The Pensions Commission, for example, found that participants both a) wanted to make their own decisions *and* b) wanted to be told what to do, since they did not always feel they could make the right decisions.[261] Indeed, such imprecise and changeable attitudes have been found across a range of contexts. Our responses – like our behaviour – are influenced greatly by framing and by context. Whilst we sometimes recognise this about ourselves, we are not so good at appreciating it when assessing the behaviour of others.

When we are successful, we are likely to overlook the situational context (a good night's sleep, a lack of distractions) and claim full credit for achievements. But when we encounter failure, we are likely to blame the context rather than ourselves: when we get a parking ticket, we complain about the unclear information sign or the sluggish service at the dry cleaners; we don't dwell on the fact that we should have put more money in the meter.

We are biased towards explaining the behaviour of others in terms of their personality, not situation

On the other hand, we are biased towards explaining the behaviour of others in terms of their personal qualities (e.g. their intelligence or self-control), rather than the situation they find themselves in. For example, take two groups of people, and get one group to think up general knowledge questions to ask the others. Anyone watching is likely to think the questioners are more knowledgeable and intelligent than those answering – but this is irrational; they have forgotten that the situation gives the questioners more opportunity to look knowledgeable.[262]

Such considerations go to the heart of the debate about the boundaries between government and personal responsibility. We are predisposed to see the actions of others as a result of their *personal* actions, and thus products of their personal responsibility. Similarly, we think that our achievements result from our personal efforts. At the same time, we are predisposed to think of all the misfortunes that led to our problems, which may imply that outcomes are also based on circumstances, as well as personal resources.[263]

Perceptions of personal responsibility: the example of health

Evidence across a range of contexts using a range of methods shows that the general public hold individuals responsible for their health and wellbeing.[264] There is also evidence in support of focussing on lifestyle as the main cause of conditions such as obesity.[265] Such survey evidence is useful, but we also require information on how the general public – in their roles as citizens and as taxpayers – weigh concerns for reducing inequalities on the one hand against holding individuals responsible for those inequalities on the other. An inequality only becomes an inequity when the causes of the inequality are seen to be outside of people's control.

One popular way of thinking about this is to judge whether the behaviour is seen as the result of 'bad luck' or 'bad choices'. Consider the fact that, controlling for health status, men consult their GPs less than women do. On the one hand, it could be seen as 'bad luck' to be a man, in the sense that factors beyond his control (e.g. society's demands for men to be 'macho') determine his behaviour. On the other, his behaviour could be seen as 'bad choices' that he can be held to account for.

In terms of policy-making, the public may be more likely to approve any support measures for such a man if they think in terms of 'bad luck', rather than 'bad choices'.[266] This may be related to people's strong instinct for reciprocity, which implies help is justified if someone has taken appropriate actions to improve their situation, even if these were not successful.

However, there is some evidence that attitudes vary between policy areas: while 78% of respondents said that it was right to limit access to benefits if an unemployed person was not actively looking for work, just 24% said that it would be right to limit NHS medical treatment for someone whose illness was due to heavy smoking or drinking.[267]

The overall message, therefore, is that we tend to attribute outcomes to people's personal actions. But what exactly do we mean by personal *responsibility*?

What is personal responsibility?

When we speak of 'personal responsibility', we are often conflating at least three different concepts:[268]

1. ***Causal responsibility.*** Many of our actions (or failures to act) expose us to certain consequences that others don't face – playing rugby is more likely to result in injury than playing the piano. How far should people experience the consequences of their actions (or failure of action), and how far should others relieve them of these consequences?
2. ***Moral responsibility.*** In what circumstances is it fitting to judge someone by the standards of good conduct we expect of ourselves and others? For example, most people would not judge someone morally responsible for committing a crime if they were mentally ill at the time. It is more difficult if someone commits wrongdoing when acting under duress, as when someone steals from their employer to pay kidnappers.[269]
3. ***Role responsibility.*** These are the responsibilities that people assume in a certain context, organisation or community. These can be more formal (spouse, doctor, minister) or informal (friend, neighbour, citizen). We usually recognise that the actor who is best placed to address a problem or prevent it happening again may not be the actor who caused it. Sometimes the best placed actor may not be an individual, but government - therefore,

the public often accepts that government has some role responsibility to provide public services or address societal problems.

Government involvement in changing behaviour is not mutually exclusive with personal responsibiltiy

The most important point is that the government's involvement in changing behaviour is not mutually exclusive with personal responsibility. Personal responsibility is often seen as a 'zero-sum game': in other words, "if the state's taking responsibility, that means I am not". But it is perfect possibly for government to just supply the trigger or support for individuals to take greater personal responsibility.[270] This is particularly true for those aspects of MINDSPACE that rely more on the Reflective system. For example, the Prime Minister's Strategy Unit has found that the process of developing, agreeing and monitoring personalised agreements between services and citizens can prompt more responsible behaviour.

If government were to use commitment devices to make an initial change to behaviour, then people may build on that initial change and start taking personal responsibility in related areas. Recycling of bottles may lead to broader pro-environmental behaviours; stopping smoking may encourage greater exercise. In other words, government may spark initial changes that lead to reinforcing behaviours that manifest personal responsibility; the fact that government supplied the initial push does not devalue the subsequent responsibility.

The moral hazard problem

Nevertheless, an important concern that plays directly into the general effectiveness of behaviour change interventions is the 'moral hazard' problem. If we think the state is making decisions for us, we may absolve ourselves of the responsibility to take charge of our own behaviour. This is a statement about how the world is, rather than a value judgment, although the degree of moral hazard varies from case to case.[271] Therefore, government may wish to be careful to frame behaviour change as a pathway to increased personal responsibility.

How does MINDSPACE affect ideas of personal responsibility?

We think people can be held responsible if they can act rationally with some freedom of choice

Clearly, judging whether and how much someone is responsible for an action depends greatly on their circumstances and our judgment. But there are some basic principles we apply when considering whether someone can be held responsible or not: we don't judge the insane in the same way as the sane, for example.[272] In essence, we think people can be held responsible if they can act rationally, supported by substantive freedom of choice.

It has long been accepted that some citizens may be in a state where they cannot exert rational responsibility for their actions: whether because they are children, mentally ill or (more controversially) in the grip of addictions. On the other hand, most adults are seen as capable of reason, and hence responsibility, although they may not achieve such responsibility because of weakness of will.[273]

Evidence from behavioural economics on the importance of the Automatic System complicates this view. As the Nobel Prize-winning psychologist Daniel Kahneman has observed: "We tend to believe that somebody is behaving that way because he wants to behave that way, because he tends to behave that way, because that's his nature. It turns out that the environmental effects on behaviour are a lot stronger than most people expect."[274]

Contextual influences on behaviour can be both powerful and unnoticed

Of course, we may still reconcile personal responsibility with this view. We may say that, although these environmental effects are strong, it is up to the responsible individual to resist them where damaging to their wellbeing. But these are not the 'environmental effects' of traditional political debate, which must be ameliorated by government or overcome by individuals and communities. Rather, they offer a challenge to our understanding of how we think: as we have seen, many of these effects are not only strong but also operate with little or no conscious control.

Can people resist things if they are not aware of them?

Can people resist things if they are not aware of them? How much substantive freedom do their 'reflective selves' actually have? Does this affect the way that we hold people causally or morally responsible? Certainly, it seems there is a considerable challenge to a strict understanding of responsibility: 'Responsibility requires that an agent acts in a reason-responsive way *that he accepts as a way of acting on his own reasons.* An agent whose ['Automatic System'] is manipulated by other agents in ways he would reject (were he aware of them) does not meet this condition for responsibility.'[275]

There *are* instances where effects can be produced that are both unconscious and in opposition to conscious will.[276] But most of the time things are usually more complicated: people often have *some* opportunity to decide differently when being influenced.

Usually people have some opportunity to decide differently when being influenced

For example, it has been shown that the mere use of the word "because" triggers a powerful compliance reaction. When a group of people waiting for a photocopying machine were asked "Excuse me, I have five pages. May I use the Xerox machine?", only 60% of those asked agreed. When the phrase was changed to "Excuse me, I have five pages. May I use the Xerox machine because I'm in a rush?" compliance leapt to 94%.[277]

But it was not simply the act of giving a reason that made the difference, it was the automatic reaction triggered by the word "because": when the phrase was simply "Excuse me, I have five pages. May I use the Xerox machine because I need to make some copies?", compliance was 93%. The 'Automatic System' had reacted to "because", even though the Reflective system could have seen that no reason had been given.

The fact is, though, that 7% of respondents did not respond to this automatic effect. This may have been because their reflective systems cut in, they had a moral objection to queue jumping, or they were uncaring or in a rush. Regardless, it appears that there was *some* freedom of choice. But other situations are more difficult: what if the person concerned happens to be mentally or emotionally vulnerable at the moment they are exposed to the effect, through no fault of their own?

Judgments of personal responsibility need to be informed by evidence

In sum, MINDSPACE points out that we are all strongly affected by factors that may lie outside our awareness and control – and this complicates our understanding of personal responsibility. In practice, the question of how far MINDSPACE effects preserve substantive freedom, and in which contexts, is likely to come down to political judgment. Nevertheless, it should be informed by the evidence available: we need to acknowledge the nature and strength of the proven influences on human behaviour. This is one of the fundamental purposes of our report.

Conclusions and future challenges

Conclusions

MINDSPACE is pervasive

For policymakers, professionals and communities facing policy challenges such as crime, obesity, or environmental sustainability, behavioural approaches offer a potentially powerful new set of tools. Applying the insights of MINDSPACE can lead to low cost, low pain ways of nudging citizens - or ourselves - into new ways of acting by going with the grain of our automatic brain. This is an important idea at any time, but especially relevant in a period of fiscal constraint.

Policymakers could, in theory, seek to restrict the use of behavioural change approaches in general, such as banning advertising and other forms of marketing. But as we have seen, behavioural influences go well beyond the narrow remit of advertising. Policy-makers could seek to equip the citizen with an armoury of techniques to resist the influences that swirl around them - lessons for our children in 'unwanted influences and how to resist them'. Such ideas have merit, but they also have serious limitations, not least the fact that many influences (such as priming effects) are quite hard to detect.

We are being influenced – and influencing others – all the time

More fundamentally, policy-makers need to understand that we are being influenced –and influencing others – all the time. This does not always lead to change. Indeed, many of the influences on our behaviour are more 'anchors' than nudges. What we eat, where we go, what we do – most of us are creatures of habit and, in a very general sense, the environment that we live in. The point is that government often forms a significant part of this environment, whether intentionally or not.

Therefore, policy-makers can use MINDSPACE to better understand the various effects on behaviour their policies may be having. Fundamentally, government will always be shaping choices: is the pension scheme opt-in or opt-out? Who is communicating the message? Behavioural science will continue to turn previously invisible influences into explicit choices, and policymakers and professionals into 'choice architects' whether they like it or not. And the more we come to know about behavioural effects, the less 'neutral' doing nothing will appear.

Whether reluctantly, or enthusiastically, today's policymakers are in the business of influencing behaviour. One way of thinking about this is to view the role of the policymaker or public servant as trying to shape influences around us to maximise the public and private good, while also leaving as much choice in the hands of citizens as possible. This is what is known as 'libertarian paternalism', but it does raise questions of its own.

Public permission matters

Public approval is needed

The more powerful and subtle behavioural change approaches are, the more they may provoke public and political concern. Citizens may accept their application on other people, but may not be so happy about their use on themselves. Behavioural approaches embody a line of thinking that moves from the idea of an autonomous individual making rational decisions to a "situated" decision-maker, much of whose behaviour is automatic and influenced by their 'choice environment'. This raises the

question: who decides on this 'choice environment'? This question has attracted remarkably little attention. Policy-makers wishing to use these tools summarised in MINDSPACE need the approval of the public to do so. Indeed, these approaches suggest an important new role for policymakers as brokers of public views and interests around the ecology of behaviour.

Future challenges

Reducing inequalities

An exciting but unresolved question thrown up by MINDSPACE is whether it has any effect in reducing inequalities. Most traditional policy interventions aim to 'change minds' – to produce rational changes in the way people think - in order to bring about behaviour change. Many (but not all) persuasion and education campaigns still aim to change attitudes and then behaviour by relying on rational use of the information provided.[278]

But who is most likely to benefit from such interventions? The intuitive answer is that more educated individuals are more likely to comprehend such information and, as result, act on it. More educated individuals, the argument goes, are also more likely to have the habit and the resources to search for more information which will provide them with even more reasons and tools to change their behaviour. Indeed, it is well-established that better education causes better health.[279] Therefore, it may be that information campaigns widen inequalities in health and welfare, since they may reflect the fact that some citizens have a greater capacity (in the broadest possible sense) to change their behaviour.[280]

MINDSPACE may be a more efficient and equitable way of influencing behaviour than information provision

In contrast, the 'Automatic System' relies mostly on contextual changes to bring about behaviour change, without necessarily changing people's minds. The effects of such contextual changes are therefore likely to be less dependent on education and income. In other words, it may be a more efficient *and* equitable way of influencing behaviour. As already noted, there is evidence that changing the pensions default to automatic enrolment brought a particularly large increase in take-up for low and medium income workers, eliminating most of the previous differences in participation due to income, sex, job tenure and race.[281] Overall, though, evidence on the distributional consequences of MINDSPACE is still sparse, and so there is a real need to evaluate whether it offers a way of using resources more efficiently and fairly.

How long do MINDSPACE effects last?

Policy-makers reading this report may have a nagging question: how long do MINDSPACE effects last? Is their impact on behaviour ephemeral or enduring? How long should my intervention last?

Psychologists sometimes make a distinction between 'compliance' and 'conversion'.[282] For example, someone with racist views may nonetheless be careful not to show discriminatory behaviour at a job interview or when they are in a public setting. But in private, or one-to-one settings, they might show strong discrimination. In effect, they show compliance when under scrutiny, but they haven't converted, so their behaviour is prone to revert at any time.

We assume that the goal of any attempt to change behaviour is to create an *enduring* change – indeed, one that becomes self-sustaining – although policy-makers may also reckon that compliance is better than nothing. We suggest that enduring change can be achieved through 'trigger' effects, 'self-sustaining' effects, and cultural change. We explain each of these below.

'Trigger' effects: are these only fleeting?

Temporary effects do not mean fleeting impacts

As discussed earlier, some MINDSPACE effects are rapid and even subconscious, notably **priming, salience**, and **affect**. On the face of it, their influence appears fleeting. Thus, the effects of priming may only last for a short while after exposure to the prime. But this does not mean that their *impact* is fleeting, since the behaviour and decision may have been changed in that interval.

These effects may be thought of as 'triggers'. Priming may only last a short while, but during that time it may lead to someone making a commitment that translates into longer-lasting change. But people are not only a bundle of reflexes. We can 'habituate' to repeated prompts, and we can learn to resist or reinterpret them in other ways. For example, a very effective trick is to give a busy stranger something – such as a flower – then immediately ask for some money. Because of the power of reciprocity, most people will automatically comply with this request, and probably be annoyed with themselves afterwards. But they are unlikely to fall for this ploy more than one or two times.

The fact is, there is relatively little practical evidence about how the impact of frequently used effects might habituate over time. Success will probably depend on whether the citizen is broadly happy with the result – in other words, the reinforcement that follows it. For example, smokers trying to quit deliberately try to avoid some of the primes that encourage their smoking, such as the habit of having a cigarette with a drink. MINDSPACE effects that direct them away from smoking are likely to be welcomed rather than consciously resisted (unlike the flower trick mentioned above). The effect is then reinforced by the sense of feeling good.

Hence one intervention helped people to develop healthy habits by using the method of context-dependent repetition, which was delivered in the form of information or advice on weight control, such as "try to eat roughly at the same times" and "plan ahead to find ways to incorporate the behaviour into daily routines".[283] This approach recognises the power of automatic responses to context and tries to harness them for a specified goal.

Behavioural triggers can be built into situations and contexts

It is important to note that though behavioural triggers may be short-term in their influence, they can be repeated by being built into situations and contexts. For example, as mentioned earlier in relation to a dangerous road in Chicago or the approach to some junctions in the UK, the increased salience of driving speed can been 'built into' a road by the simple act of painting white lines.[284] And, of course, if a short-term effect causes many people to change their behaviour, this itself creates new kinds of social influence, notably the possibility of moving people to a new 'behavioural equilibrium' (see below).

'Self-sustaining 'effects: changing the equilibrium

At first glance, influences such as **social norms**, **defaults** and **ego** effects appear to rest on deep-seated aspects of the environment and ourselves. For example, it may be much harder for the policy-maker or community to change the social norm, but if they can there is good reason to think that the effect will be widespread, lasting and self-sustaining.

The most obvious example is defaults. For a start, the use of defaults is based on the status quo bias, which encourages stability and minimum effort over time. Governments have considerable control over many defaults, such as around pensions, insurance rules or what side the steering wheel is on our cars. Not surprisingly, defaults have become perhaps the most widely known element of behavioural economics.

Other effects have a self-sustaining dimension, though. Commitments, for example, are based around fidelity to a decision over time (assuming that this decision can be obtained in the first place). They 'go with the grain' of how we act

Some effects have a self-sustaining dimension, but their duration is not guaranteed

by recognising that small changes in behaviour may lead to a subsequent change in attitudes. However, the effects of commitments are less guaranteed to last than defaults – if the costs of keeping to the commitment become higher and the consequences less salient, the change in behaviour may not be sustained. In short, there is greater scope for interfering factors.

Norms also have a powerful self-sustaining element, but again their duration is not guaranteed. As explained, norms can be explicit (where someone tells you what others do) or implicit (where you observe what others do). We saw earlier that the explicit social norm effect declined in the months after letters were sent out detailing neighbours' energy consumption, but increased again on receipt of subsequent letters.[285] Implicit norms are powerful and self-reinforcing, but government's difficulty here is how much effort is required to trigger a new, sustainable norm. Social norms may change very slowly or quickly, they may change because of a large, sudden event or a single invisible decision that creates a 'tipping point'.[286]

Compensating behaviours

People may compensate with other acts if their behaviour is changed

Short of trying out a given intervention, we cannot be sure how much any given MINDSPACE effect will lead to other 'compensating behaviours' over time, as often occur when attempting to 'change minds'. For example, we may eat more when we give up smoking because we cognitively decide to quit smoking, but does the same thing happen when we give up because the context has caused us to quit? Or, while smaller plates may make us eat less initially, will we start to pile plates higher in compensation? In this example, there are reasons to think not, since evidence shows that levels of eating are strongly linked to the context and availability of food (at least once a certain level of hunger has been satisfied), but the general challenge stands.

Again, this points to the need for Insight to gain understanding of the people whose behaviours you are attempting to change. For example, the geographer John Adams argues that we each have an individual built-in 'risk thermostat' – a level of risk we are ready to tolerate – which is a largely automatic instinct, derived from the accrual of experiences throughout our lives. Adams argues this means that changing behaviour so people wear motorcycle helmets may actually increase the likelihood of accidents: the risk thermostat kicks in, and people feel there is more scope to drive faster as a consequence. Insight could therefore help understand how people perceive and tolerate risk, and help build an intervention that limits compensating behaviours like these.[287]

Evidence from some policy areas, such as crime, suggests that compensating and displacement behaviours tend to be relatively limited. But in other policy areas substantial and problematic compensatory behaviours have been found. For example, it has been argued that attempts to reduce CO_2 emissions through encouraging people to drive smaller, more efficient cars are substantially offset by people's subsequent tendency to drive more often.[288] And, of course, individuals' behaviour should be seen as the product of a wider system: if the pressures and incentives in this system remain the same, a person's attempts to change their actions may not be sustained, and compensating behaviours may emerge instead.

From behaviour change to cultural change

MINDSPACE can create or change habits by going with the grain of behaviour: harnessing automatic effects

As we have seen, much of behaviour change is about battling habits – either to change them or to use other habitual or hard-wired responses to nudge ourselves in a different direction. Habits are 'behavioural dispositions to repeat well-practiced actions given recurring circumstances', and they usually develop when actions are repeatedly paired with an event or context (e.g. drinking coffee after waking up).[289] Although the initial pairing may have had some conscious purpose, once acquired

the action can be triggered just by the event or context, even in absence of the person's intention – or even in opposition to their intention.

Often attempts to break habits rely on providing information, but conscious thoughts may not provide an effective means for addressing automatic behaviour – not least because people often shape their views around their behaviour.[290] In contrast, MINDSPACE suggests that the most effective way of changing or creating habits is by going with the grain of behaviour: harnessing the same automatic effects to nudge people onto a different, self-sustaining, track, without always explicitly stating the need to pursue a particular goal.

Habits do not just exist at the individual level

But habits do not exist at the individual level only. When replicated across a community or society we call them 'culture'. The Italians drink on average 48 litres of wine per year, while Britons drink less than half that amount.[291] In contrast, the vice of the Scandinavian nations is coffee: Finland, Norway, Sweden and Denmark fill the top four slots for consumption, drinking more than five times the level we do.[292] Sometimes such differences exist within countries too, such as differences in smoking across socio-economic groups in the UK.

Ultimately, most policymakers are focused on this bigger picture – often known as culture change.[293] There may be occasions when the power of argument alone can eventually such culture change, such as gender equality or race relations. But generally the broader sweep of policy history suggests that such change is driven by a mix of both broad social argument and small policy steps. Smoking is perhaps the most familiar example. Over several decades the behavioural equilibrium has shifted from widespread smoking to today's status as an increasingly minority activity. Better information; powerful advertising (and the prohibition of pro-smoking advertising); expanding bans; and changing social norms have formed a mutually reinforcing thread of influence to change the behavioural equilibrium.

There is every reason to think that is a pattern that we will see repeated in many other areas of behaviour too, from sexual behaviour to carbon emissions. At the same time, new behavioural challenges will surely emerge too. For example, the UK leads the world in per capita spend on video games – roughly four times that of Germany and nearly 20 times the world average.[294] Is that a virtue or vice? We may have to wait a generation to decide.

What we can be sure of is that culture change is around us all the time, and communities and governments will continue to take views on how they do, and do not, want it to unfold.

The future of behavioural policies

Some leading proponents have portrayed the application of behavioural economics as a radical 'third way' between liberal and paternalistic approaches to government. Others have tended to dismiss the approach as a distraction to the robust application of 'normal' economics to policy. In crude terms, the first camp says the way to reduce carbon emissions is through harnessing the power of techniques such as comparisons with our neighbours' emissions; for the second camp, it is simply to get the price of carbon right, and then to let markets sort it out.

Not a paradigm shift in policy-making, and not a reason to give up on conventional policy tools

Our position sits between the two camps. The application of behavioural economics does not imply a paradigm shift in policy-making. It certainly does not mean giving up on conventional policy tools such as regulation, price signals and better information. Sophisticated behavioural programmes to reduce smoking or excess drinking don't imply giving up on taxes on cigarettes and alcohol. Similarly, programmes to persuade us to eat five portions of fruits or vegetables a day mean still have to address practical barriers such as how the lack of supply of fresh food in poorer neighbourhoods.[295]

We can be confident that behavioural economic approaches offer policymakers powerful new tools, but there is still much that we do not know. There remains uncertainty over how lasting many of the effects are; how effects that work in one set of circumstances will work in another; and whether effects that work well with one segment of the population will work with another (including potential impacts on inequalities – though there are grounds to think that more automatic approaches will tend to reduce them).

Who should act?

There are also questions about how much such techniques should be employed by central government or left as tools for local policymakers, professionals and communities. One of the most important roles for central government in the coming years will be to ensure that local and professional applications of behavioural approaches are rigorously evaluated, our knowledge systematically built, and the results made available for communities to debate and adopt as they see fit. When the cost-effectiveness for an application is clearly shown, and the public acceptability has been established, central government might then move to national implementation – be this to reduce crime, strengthen communities, or support healthy and prosperous lives.

We saw at the beginning of this report how our decisions over a short time at lunch are influenced by the context within those decisions are made – by various elements of MINDSPACE. Accounting for these effects in public policy could result in resources being used both more efficiently and more fairly. There may turn out to be a free lunch after all.

Ideas for action

Changing policy-making

Nudging professionals. Breaking down all-in-one tick-box orders of medical tests into smaller blocks with costs and frequency of use alongside. Magistrates, doctors, and police provided with information on how their decisions compare with those of average and gold (evidenced-based) standard.

Downplay negative norms. As we have seen, stressing the prevalence of an undesirable behaviour can make people more likely to indulge in that behaviour themselves. A better tactic is to make these activities seem minor and socially undesirable, thereby bringing 'in-group' effects on your side.

Help policy-makers reduce the debt burden. Applying MINDSPACE to reducing the fiscal deficit, from building a mandate with the public to creating a dynamic of collective ownership across Departments to reduce costs.

An institutional centre for evaluating behavioural change. There is a good case for establishing a central competence that can evaluate behaviour change. This does not need to be a new body, but it does need scientific competence and a degree of independence. The centre would be tasked with determining which methods were most effective and cost-effective for changing specific behaviours.

A "Dragon's Den" for innovative behaviour ideas. Professionals and communities who come up with innovative ideas have a means of submitting their ideas for consideration. Those that get through an initial selection process are invited to pitch to a panel of experts; convincing cases are given support for piloting and evaluation, and, if shown to be effective, assistance to help wider participation and follow-up.

Changing policies

Obesity in schools. Use all we know about choice architecture in school canteens to improve diets, such as increasing the prominence of healthy foods and offer a national points programme for healthy eating and exercise, with a range of rewards offered to classes, schools and cities.

Helping people help themselves. Use self-exclusion agreements to restrict access to online casinos and betting sites. Set up a central website funded by gaming industry that allows people to sign agreements restricting access to all registered online gaming sites.

Making the money go further. Refashion taxes, grants and benefits using behavioural economics. For example, front-load grants to disadvantaged students to make university feel more attractive, and offer lower but less variable tax credit options to those on variable incomes.

Citizen-to-citizen welfare. Online tax-free credit system set up to promote exchange of care services between citizens, harnessing reciprocity on the lines of the Japanese system of *fureai kippu* (care credits for social care) or the US Elderplan (where ex-patients help recent or current patients).

Annex 1: MINDSPACE mapped

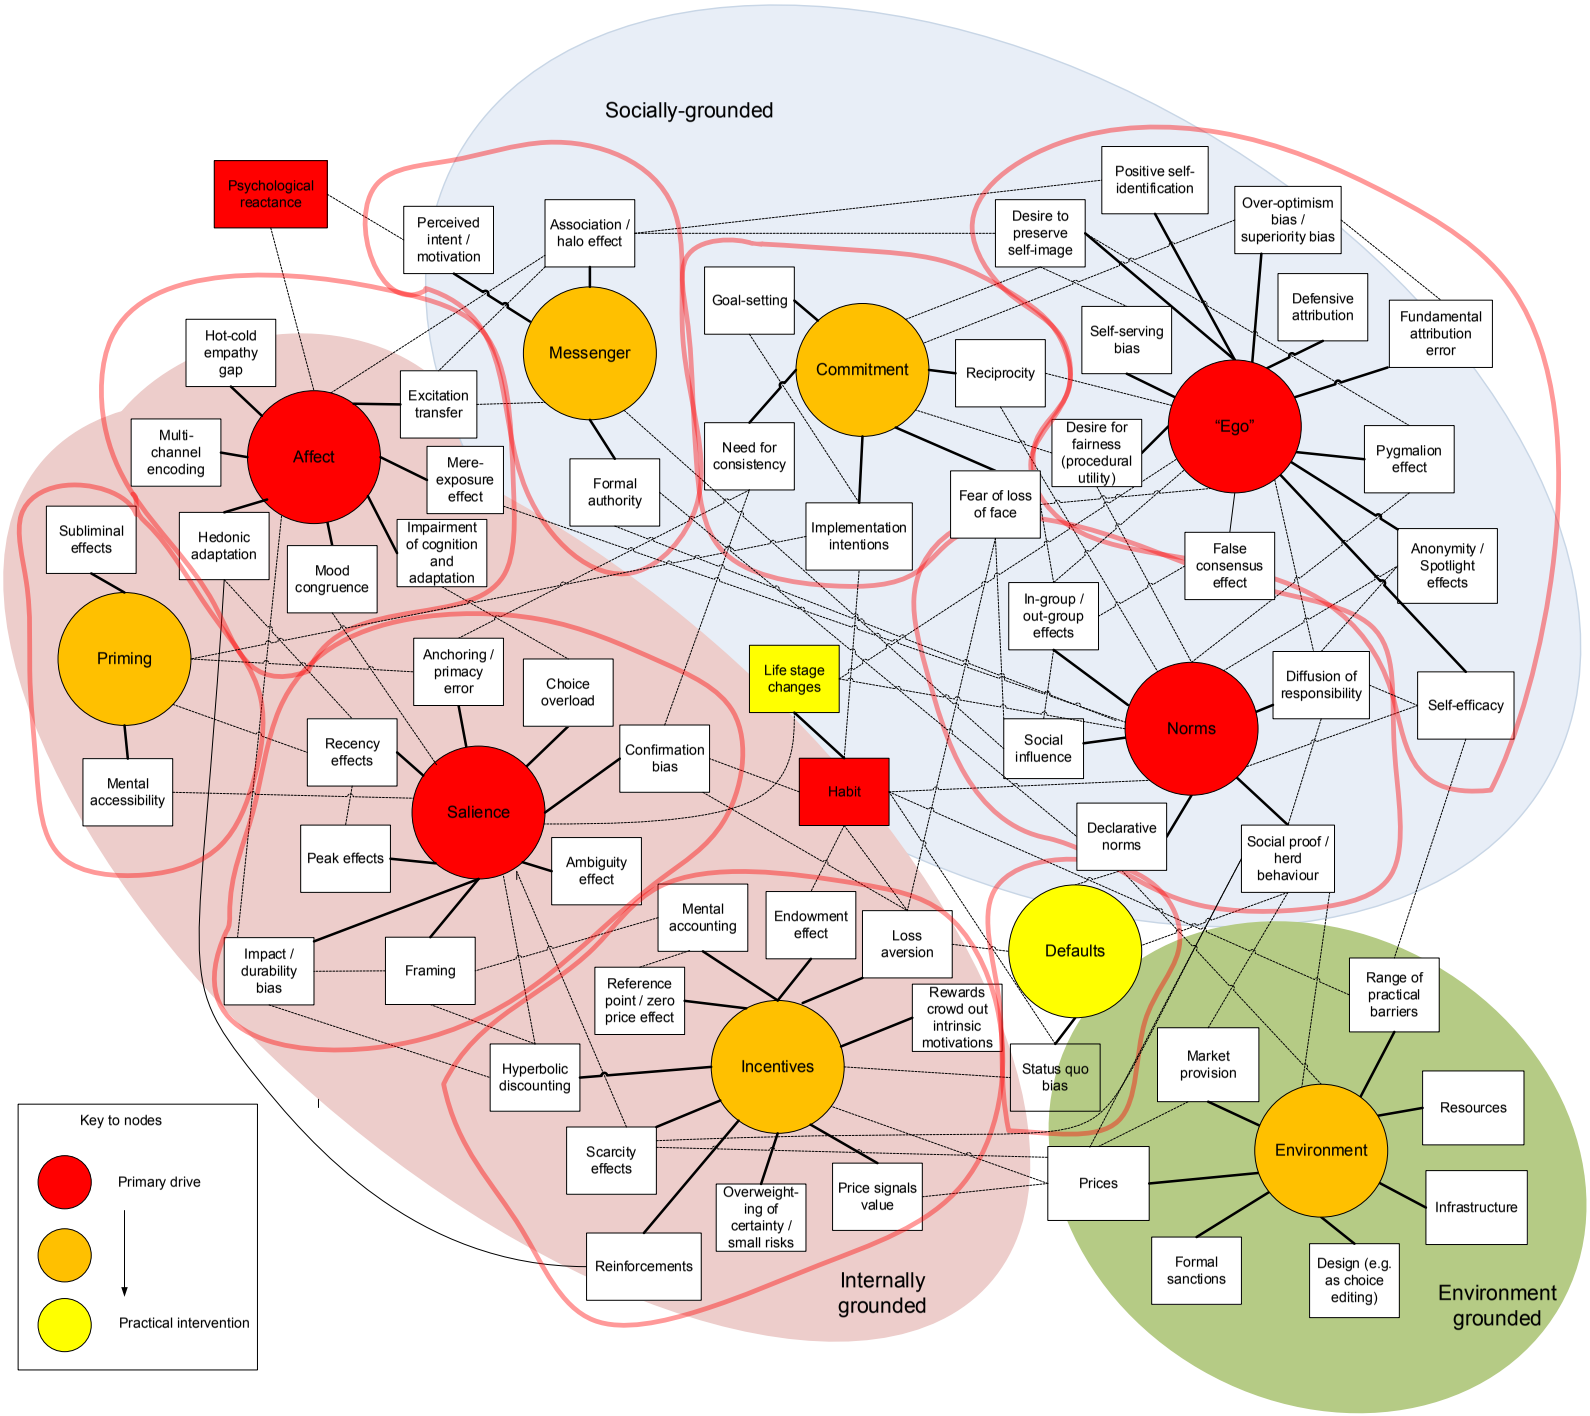


Diagram presenting the concepts related to the elements in MINDSPACE. The solid lines indicate that a given psychological process is considered as being an essential part (as a direct consequence, cause or manifestation) of the principle in question (e.g. framing is making something salient, while salience causes recency effects). The dotted lines are secondary connections, while the red/orange/yellow colouring of the circles denotes whether the factor is a primary drive (e.g. affect) or whether it is more applied (e.g. defaults). The red grouping lines denote the boundaries of MINDSPACE.

More details on the terms in the diagram can be found in:

Hewstone, Stroebe, Jonas (2007) *Introduction to Social Psychology: A European Perspective*. Chichester: Wiley, Fourth Edition.

Annex 2: Applying MINDSPACE to teenage pregnancy

A local authority has identified that it has unusually high rates, compared with comparable areas, of both teenage pregnancies and STDs. They have been set a challenging LAA target for National Indicator 112 (PSA 24) 'Under 18 Conception Rate', but their performance indicators are not moving. How can MINDSPACE offer a new approach?

Explore

The Local Authority brings together key figures from the PCT, local schools and the local community to assess levels of interest and current local strategies. This starts to identify ideas about what might be going wrong in the local area, and establishes common interests and resources to explore the issue further.

Insight research is commissioned locally involving focus groups and some one-to-one interviews (given the personal nature of the subject). This research explores the thoughts, feelings and pressures on teenagers (including teenage parents) and their parents. Evidence is also drawn from the new 'What works?' data bank of previous evaluations and international evidence funded by several large central government departments.

Insight found that one of the weaknesses of information and leaflets was that it concentrated on facts and figures about sex and STDs rather than the more potent influences on behaviour such as self-image and social pressure (Ego and Norms). For example, young people often felt unsure about how widespread sexual activity was, and those who were engaging in early sex felt uncomfortable about the reaction of their partner if they insisted on contraception, since it might imply they were already promiscuous or that it somehow implied they didn't trust their partner. It was also found that many young people did not relate to national-level statistics and figures.

Ironically, the local practice of having previous teenage parents come and talk to children in schools about why they regretted getting pregnant so young was found to have the exact reverse effect on many young people. It helped them imagine themselves in that situation (Salience), made it seem more normal (Norms), and the young mothers themselves seemed rather impressive and grown-up (Messenger).

Finally, it turned out that a major driver of early sexual activity, and indeed lower educational attainment and behavioural problems in the classroom, turned out be rooted in self-image. Many young people felt caught in a frustrating dynamic of 'being treated like a child at home and school', and, in a slightly jumbled way, felt that sex was a route to being respected and treated as an adult (Ego).

Enable

For the most part, lack of information about safe sex was not fund to be a major barrier, but there was evidence that there were some specific gaps in knowledge, such as some practical aspects of birth control use and a lack of understanding of the long-term effects of certain STDs. Sex guidance and information was therefore updated. Supply of contraception, including the cost of condoms, was a barrier in some at-risk younger groups, and dispensers were added in school toilets – within cubicles rather than more public areas to avoid unwanted social pressure.

Encourage

Salience and Norms

Recognising the importance of self-esteem rather than facts, leaflets and classes were changed to focus much more heavily on how other people, including peers and the other sex, felt about birth control. In order to make statistics more Salient,

a local survey of relationships and sexual behaviours was organised by parents and a local school nurse. Students found the results from the local survey far more salient, and it also served to break the taboo of younger age sex and relationships. Many young people were surprised to find out that far fewer of their peers were having sex than they thought, which they felt removed pressure on them (Norms).

Messenger

Schools also took a new approach to visits: rather than inviting *just* teenage mothers in to talk, they set up a panel of five former pupils to talk about their lives and relationships. Just like the teenage parents, they were articulate and impressive – but, of course, most of those who left school were not teenage parents. A typical panel of 20-something ex-students had three who were not parents, of whom one was recently married, one was in a long-term relationship, and one who had recently broken up. The fourth was also recently married and had just had a child. The fifth, on some of the panels, had been a teen parent. In other words, various 'alternative futures' were made Salient, while it was clear that the dominant Norm was not being a single mother.

Commitment

Some schools and parents experimented with 'compacts' – students would actually make a pledge with themselves as part of PHSE classes that, if they were in a relationship, they would agree with their partner to use birth control (Commitment). Though some felt these 'compacts' were embarrassing, many subsequently felt that they were glad that they had done so.

Engage

Many of the elements of the Borough's programme on teenage sexual behaviour were controversial. Engaging with parents, professional and children was an important part of getting 'permission' for the programme. The local authority had to stress the scale of the problem in the area (although not to teenagers, to prevent an undesirable social norm), and the difficulties that can ensue from teenage pregnancy. The engagement itself helped to raise the profile of the issue and increased the acceptability of talking about sex and relationships in the area, thereby creating a self-reinforcing social norm.

Exemplify

In this instance, the local authority recognised that it would find it difficult to exemplify actions that lead to lower teenage pregnancy. Therefore, it mostly restricted its activities to ensuring that it was giving a consistent message on the desirability of teenage pregnancy in all its areas of activity. In terms of policy-making, it was recognised that the Commitment to reach a certain LAA target had encouraged the local authority to think differently. In addition, a local health worker gave a hard-hitting presentation to the local authority's team on the real emotion and social problems teenage pregnancy was creating in the local area (Salience and Affect). As a result, the Default approach to information provision had been shifted from 'neutrality' to 'socially situated' – unless decided otherwise, all information would be geared towards affecting self-esteem issues and social pressures felt by teenagers.

Evaluate

There were various elements to the programmes that were tried in the area. Schools and communities tended to use slightly different combinations. The evaluation used this variation, or tapestry, of interventions to test the relative efficacy of different aspects of the programme. Outcome variables included levels of STDs, teen pregnancy rates, and a repeat of the local survey on sexual behaviours.

Annex 3: New frontiers of behaviour change: Insight from experts

This annex gives short insights into some of the latest developments in behaviour change from world experts.

1. Virtual Worlds to test behavioural interventions

Virtual worlds are three-dimensional environments found online in which communities of networked individuals interact. Millions of people use such platforms and they have become increasingly sophisticated. Within such worlds (e.g. Second Life) individuals can make friends with like-minded people or even do their weekly shopping. Researchers in my department are currently using this technology to teach medical students how to be good doctors.

The potential exists to use virtual worlds to test out some new policies in the area of behaviour change. In the past we have spent large amounts of money on interventions to change behaviour with little idea of whether they will work or not. It may be that we can try out various interventions within virtual worlds first, so as to get an idea of their potential impact. Chesney has recently explored the use of virtual worlds for experimental economics. Overall the behaviour of virtual subjects was not found to differ significantly from established standard results, suggesting their usefulness as experimental subjects.

Professor The Lord Ara Darzi, Professor of Surgery, Imperial College London. Formerly Under Secretary State for Health

2. Evaluating behaviour change policy

The next steps for behavioural economics are large field studies on policy, since data collection may challenge governments' intuitions. Academics could also invite people who are involved in legislation to come and present the assumptions they are making about human behaviour, give them some feedback and work together on changes. Examples could be legislation about driving while texting, energy usage, income tax, calorie labelling, and so on.

Professor Dan Ariely, Alfred P. Sloan Professor of Behavioral Economics, Massachusetts Institute of Technology, author of Predictably Irrational *(HarperCollins: 2008)*

3. Neuroeconomics

Neuroscience now offers profound insights into how the human brain implements high level psychological functions, including decision making. Such knowledge when combined with insights from other disciplines has spawned new disciplines, a pertinent example being the field of neuro-economics. This new field has already generated remarkable findings into questions as diverse as how people learn in an optimal fashion, how human preferences are formed and the mechanisms that explain common deviations from rationality in our choice behaviour.

The wider impact of these findings is that they suggest a profound revision in how we construe the architecture of the human mind. It now appears that the brain comprises not a monolithic single executive decision making system but instead comprises multiple distinct decision-making systems, each competing for control over choice behaviour. The obvious analogy here is that of a parliament of the mind. The challenge now is to understand how these systems interact during the expression of behaviour including how they impact on self-control. A deeper understanding here is likely to provide insights into the types of interventions or triggers that

engage these distinct systems, with potential beneficial or indeed detrimental effects. It opens the distinct possibility that we can implement effective policies that can provide powerful, yet simple, tools that engender change in behaviour across of range of societal contexts include our health service, schools and our general social environment.

Professor Ray Dolan, Director of the Wellcome Trust Centre for Neuroimaging, University College London

4. Influencing behaviour through design

Winston Churchill wrote: 'We shape our buildings; thereafter they shape us." The built environment presents a series of 'clues' to the public and effectively gives them permission to do certain things or behave in certain ways. Whether it is the corporate employer which creates social spaces to encourage informal collaboration across disciplines inside its office building, or the transport operator which deliberately denies passengers even surfaces on which to place and discard coffee cups on the subway system, organisations have used design to encourage behaviours best suited to their mission.

Today one the leading-edge areas in which design can influence behaviour change is in relation to safeguarding the environment. Having well-designed recycling facilities can support greater recycling by communities, for example; giving home owners immediate and understandable visual feedback on the amount of energy they are consuming can encourage a reduction in energy use.

Jeremy Myerson, Helen Hamlyn Professor of Design, Royal College of Art

[82] Experiments have shown that people will refuse an offer of money if: a) they feel it has been allocated through an unfair process and b) by refusing they can punish the person who allocated it unfairly. See Werner, Schmittberger, Schwarze (1982) An Experimental Analysis of Ultimatum Bargaining. *Journal of Economic Behaviour and Organisation* 3(4): 367-88.

[83] See Cialdini (2007) *Influence: The psychology of persuasion*. New York: HarperBusiness, Revised Edition, Chapter 1.

[84] These are known as *attribution biases*, and they share the common tendency to over-value dispositional (i.e. personality-based) explanations for the observed behaviours of others, while under-valuing situational explanations for those behaviours. For example, *self-serving bias* occurs when people attribute their successes to internal/personal factors but attribute their failures to situational factors beyond their control. Miller and Ross (1975) Self-serving biases in the attribution of causality: Fact or fiction? *Psychological Bulletin* 82:213-225. Ross (1977) The intuitive psychologist and his shortcomings: Distortions in the attribution process. In Berkowitz (ed.) *Advances in experimental social psychology* 10:173–220. New York: Academic Press.

[86] Hastorf and Cantril (1954) They saw a game: a case study. *Journal of Abnormal Psychology* 49:129-134.

[87] The main theory explaining the motivations behind in-group biases is *social identity theory*, which suggests that these biases protect high in-group status, thus providing a positive social identity for group members and satisfying their need for positive self-esteem. Tajfel and Turner (1979) An integrative theory of intergroup conflict. In *The Social Psychology of Intergroup Relations*, ed. Austin and Worchel, pp. 33–47. Monterey, CA: Brooks/Cole.

[92] Festinger's (1957) *cognitive dissonance theory* says that if people experience a disjuncture between their attitudes and their behaviour, they change their attitudes so they are consistent with their behaviour. Thus, smokers who know that their habit causes lung cancer will justify it to themselves as a way to stay thin or relieve stress. Similarly, Bem's (1967) *self-perception theory* proposes that we form our attitudes, opinions, and other internal states by observing our behaviour and concluding what attitudes must have caused them. Bem (1967) Self-perception: An alternative interpretation of cognitive dissonance phenomena. *Psychological Review* 74:183–200.

[135] Davis (2007) Southwark leads way on litter louts. *Evening Standard,* 17th October.

[136] Defra (2006) *Fixed Penalty Notices*, p.6.

[137] Despite the concern about litter in the Keep Britain Tidy survey, 42% of respondents admitted to having dropped litter at some point. Keep Britain Tidy (2009), p.22.

[138] In psychological terms, the costumes and performances make the issue of litter and FPN more 'available' in the mind. Availability has great power over how we think – for example, people tend to overestimate the risk of dangers that come easily to mind (for example, plane crashes) and underestimate the dangers of those that are less obvious (for example, sun-beds). For a brief description, see Thaler and Sunstein (2008), pp.27-8.

[249] Thaler and Sunstein (2008), pp.81-3.

[250] Social Market Foundation (2006) *Creatures of Habit? The Art of Behavioural Change*, p.8.

[251] The philosopher Harry Frankfurt makes a useful distinction between 'first order' and 'second order' desires. First order wishes concern a person's contingent actions (behaving in a certain way), while second-order wishes are about primary (wishes to wish to do or not to do something). Frankfurt (1971) Freedom of the will and the concept of a person. *Journal of Philosophy* 68:5-22.

[252] Most famously, Sir Isaiah Berlin argued against this way of thinking in his 1958 essay 'Two Types of Liberty', in Berlin (2002) *Liberty*. Oxford University Press.

[253] Swift (2007) *Political Philosophy: A beginner's guide for students and politicians*, p.84.

[254] We are referring to the controversy that ensues when people consider whether the use of a particular effect is justified, not whether the use of an effect increases or reduces controversy. For example, a behaviour change that uses Messenger effects may reduce controversy by recognising that we may listen more to a message from our GP than from the Secretary of State for Health. But people may consider the "use" of their GP in this way to be unacceptable and controversial.

[255] This viewpoint is underpinned by a long tradition of "social contract" thinking. See Boucher and Kelly (1994) *The Social Contract from Hobbes to Rawls*. Routledge.

[256] Dean (2009) *Governmentality: Power and Rule in Modern Society*. Second Edition. Sage.

[257] Morowitz et al. (1993) Does measuring intent change behaviour? *Journal of Consumer Research* 20:46-61; Sherman (1980) On the self-erasing nature of errors of prediction. *Journal of Personality and Social Psychology* 39:340-350.

[258] Mulgan (2009) *Influencing Public Behaviour to Improve Health and Wellbeing*, p.27.

[259] There are very good reasons for rejecting any such actions out of hand, but this is not to say they would not work, if considered acceptable. See: Bargh (2006) 'What have we been priming all these years? On the development, mechanisms, and ecology of nonconscious social behavior', *European Journal of Social Psychology* 36: 147-169.

[260] IPSOS Mori. 2,019 British adults, 9 May-5 June 2008.

[261] Pensions Commission (2005) *Pensions Commission Research: Appendix D*, p.108.

[262] Ross et al. (1977) Social roles, social control, and biases in social-perception processes. *Journal of Personality and Social Psychology* 35:485-94.

[263] These 'circumstances' are different from the environmental cues we discuss elsewhere in the document. These cues act on people without their conscious knowledge; indeed, people actively resist the suggestion that their actions are being influenced.

[264] For example, a recent IPSOS MORI poll gave the public a set of factors and asked which, if any, they thought had 'the biggest impact on your chances of living a long and healthy life'. 79% selected 'Your lifestyle', 39% 'Your genes', and 35% 'Your social circumstances'. Of course, it is perfectly possible that genes and social circumstances can affect lifestyle, but it seems likely that most people saw this as an issue of personal responsibility. IPSOS MORI, 1,994 British adults, 14-21 August 2008.

[265] Donaldson et al (2008) Weighting and valuing quality adjusted life years: preliminary results from the Social Value of a QALY Project. At: http://www.haps.bham.ac.uk/publichealth/methodology/docs/publications/JH12_Donaldson_Social_Value_of_QALY_July2008.pdf

[266] Dworkin (1981). What is Equality? Part 1: Equality of Welfare. *Philosophy and Public Affairs* 10(3):185-246

[267] Sefton (2005) Give and take: public attitudes to redistribution. In Park et al. *British Social Attitudes 22nd Report*.

[268] Brown (2009) *Personal Responsibility*, pp.21-27. Brown actually gives four types, but we have conflated 'causal' and 'preventative' responsibility.

[269] It is important to distinguish between consequential and moral responsibility because sometimes it may be appropriate to criticise someone for their moral conduct but not force them to bear the consequences. Brown (2009), p.26.

[270] The philosopher Alexander Brown points out that 'collective action can be a way for large numbers of people to take personal responsibility together'. Brown (2009) *Personal Responsibility*, p.17.

[271] See, for example, Pauly (1968) The economics of moral hazard: Comment. *The American Economic Review* 58(3):531-537.

[272] Hurley (2006) *The Public Ecology of Responsibility,* p.5.

[273] Hurley (2003) *Justice, Luck, Knowledge*. Cambridge, MA: Harvard University Press.

[274] Quoted in conversation at: http://www.edge.org/3rd_culture/thaler_sendhil08/class4.html

[275] Hurley (2006) *The Public Ecology of Responsibility*, p.15.

[276] There is a large body of research which suggests the presence of automatic effects that discriminate against racial minorities – whether or not the person being tested is themselves a member of an ethnic minority or consciously holds discriminatory attitudes. For an overview of the evidence, see Payne and Cameron (2010). Divided minds, divided morals: How implicit social cognition underpins and undermines our sense of social justice. In Gawronski and Payne (eds.) *Handbook of Implicit Social Cognition: Measurement, Theory,*

and Applications. New York, NY: Guilford Press. At: http://www.unc.edu/~bkpayne/publications/PayneCameron.pdf

Foreword

We need to encourage positive behaviour change

Tackling some of society's most intractable and costly problems most often requires us to change behaviours in some way. Some steps may be small, like turning off lights, and others may be large, like changing our diets. Some behaviours can have tragic short-term consequences, like driving too fast, and others longer-term damage to ourselves and other people, like smoking.

What they have in common are the personal, social and economic costs to us as citizens and taxpayers. Money and resources spent, for example, on treating obesity is not just a cost but also a lost opportunity to invest in other areas of civil society.

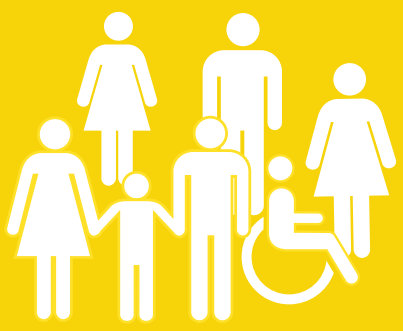
So, increasingly, the success of many government policies and priorities depends on our achieving behaviour change with the greatest effectiveness and efficiency.

But, as this document makes clear and our experience has shown, behaviour change is a complex area. If we are to succeed, we need to understand the theories underpinning behaviour change and how marketing and communication can aid policy formulation and ensure effective delivery.

Government has a number of tools at its disposal to stimulate behaviour change, from legislation, regulation and taxation to providing information, persuasion, engagement and working in partnership. In most cases, putting these tools into action will require communications in some form.

Within government, we are continually seeking new and better ways to communicate with citizens to encourage positive behaviour change. With this document, we hope to provide those working in government communications with an update on some of the latest thinking about what drives human behaviour and to launch the debate as to what this means for our approach to communications, from strategy development through to evaluation. We see this as the first stage in an ongoing dialogue.

There are already many examples across government where the theories and principles outlined below have been used to develop effective communication and marketing strategies. We have drawn on these examples and included some of them as case studies, from which we can all learn.



I hope you find this a useful resource. We look forward to working with you to continue developing and delivering communications that are informed by both a deep understanding of the behaviour we seek to influence and the rapidly changing communications landscape.

Mark Lund, Chief Executive, COI

Introduction

Human behaviour is a very complex area. This document draws on key sources from the disciplines of social psychology, economics and behavioural economics (where the first two disciplines overlap). We have sought to distil this information into some key factors that are important to consider for anyone developing communications that seek to influence behaviour, and to develop a framework for applying these factors to the development of a communications strategy.

About this document

The document is designed primarily for those working in government communications and draws on the Government Social Research (GSR) *Behaviour Change Knowledge Review.*[1] The GSR Review was developed primarily for those in analysis, research and policy roles. It is therefore important that this document covers the same key theories and principles, so that those working across all types of behaviour change interventions can develop a common understanding.

Broadly speaking, most government communications seek to encourage or enable people to act in one or more of the following ways:

- to **start** or adopt a new behaviour;
- to **stop** doing something damaging;
- to **prevent** the adoption of a negative or harmful behaviour; and/or
- to **change or modify** an existing behaviour.

In each case, the aim is to get people to behave in a certain way. Insights from social psychological theory and behavioural economics, both of which provide us with a deeper understanding of human behaviour, are therefore relevant to all government communications.

A brief introduction to some key behavioural theory disciplines

Many disciplines have something to say about human behaviour, including economics, psychology, sociology and anthropology. Within government, 'behaviour change' (which is often applied through social marketing campaigns) tends to be dominated by social psychological and (behavioural) economics thinking.

Behavioural models are designed to help us better understand behaviour. Those used within government tend to be social psychological models that explain behaviour by highlighting the underlying factors influencing the individual or group. Behavioural economics combines insights from economics and psychology to generate principles that show how people's decision-making can be less 'rational'.

Over recent years, behavioural economics has attracted much interest, with authors such as Richard Thaler and Cass Sunstein[2] exploring some of the principles and looking at how these can be used to 'nudge' us towards making 'better' decisions.

1 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

2 Thaler R and Sunstein C (2008), *Nudge: Improving Decisions About Health, Wealth and Happiness,* Yale University Press, New Haven, Connecticut.

While behavioural models and economics both seek to explain why people behave the way they do, theories of change seek to explain how behaviour changes. There are many theories of behaviour change, drawn from a wide range of disciplines. This document discusses a few of the most commonly cited theories.

We have provided an overview of some of the main factors from social psychological models, the key principles of behavioural economics and the best-known theories of change. For a more in-depth discussion, see the GSR Review,[3] which covers over 60 social psychological behavioural models and theories and includes an appendix that matches behaviour types or domains (for example environment, health or transport) to models. You may find this a helpful starting point in identifying those models that are relevant to you and warrant further exploration.

Within some government departments and agencies, teams (usually either policy or analysis) have already undertaken significant research into behavioural models and theories relevant to their policies. It is therefore well worth investigating whether any work has already been carried out in your department or agency before starting your own exploration.

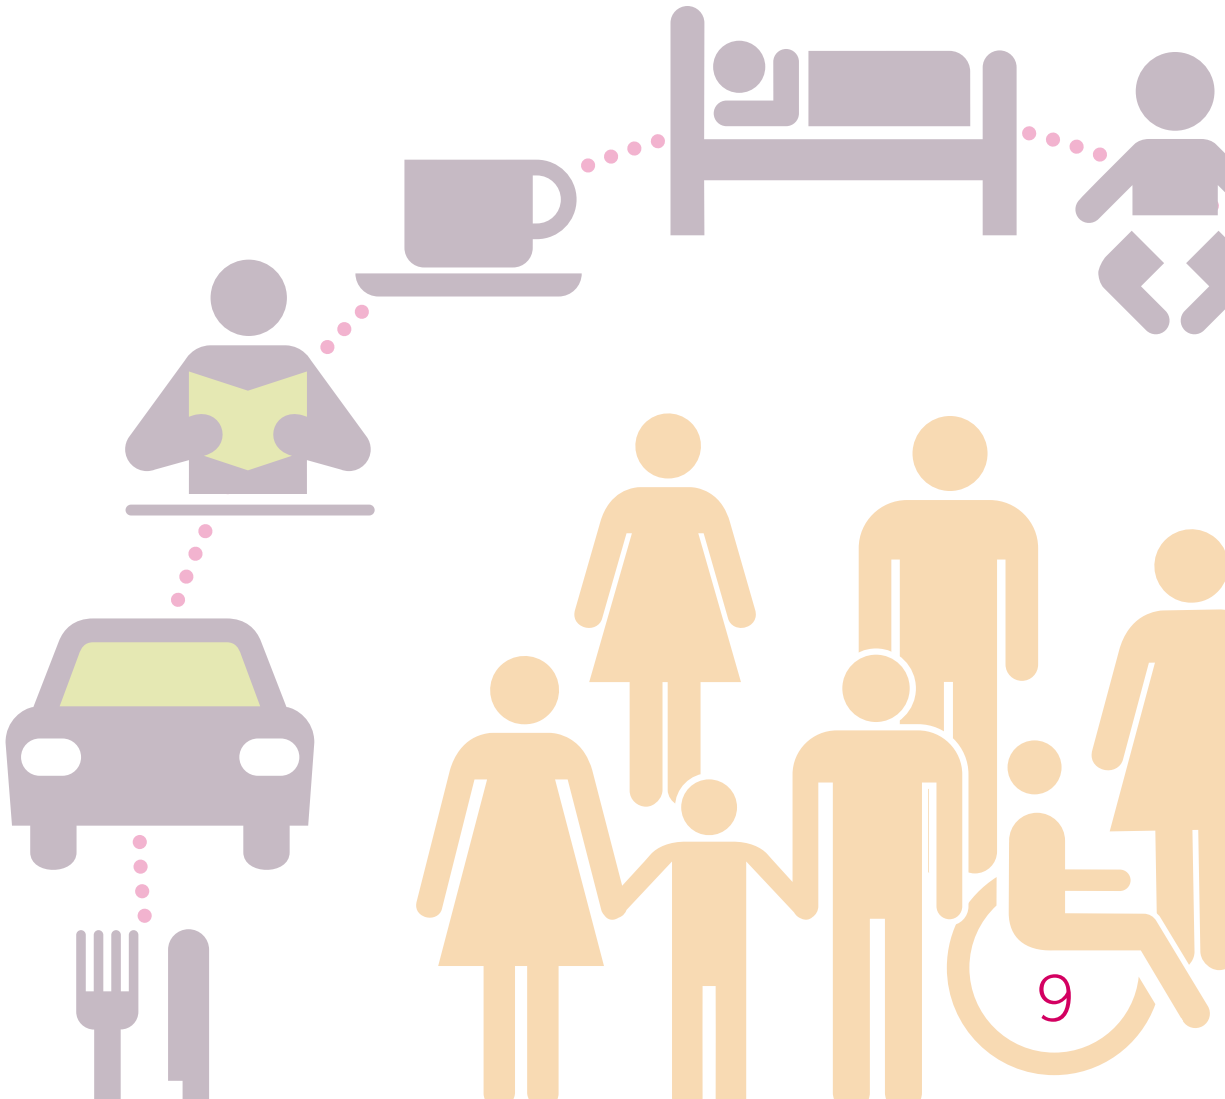
In this document

What influences people's behaviour?

This section outlines some of the key factors that influence behaviour. It draws on a range of social psychological theories and includes three examples of behavioural models. The section also gives an overview of the key principles of behavioural economics and of the best-known theories of change. Case studies provide a practical illustration of how models and theories have been used to inform government communications.

Embedding behavioural theory

A five-step framework shows how, by increasing our understanding of behaviour, behavioural theory can help to define the role for communications and build a communications model. The Department of Health's Tobacco Control campaign is used to show how each step of the process might work in practice. The section concludes with a summary of the steps and a series of questions designed to stimulate thinking at each stage.



3 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

Conclusions and future implications

This section lists the main conclusions emerging from the report, then goes on to consider some of the key implications for communicators.

Next steps

Finally, this section suggests some areas for future discussion aimed at embedding behaviour change theory in communications development.

What influences people's behaviour?

Human behaviour is influenced by a huge range of factors. In this section, we seek to distil the ever-increasing body of evidence about why we do what we do into some key factors and principles that are important to consider when designing communications aimed at influencing behaviour change.

'Individual behaviours are deeply embedded in social and institutional contexts. We are guided as much by what others around us say and do, and by the "rules of the game" as we are by personal choice.'[4]

Social psychological models of behaviour

There are many different social psychological models that seek to explain human behaviours. Broadly speaking, the factors in most of them can be split into three levels:

1. Personal ('micro') factors which are intrinsic to the individual, such as their level of knowledge or their belief in their ability to change their behaviour and their habits.

2. Social ('meso') factors which are concerned with how individuals relate to each other and the influence of other people on their behaviour.

3. Environmental factors over which individuals have little control. These include both:

   a. local ('exo') environmental factors, for example the area in which an individual lives and local shops and facilities, and

   b. wider ('macro') environmental factors such as the economy or technology.

Most models tend to focus on factors at the personal and social levels, with few explicitly referencing those at the environmental level. It is, however, essential to consider factors from all three levels. For this reason, we suggest that social psychological models are used primarily to identify personal and social factors and that additional work (see the discussion of systems mapping, page 13) is undertaken to identify the relevant external factors.

There are a number of reasons why it is so important to identify factors at all three levels. Seeking to understand and influence behaviour by addressing personal factors alone, for example, is unlikely to work, because it fails to take into account the complex and interrelated nature of the factors that influence what we do: we do not act in isolation, and most people are influenced to a very great extent by the people around them and the environment in which they live. Equally, it would be overly simplistic to focus on environmental factors, such as access to services or levels of taxation, while ignoring the social and personal factors at play.

In seeking to influence behaviour in the context of health, for example, it is generally accepted that an **ecological** approach – that is, one that identifies and addresses the factors influencing behaviour at all three levels – is likely to be most effective at bringing about behaviour change.

4 Jackson T (2005), *Motivating Sustainable Consumption: A Review of Evidence on Consumer Behaviour and Behavioural Change,* report to the Sustainable Development Research Network, London.

Key learnings

- It is essential to identify factors influencing behaviour at the personal, social and environmental levels.
- An 'ecological' approach – one that takes account of and addresses factors at all three levels – is likely to be most effective in bringing about behaviour change.

A note about behavioural models

While models can help us understand more about human behaviour, they do have some limitations:

- Models are deliberately simplified to aid understanding, and 'do not account for all the complexities of behaviour'.[5]
- Most models do not segment the target population. In reality, different factors are likely to carry different weight for different people.
- Models are usually based on data from a specific audience and/or designed with a specific behaviour in mind and may not 'travel' well. Any model used must be explored for relevance to the behaviour that is being addressed.

It is also important to note that behavioural models and theoretical insights are not a substitute for primary research. Our aim is to help you incorporate theory into your planning alongside primary research and other evidence.

5 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses,* HMT Publishing Unit, London.

Behavioural models and communications

Understanding all the factors that influence the behaviour you want to change is an essential starting point. It will enable you to start identifying the most effective interventions and to establish where communications (in the broadest sense) sit within the mix.

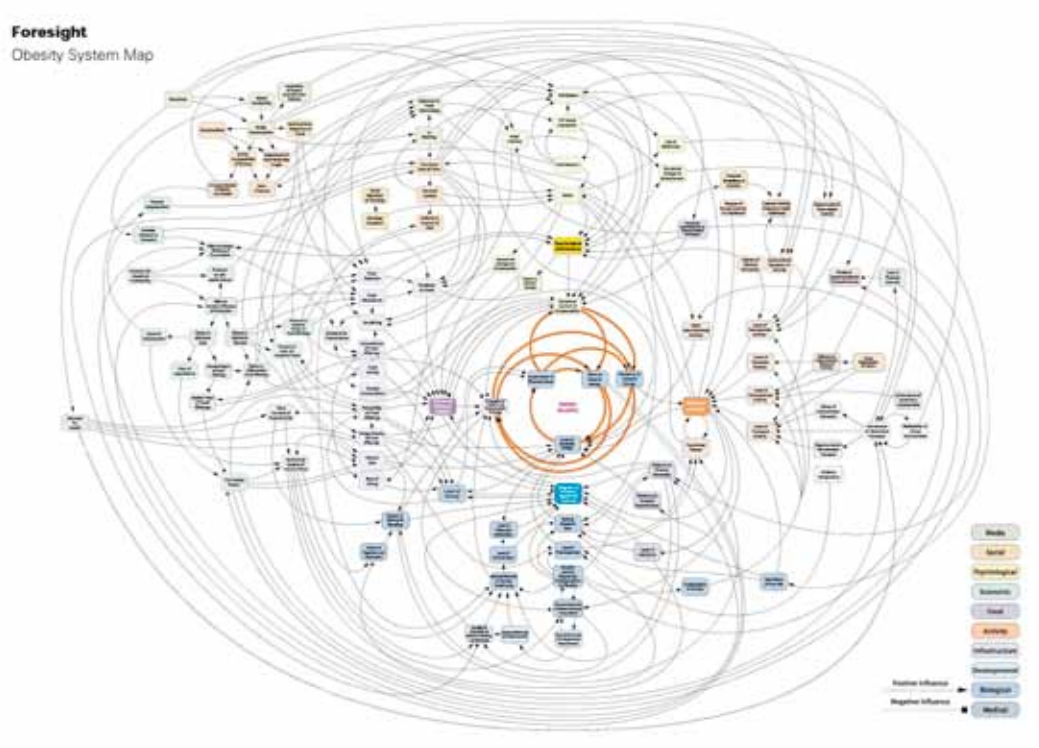
The approach outlined in this section is aligned with the early steps in the nine principles for developing interventions using behavioural models outlined in the practical guide section of the GSR Review.[6] This is to ensure that policy and communications teams share a consistent framework.

Identifying behaviours

Some government communications focus on influencing a single behaviour, such as getting people to drive more slowly. For many issues, though – for example, climate change and obesity – government will need to bring about changes in multiple behaviours in order to meet policy goals.

Where the specific behaviour or behaviours in question have already been identified and agreed, you can move straight on to identifying the influencing factors (see page 15). If, however, this thinking has not yet been done, it is important to identify all the relevant behaviours and other factors contributing to the issue you are seeking to address. Otherwise, it will not be possible to select the appropriate behavioural model(s).

The most complex behaviours may require a systems thinking approach. **Systems thinking** is a way of mapping out all the factors influencing a particular issue and the relationships between them, so that issues can be seen as part of an overall system rather than in isolation. **Systems diagrams** provide a visual representation. At the core of systems thinking is the concept of **feedback**, the idea that changing one factor will often affect one or more of the other factors within the system. It is therefore particularly useful in helping to anticipate the possible consequences of interventions aimed at a specific factor or factors. While it may not be communications teams who undertake systems mapping, such exercises can nevertheless yield valuable insights into the range of interventions needed to address the various factors and the part that communications can play in the mix.



Where the issues involved are less complex, a full systems mapping exercise may not be needed. However, an exercise to identify the factors and behaviours contributing to the issue you are seeking to address will provide a useful starting point in developing a comprehensive picture of influences.

Mapping the causes of obesity

Obesity is a complex issue with extremely wide-ranging causes operating at the personal, social and environmental levels.

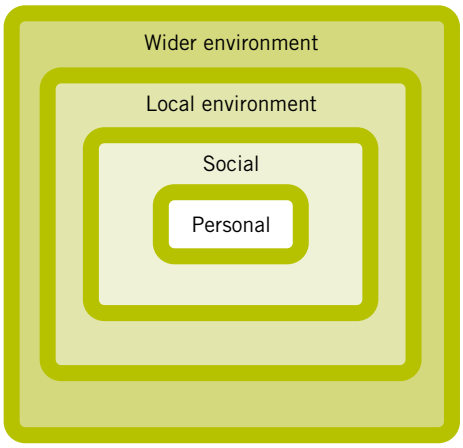
In the absence of a model incorporating all the relevant factors, a team of experts from a range of disciplines, including psychology, sociology, food sciences, genetics and epidemiology, produced an Obesity System Map highlighting the full range of contributory causes.[7]

The Obesity System Map shows a vast number of factors operating at the personal, social and environmental levels with multiple linkages and no one factor dominating. This clearly points to the need for a sustained and wide-ranging programme of interventions in order to facilitate change.

7 Vandenbroeck P, Goossens J and Clemens M (2007), T*ackling Obesities: Future Choices – Building the Obesity System Map*, Government Office for Science, London.

Understanding the factors that influence behaviour

The factors that influence behaviour fall into the following broad levels: personal; social; local environment; and wider environment.



This section provides an overview of factors at all levels that can play a major role in influencing behaviour. It does not and cannot cover all the factors that influence behaviour. Instead, we have chosen to focus on those that appear across a number of different behavioural models and/or that we believe are particularly important to consider when designing communications aimed at influencing behaviour change.

The section also includes three examples of behavioural models to show how the factors selected work in context.

Personal factors

Knowledge and awareness

When we ask people to change their behaviour, we need to clearly set out our expectations. This might be, for example, the speed limit we want them to observe when driving in a built-up area. Standard economic theory assumes that if people are provided with information, they will act on it in such a way as to maximise personal benefit and minimise their costs, a concept often referred to as 'rational choice theory'.

The AIDA (Attention, Interest, Desire, Action) marketing model is an example of an 'information deficit' model. It is based on the idea that providing information will spark interest, which in turn leads to desire and subsequently to action.

Sometimes – for example, when telling people how to deal with swine flu or about a new piece of legislation – it is appropriate simply to give them the relevant information. But **knowledge and awareness** are rarely enough by themselves to bring about behaviour change. Other factors can override our 'rational' selves, and we may make systematic errors in our rational calculations (see the section on behavioural economics, page 20).

Providing information is therefore a first step towards influencing behaviour change rather than an end point. For example, as well as explaining how eating too much and doing too little can lead to obesity, the Change4Life campaign (see case study on pages 28–29) also aims to increase self-efficacy (see page 18) by showing people that they can incorporate more activity into their daily lives. Information can also be used to direct people to other communication channels or services – such as a website – that aim more directly at changing behaviour.

Attitudes

Attitudes are specific to particular behaviours. Early psychological models show attitudes leading to intention in a predominantly linear fashion. In later models, attitude still plays a role but appears alongside a range of other factors.

While attitudes can influence behaviour, evidence now suggests that the link is not as strong as we might previously have thought. The so-called 'Value Action Gap'describes those situations where a person holds values that are inconsistent with their behaviour.

The Value Action Gap can be particularly evident with regard to attitudes to the environment. While people may believe that it is important to protect the environment, other factors may take precedence when it comes to actually changing their behaviour. Darnton cites research into pro-environmental behaviours which found that at least 80 per cent of the factors influencing behaviour did **not** stem from knowledge or awareness.[9] It is also important to bear in mind that although attitudes can precede behaviour, the opposite can also be true.

According to Festinger's theory of cognitive dissonance,[8] a person holding two inconsistent views will feel a sense of internal conflict ('cognitive dissonance'), which will prompt them to change their views and so bring their perceptions into line. This has also been found to apply to inconsistencies between perceptions and behaviours.

A good example of cognitive dissonance is evident among smokers. Most smokers know that smoking causes lung cancer and other health problems, but they also want to live a long and healthy life. Smokers can seek to reduce this 'dissonance' either by giving up smoking or by finding ways to justify their habit, for example by claiming that cigarettes keep them slim or that they know someone who smoked 30 cigarettes a day and lived to be 100.

8 Festinger L (1957), *A theory of cognitive dissonance,* Stanford University Press, Palo Alto, California.

9 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

Communications can help to shift attitudes. For example, government campaigns have succeeded in changing attitudes to drink driving and this, combined with legislative change and other interventions, has succeeded in bringing about behaviour change (see the case study on page 19). However, as with **knowledge and awareness**, shifting attitudes alone may not be enough to bring about behaviour change. It is therefore rarely advisable to view attitude shift as a precursor to behaviour change, or to use it as a proxy for behaviour change for the purposes of evaluation.

Habit and routine

Habit or **routine** can be a key factor in influencing frequent behaviours. In recent years, it has become an emerging area of study in social psychology and in fields such as neuroscience. Here, experiments on animals have given insights into the dual process cognitive system[10] whereby the automatic mind handles most of our day-to-day functioning while the executive mind both monitors the automatic mind and takes on focused mental tasks.

The more we repeat a particular behaviour, the more automatic it becomes. As time passes and the behaviour is undertaken more and more frequently, habit can therefore become the key factor driving behaviour. As government communicators, many of the behaviours we try to influence will be habitual (for example, leaving appliances on standby or having the tap running while we brush our teeth). Such behaviours are often unconscious, and difficult to explain or justify.

Kurt Lewin's theories of change maintained that breaking habits required an 'emotional stir-up'[11] to raise the habit to conscious scrutiny. Smoking is both an addictive and a habitual behaviour. The British Heart Foundation's Fatty Cigarette campaign set out to tackle the habitual element by associating the cigarette with the damage it was doing. The aim was to ensure that each time the smoker thought about having a cigarette, they would also think about the damage it caused. This constituted the 'emotional stir-up' needed to turn smoking from an unconscious habit into a conscious action.

10 Graybiel (2008), 'Habits, rituals, and the evaluative brain' in *Annual Review of Neuroscience* vol 31, 359–87.

11 Lewin K (1951), *Field Theory in Social Science*, Social Science Paperbacks, London.

A number of behaviour change theories stress the importance of subjecting habits to scrutiny as a first step towards changing them, by raising them out of the unconscious mind. Communications designed to influence habitual behaviours must therefore look at which strategies will be most effective in turning a habit into a conscious behaviour. Ambient media used at the point where the behaviour actually takes place is an example of communications seeking to do this and can be very effective – for example, posters and stickers near washbasins reminding people to wash their hands, as used in the swine flu campaign.

Self-efficacy

Agency, **self-efficacy** and **perceived behavioural control** (different terms are used in different models) all describe 'an individual's sense that they can carry out a particular action successfully and that action will bring about the expected outcome'.[12] What is important is the belief, not whether or not the individual is actually capable of achieving a particular goal. This will determine the effort a person is prepared to put into changing their behaviour and even whether they will attempt it at all. People's sense of agency can be driven by many things, including past experiences and personal beliefs (for example, some people are naturally more pessimistic than others).

This factor appears in many social psychological models. Lack of agency can be a strong barrier to behavioural change. Again, environmental issues are a useful example. 'Public responses to climate change are commonly characterised by a lack of agency, for instance, the sense that the problem is too large for individuals to make a difference.'[13]

Communications can help to increase individuals' sense of agency, for instance by providing clear instructions that make a particular behaviour seem more achievable, by using testimonials to show how other people have made the change or by helping to teach relevant skills. For example, one element of a recent sexual health campaign set out to teach young people negotiation skills which they could then use to initiate discussions about, for example, contraception. A further exmple of a campaign seeking to increase 'agency' is the Home Office vehicle crime campaign (see page 20). However, it is essential that any such communications are seen as trusted and credible and that the behaviour is depicted as achievable.

13 Ibid.

Moment of Doubt campaign

The Department for Transport's Moment of Doubt campaign aims to convince young men aged between 17 and 29 that the consequences of drink driving are relevant to them.

In the past, drink-driving campaign messages have been based on a risk and reward model, contrasting the pleasure of drinking with the risk of causing injury or death by driving under the influence. While the number of people killed has fallen from 1,600 in 1979, it has stayed relatively stable at above 500 a year since 2000.

The advertising agency, Leo Burnett, set out to re-evaluate the assumptions behind the campaign. Attitudinal research found that a small but growing number of people, particularly men aged 17–29, refused to acknowledge the risk of having a crash when driving after drinking, while qualitative research suggested that trying to shock viewers with the most extreme consequences was becoming less effective for this group, who did not see drink drive-related crashes as relevant to them.

From general attitude to personal response

These findings, along with input from behavioural psychologists, pointed to a move away from campaigns that build public outrage towards persuading the target audience that drink driving could have immediate, negative consequences for them personally.

Consumer research, a semiotics analysis and behaviour theory identified the key intervention point as occurring when the drinker was deciding whether to have a second pint, ie when they were still in control. The campaign therefore focused on creating **cognitive dissonance** (see page 16) between the desire for another drink and a set of credible, relevant consequences such as getting a criminal record, being banned from driving and damaging relationships with a partner or family members.

Impact

Six months after the launch of the campaign, young men's perception that they would be caught by the police had risen from 58 to 75 per cent.[14] The number of people breathalysed during December 2007 rose by 6.4 per cent, while the number testing positive fell by 19.5 per cent.[15] The number of deaths and serious injuries caused by drink driving fell for the first time in six years, from 560 in 2006 to 410 in 2007.

14 BMRB Tracking, January 2008.
15 Accociation of Chief Police Officers.

Home Office vehicle crime campaign

The Home Office vehicle crime campaign sought to increase people's sense of agency by persuading them that they could outsmart the criminals.[16]

Where previous campaigns had used images of circling hyenas to play on people's fear of crime, the strapline 'Don't give them an easy ride' aimed to empower people and convince them that through their own actions they could lessen their chances of becoming a victim. The campaign also sought to change habits by placing ads reminding people to lock their cars and not leave valuables on show in strategic places such as parking meters and petrol pumps where opportunistic theft was most likely to happen.

Emotion

Emotions may be triggered without our knowing and can have a strong influence on our behaviour, both conscious and unconscious. While most models see emotion as influencing behaviour change indirectly (by altering attitude, habit or agency), there are occasionally situations where behaviour is driven by emotion alone. For example, a phobia or fear can determine how an individual behaves in certain situations.[17]

Where communications do aim to stimulate emotion, it is important to understand which factors are likely to be affected by the emotional response, given that often, emotion will not have a direct influence on behaviour. Emotion can be a useful 'hook' but it should not be the end point. Otherwise, there is a risk that the communication will not lead to any change in behaviour, as in the Home Office's original vehicle crime campaign (see box), where images of hyenas circling a car inspired fear in some sectors of the audience and left them feeling powerless.

Behavioural economics

In the previous section, we looked at some of the most common factors that drive behaviour at the personal level. These all appear in social psychological models. Behavioural economics can also be used to understand individual behaviour.

16 COI/IPA (2008), *How Public Service Advertising Works,* World Advertising Research Centre, London.

17 Darnton A (2008), ***GSR Behaviour Change Knowledge Review.*** *Reference Report: An overview of behaviour change models and their uses,* HMT Publishing Unit, London.

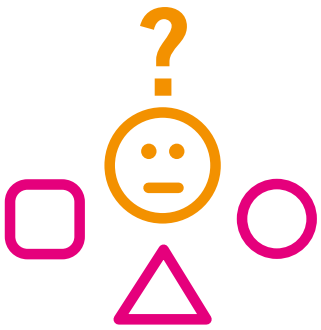
Behavioural economics involves applying psychological insights to economic models to account for the systematic 'errors' in our decision-making. It suggests that the decisions we make are dependent on context and that natural **biases** and **mental shortcuts (heuristics)** can lead to 'imperfect' decision-making. Behavioural economics does not generate 'drivers', but it does offer principles that can help us understand why people deviate from the assumed 'rational' standard. Communicators seeking to influence behaviour in a way that involves making a decision or choice should therefore have an understanding of those principles.

Mental shortcuts (heuristics)

We take 'mental shortcuts' or use 'rules of thumb' hundreds of times each day, and the more pressure we are under, the more shortcuts we take. Where, for instance, we don't have time to make a decision by calculating the pros and cons of various options, we often make an 'educated guess' based on, for example:

- **How easily we can recall (availability) or imagine (simulation) something happening:** We tend to believe that events we can easily think of or imagine happen more often and are consequently more likely to happen to us.
  '... people tend to be more nervous about flying than driving because airplane crashes are easy to recall. Similarly, it is found that the larger the jackpot in a lottery, the more tickets that are bought, because the consequences of a large prize attract more attention and are easy to imagine.'[18]
  Communications can harness this bias by making it easier for people to imagine the consequences of a particular behaviour or reminding them of the (negative) consequences of a past action.
- **What has happened before (representativeness):** We generally make decisions based on how similar an outcome is to something that has happened before, not by weighing up all the possibilities.

  'The heart of the gambler's fallacy is the misconception of the fairness of the laws of chance. The gambler feels that the fairness of the coin entitles him to expect that any deviation in one direction will be cancelled out by a corresponding deviation in the other … This fallacy is not unique to gamblers'.[19]



Biases

Internal biases mean that our natural responses are not always fully 'rational'. Recognising this can help us understand why people make the choices they do in the 'real world' and identify whether there is a role for communications in overcoming these biases, some of which are discussed here.

We tend to prioritise short-term reward over long-term gain (hyperbolic discounting). For example, some people prefer to have more money now than to pay into a pension plan. This is an important principle for government communicators, as government is often seeking to persuade people to make choices that involve a long-term pay-off but little immediate gain.

18 Halpern D, Bates C, Geales B and Heathfield A (2004), *Personal Responsibility and Changing Behaviour: the state of knowledge and its implications for public policy,* Prime Minister's Strategy Unit, Cabinet Office, London.

19 Kahneman D, Slovic P and Tvesrsky A (1974), Judgement Under Uncertainty: Heuristics and Biases' in *Science* vol 185 No. 4157, 1124–31.

Cass Sunstein and Richard Thaler in *Nudge: Improving Decisions About Health, Wealth and Happiness*[20] use the term 'choice architecture' to describe how decisions can be influenced by the way in which they are framed. They argue that the 'choice architect' can 'nudge' people towards 'better' choices without compromising individual freedom.

This concept is particularly relevant to communications and central to the aims of many communications strategies, suggesting as it does that the way choices are framed can make them more effective.

The extent to which we disregard future gain (the 'discount rate') will increase the more remote the issue appears to be. So, generally speaking, the younger the person, the less likely they are to prioritise investing in a pension plan. Disadvantaged groups also tend to be more likely to discount future gain, focusing instead on getting by in the short term.

'... policies that are based on individuals' investment in their future (eg personal pensions, adult education) have a tendency to widen inequalities as those with high discount rates will be less likely to take on these opportunities.'[21]

We're loss-averse. We tend to put more effort into avoiding loss than ensuring gain. Evidence suggests that communications focusing on potential losses rather than gains are more motivating: in other words, disincentives are more effective than incentives. According to this principle, a message that states 'You will lose £X each year if you don't insulate your loft' will have more impact than one that states 'You will save £X each year if you do insulate your loft'.

We have a natural preference for the status quo (inertia). When faced with a difficult or complex choice, our tendency is to carry on doing what we've always done and avoid making a decision.

In recent years, there has been much discussion about how government can harness the power of inertia by adjusting society's 'default' settings, for example by requiring people to opt out

20 Thaler R and Sunstein C (2008), *Nudge: Improving Decisions About Health, Wealth and Happiness,* Yale University Press, New Haven, Connecticut.

21 Halpern D, Bates C, Geales B and Heathfield A (2004), *Personal Responsibility and Changing Behaviour: the state of knowledge and its implications for public policy,* Prime Minister's Strategy Unit, Cabinet Office, London.

of becoming organ donors or making pension contributions something to opt out of rather than opt in to. Indeed, in the case of pensions this is already happening: from 2012, all employers will have to automatically enrol their eligible employees into a good quality workplace pension scheme and provide a minimum contribution unless the employee chooses to opt out.

Such decisions tend to be taken by policy teams (although communications may have a part to play both in helping to develop the policy and in getting messages out to the relevant audiences). But where this approach is not possible, communicators should give some thought to strategies for overcoming inertia, for example by making the behaviour seem easier to undertake than people perceive it to be.

Choices are influenced by the way they are presented (framing). As the discussion of biases demonstrates, many of the choices we make are hugely influenced by how they are presented to us or how they are framed.

Key learnings

- Understanding the natural biases and mental shortcuts that shape people's thinking should inform the nature and content of communications.

Social factors

'… an extremely important task during the formative stages of the strategic planning process is to gain an understanding of the extent to which interpersonal influences are likely to be important for one or more target groups.[22]

Other people's values, attitudes, beliefs and behaviour can have a strong **social influence** on our own behaviour, a phenomenon that has been widely discussed in recent years.

Social norms are the group 'rules' that determine what is deemed 'acceptable' behaviour. Social norms can have a huge influence on our thoughts and behaviours and therefore appear in many different social psychological models. Social norms vary by group, so what the norm is for one group of young people may well be different from that adopted by another group living in different circumstances. Failure to act in accordance with these 'rules' can lead to exclusion from the group.

When we are unsure of how to act in social situations we often assume that others around us know more and look to them for pointers on how to behave, a phenomenon known as **social proof**. An example of this would be a party where food is laid out but guests are unsure whether it's acceptable to help themselves. As soon as the first person helps themselves, others will quickly follow: the behaviour has been shown to be acceptable to the group.

22 Andreasen A (1995), *Marketing social change: Changing behaviour to promote health, social development and the environment,* Jossey-Bass, San Francisco.

We tend to underestimate the extent to which we are influenced by others. Most people will deny any influence at all, an important factor to consider, particularly for researchers. Direct questioning alone is unlikely to be the best way of establishing the influence of social norms on an individual.

Communications and social norms

Communications can be effective in highlighting social norms and prompting people to act in accordance with them. An experiment involving hotel guests provides an illustration.[23] Half the guests had signs in their bathrooms with a message about how reusing towels could benefit the environment. The other half had the same sign but with an extra message stating that most hotel guests reused their towels at least once during their stay. Guests exposed to the additional message were 26 per cent more likely to reuse their towels: a clear demonstration of the power of social proof.

Further examples of how communications can utilise the power of social norms include:

- peer-to-peer approaches such as online forums or communities where people can connect to others in similar circumstances. This can be particularly helpful with regard to less common or more sensitive issues, as social proof and reassurance can be provided in a 'safe' and anonymous way;
- positive testimonials from others who have used a service or adopted a particular behaviour (thus showing that such behaviours are acceptable). Note that testimonials can also help to boost self-efficacy (see page 18);
- targeting campaigns at respected, authoritative opinion leaders or recruiting them as 'ambassadors' for a brand or behaviour. These people can help both to spread the message and to provide social proof of the acceptability of a particular behaviour; and
- driving word of mouth, for example by using PR techniques to generate news stories that describe other people behaving in a particular way.

Social norms can be particularly strong in relation to some of the most intractable behaviours that government is seeking to change. For example, if the norm within a peer group is to go out and drink to excess, it is unlikely that lasting behaviour change will be achieved unless that norm is addressed. For the young people in that group, the views and behaviour of their peers will be a more powerful influence than information provided by other sources.

Descriptive and injunctive norms

The social pyschologist Robert Cialdini distinguishes between two types of social norm: 'descriptive norms' and 'injunctive norms'.[24] Descriptive norms fit the description of social norms set out above: that is, we base our own behaviour on how other people act. Injunctive

23 Goldstein N, Martin S and Cialdini R (2007), *Yes! 50 Secrets from the Science of Persuasion,* Profile, London.

24 Cialdini R, Kallgren C and Reno R (1991), 'A Focus Theory of Normative Conduct: a theoretical refinement and re-evaluation of the role of norms in human behaviour' in *Advances in Experimental Social Psychology* vol 24, 201–34.

norms are the rules and regulations that tell us what we should do. Often, the two types of norm align but sometimes, as in Tim Jackson's motorway driving example (see right), this is not the case.

The risk of unintended consequences

Communicators must be aware of the risk of making the behaviour they are seeking to change seem as if it is widespread and therefore acceptable. For example, in seeking to highlight the problem of missed appointments, hospitals and GP surgeries will often cite the number of people that fail to turn up. It has been argued that this approach runs the risk of inadvertently legitimising the behaviour – other people are doing it, so why shouldn't I? An alternative would therefore be to focus instead on the fact that the vast majority of people do turn up on time.

Similarly, it has been argued that raising awareness, particularly of risky health behaviours such as heavy drinking or drug taking, may serve to exacerbate the problem. Research in the US into the different approaches taken by colleges to try to reduce alcohol consumption found that most campaigns highlighted the 'descriptive norm', that is the high consumption of alcohol. Through the use of trial communications, the team found that such messages could actually encourage those students who drank less than the amount described to increase their consumption to the level presented as the norm.[25]

'Tim Jackson gives the example of motorway driving (Jackson 2005): if other drivers around him are driving over the speed limit, he may be likely to do the same (following the descriptive not the injunctive norm). If he sees a police car up ahead, he is likely to reduce his speed; the police car performs a focusing function, making the injunctive norm salient. The police car also provides an element of 'surveillance', the sense of foreboding that sanctions may be imposed which is a requirement for adherence to injunctive norms. The focusing function is also required in activating descriptive norms.'[26]

25 Schultz PW, Nolan JM, Cialdini RB, Goldstein NJ and Griskevicius V (2007) 'The Constructive, Destructive, and Reconstructive Power of Social Norms', in *Psychological Science*, vol 18 No. 5, 429–34.

26 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

While there are instances of social norms changing rapidly, this has often been as a result of legislative change, for example the ban on smoking in public (smoking had already become less acceptable, but the ban made it even more so). More commonly, social norms change slowly, and therefore, in the absence of legislative change, a long-term approach will be required as it will take time for any changes to filter through and become commonplace in society. In other words, a short burst of communications activity alone is unlikely to be effective in shifting a social norm.

Environmental factors

In order to understand why people behave in the way they do, it is essential to take into account the physical conditions and environment in which they live.

Environmental factors can be hugely significant in determining how an individual will behave. Before behaviour change can occur, the right 'facilitating conditions'[27] must be in place in both the individual's local (exo) environment and the wider (macro) environment.

The local (exo) environment

However motivated we are to behave in a certain way, if our local environment puts barriers in the way of that behaviour it is unlikely that we will succeed. For example, an individual may be strongly motivated to use public transport instead of a car, but if there is little access to public transport in their area, it will be difficult if not impossible for them to change their behaviour.

Another example is recycling. Before kerbside collections became commonplace, anyone wanting to recycle needed not only the motivation to recycle but also the commitment to find a recycling facility and access to transport. To be effective, communications aimed at persuading people to recycle needed to go hand in hand with improving access to recycling facilities.

The wider (macro) environment

Factors that operate at a national or even international level can also have a huge influence on individual behaviour. Wider or **macro environmental** factors can include technology, the economy, taxation and legislation.

Most social psychological behavioural models do not make explicit reference to external factors. The Theory of Planned Behaviour (see page 31) looks at environmental factors within the context of 'perceived behavioural control', while the Theory of Interpersonal Behaviour (see page 32) considers external factors as part of 'facilitating conditions'.

Although few models reference specific environmental factors, it is essential that communicators take them fully into account. Systems mapping or similar exercises at the start of any interventions planning should identify the factors influencing behaviour at this level. Social psychological models can then be used to identify factors and plan interventions at the personal and social levels.

27 Triandis H (1977), *Interpersonal Behavior*, Brooks/Cole, Monterey, California.

The implications for communicators

Broadly speaking, factors influencing behaviour at the environmental level will often be tackled through policy or delivery interventions, for example by making changes to regulations or the provision of services. Communications nevertheless have an important role to play.

Communications can provide vital support for policy interventions, for example by providing information about new legislation (such as the reclassification of cannabis) or promoting local services. In such cases, more traditional forms of advertising may be appropriate.

Communications can also influence environmental factors by helping to frame the discourse on particular issues. While this may challenge 'traditional' definitions of the role of communications, it is an important point to consider, particularly where government is seeking to influence behaviours that are deep-seated and difficult to change.

Participative approaches such as citizens' summits, workshops or online dialogue draw on theories of learning and change which argue that sustainable change cannot be imposed. Rather, people need to play an active role in the change process. Communications could be used, for example, to recruit people into programmes that empower them to change the environment themselves or to highlight local problems, thus creating the momentum for change.

Even where hard policy levers are applied, individuals may fail to respond in a 'rational' way (see page 15). Litter penalties are one example of this. Since 2006, councils have had the power to issue fixed penalty notices to anyone dropping litter in public. However, littering remains a major problem, even in areas where those penalties are enforced. In such cases, communications can play a crucial role alongside policy interventions by seeking to persuade people to adopt or advocate a particular behaviour.

Key learnings

- We cannot rely on people to make rational decisions based on the information provided, and we cannot assume that changing attitudes will lead to a change in behaviour.
- Social factors are powerful, and social norms are deeply entrenched. Change in social norms is often slow to happen, and communications are likely to be most effective when working with other interventions in shifting social norms.
- Communications will often provide valuable support for policy interventions in influencing environmental factors.

Change4Life

The cross-government Obesity Team's Change4Life campaign aims to help families improve their long-term health by making positive changes to their lifestyle.

The Foresight report *Tackling Obesities: Future Choices*[28] concluded that obesity is caused by a wide range of factors, including environmental, economic, media, educational and technological factors, and that tackling it calls for a multi-faceted, cross-societal approach. Change4Life, which was launched in 2009, therefore forms part of a wider cross-government strategy, Healthy Weight, Healthy Lives, which includes initiatives such as building safe places to play, promoting healthy food in schools and the development of an active transport policy.

There is no behaviour change model for obesity prevention, so the Change4Life team based its marketing campaign on a hypothetical behaviour change journey derived from a review of behaviour change theories and research with the target market. The plan is to adapt the hypothesis as the campaign progresses.[29]

The right conditions for change

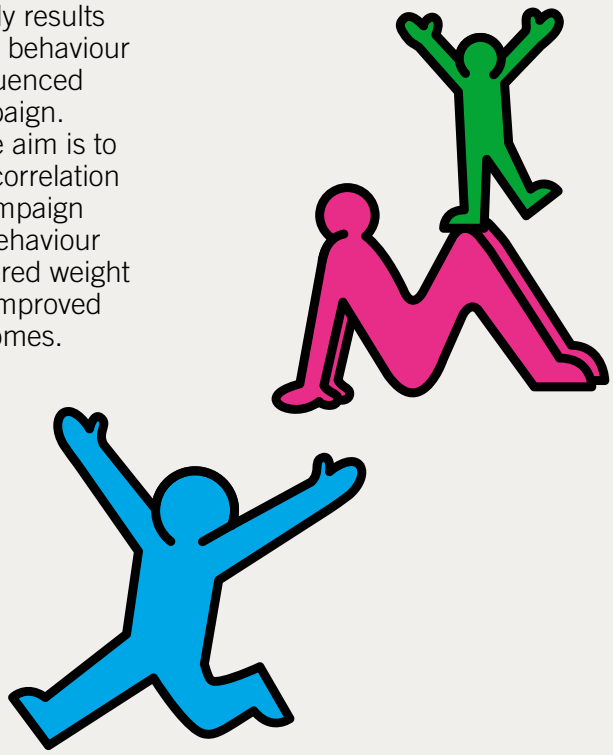
The most relevant models included Robert West's 'PRIME' Theory, the Theory of Planned Behaviour, Social Cognitive Theory and Social Capital Theory. The team agreed that the programme should be split into two steps: first, creating the right conditions for behaviour change; and second, supporting people on their behaviour change journey. Findings from the Tobacco Control campaign (see case study on page 43) suggested that the conditions for behaviour change included being dissatisfied with the present, having a positive image of the future and having specific triggers for action.

The marketing plan was therefore split into six phases, which map on to the behaviour change journey shown opposite:

- Pre-stage: engaging with workforces and partners, including local service providers and NGOs, both face to face and through direct marketing.
- Phase 1: reframing obesity as relevant to the target audience groups with the aim of encouraging a social movement, using TV, print and outdoor advertising, PR, a helpline, a campaign website and fulfilment materials, and by building partnerships.
- Phase 2: personalising the issue by making people realise that their behaviours could be putting themselves and their families at risk. The main mechanism for this was a questionnaire, asking families about a typical day in their lives. Responding to this questionnaire triggered individualised advice and guidance. Activity was targeted at postcodes with the highest risk of obesity.

28 Vandenbroeck P, Goossens J and Clemens M (2007), *Tackling Obesities: Future Choices – Building the Obesity System Map*, Government Office for Science, London..

29 Department of Health, Change4Life marketing strategy, 2009.



change 4 life

Eat well Move more Live longer

- Phase 3: defining the eight behaviours families should adopt and promoting them through advertising and a range of partners, using direct and relationship marketing and focusing activity on areas where target audience groups were most likely to live.
- Phase 4: inspiring people to change through real-life stories in the local and national press, and locally targeted activities.
- Phase 5: ongoing support and encouragement for at-risk families going through the change process, delivered by post and online.

Impact

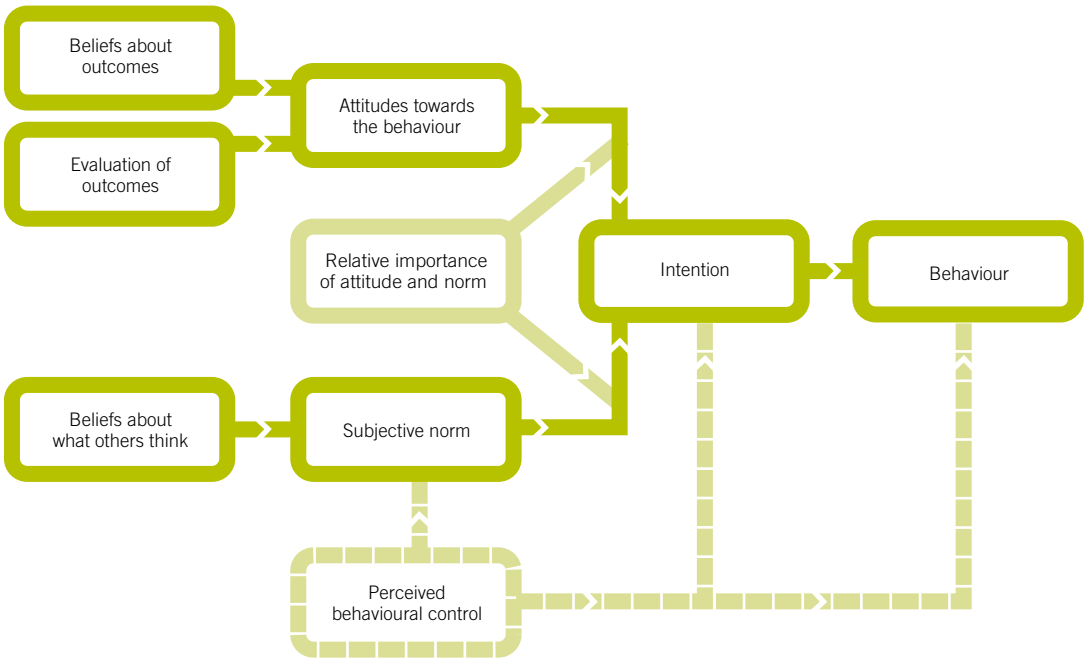
Although it is too early in the campaign to validate all the assumptions made about behaviour change, early results suggest that behaviour is being influenced by the campaign. The ultimate aim is to establish a correlation between campaign response, behaviour change, altered weight status and improved health outcomes.

Measuring Change4Life's impact through the behaviour change journey

Behaviour models: some examples

Models help us to understand the underlying **factors** that influence behaviour. There are many different social psychological models, some specific to particular behaviours and others more general, and it is worth spending time identifying which are most appropriate to the behaviour you are seeking to influence.

It is likely that you will identify a number of models that are relevant to the behaviour you are seeking to influence. From these, you will be able to identify those factors where communications are likely to have an impact. As discussed previously, models should be used in conjunction with other evidence to build up as comprehensive a picture as possible of the behaviour in question.



The three examples of models included here have been selected because they represent the differing levels of complexity and scale that can be found in models:

- **The Theory of Planned Behaviour:** provides an example of an intention-based model. It is also one of the best-known and widely used behavioural models.
- **The Theory of Interpersonal Behaviour:** builds on intention-based models by including other factors, notably habit. As discussed above (see page 17) this factor is a major influence on many of the behaviours that government is seeking to change.
- **The Needs, Opportunity, Ability model** refers explicitly to environmental-level factors, something that is relatively rare in social psychological models.

For a more comprehensive list of models, see the appendices to the GSR Review[30] which cover over 60 social psychological and behavioural models and theories and includes an appendix matching behaviour types or domains (for example environment, health or transport) to models.

30 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

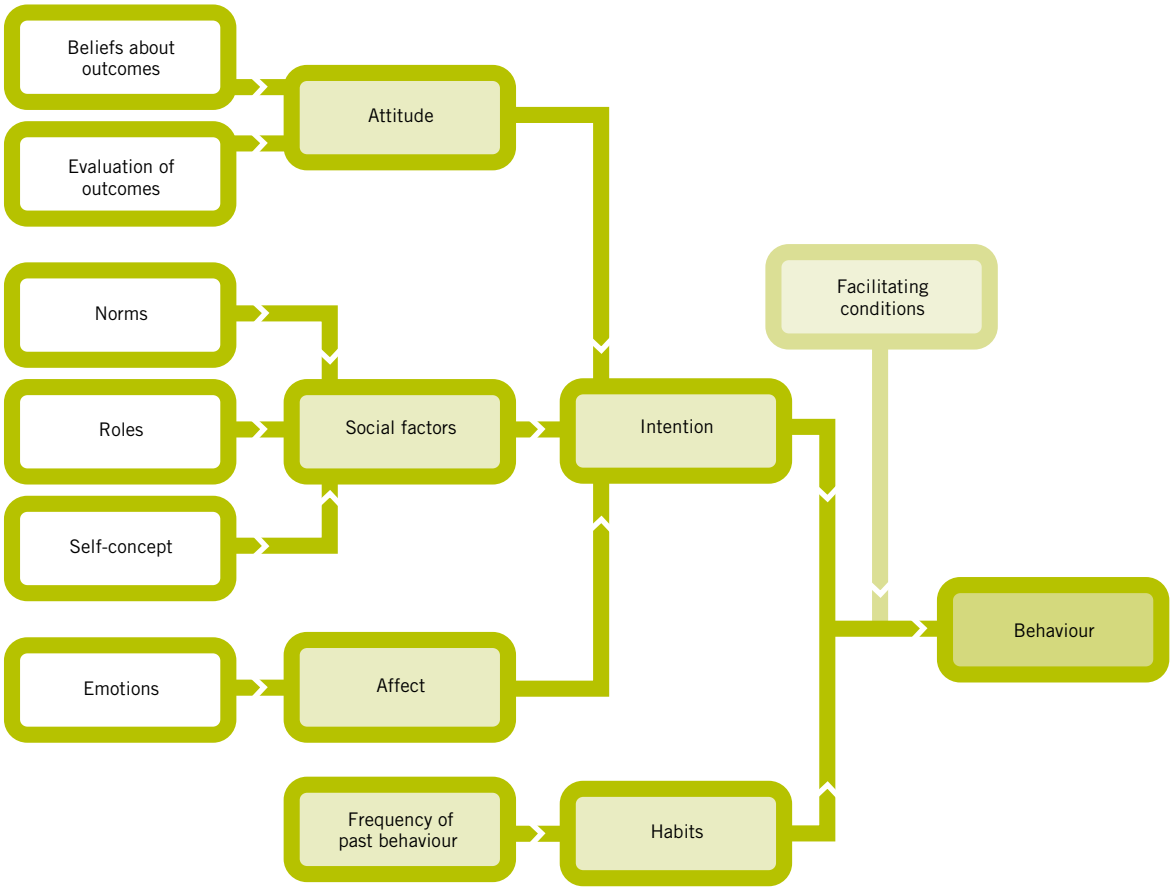
Ajzen's Theory of Planned Behaviour (1986)[31]

The Theory of Planned Behaviour

The Theory of Planned Behaviour (TPB)[32] is a well-known model that has been fairly widely used in the past, in part due to its relative simplicity and ease of use. According to the model, the key factors influencing behavioural intention are:

- attitudes towards the behaviour;
- subjective norms and;
- perceived behavioural control or agency.

Intention is seen as leading directly to behaviour.



The TPB is an 'adjusted expectancy value model'. Whereas an 'expectancy value' model is based solely on attitude, the TPB also recognises the influence of the 'subjective norm' (that is, how socially acceptable an individual believes their behaviour to be). It also includes 'perceived behavioural control', defined in this case as the ease (or otherwise) of performing the behaviour in question (see page 18, on self-efficacy).

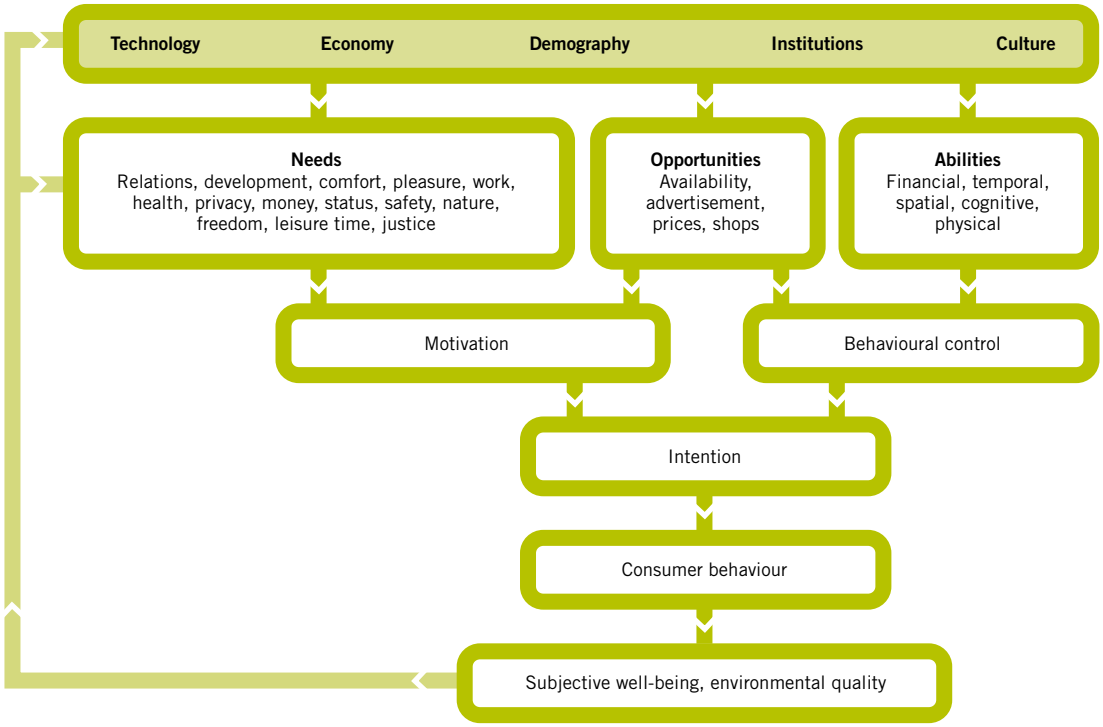
For these reasons, the model is seen as providing a more accurate prediction of behaviours than models based solely on attitude. Nevertheless, the TPB remains an intention-based model. Given that behaviour is driven by many factors other than intention, the model may be more effective at predicting intention than actual behaviour.

31 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses*, HMT Publishing Unit, London.

32 Ibid.

Triandis' Theory of Interpersonal Behaviour (1977)[33]

The Theory of Interpersonal Behaviour



Harry Triandis' Theory of Interpersonal Behaviour (TIB) also defines intention as one of the key factors influencing behaviour. However, unlike the TPB, it also recognises the role of habit and acknowledges the importance of environmental factors (called 'facilitating conditions' in the model). Triandis also recognised that behavioural intention is influenced by **emotions** and **social factors**, elements not included in the TPB.

Of the three directly influencing factors (habit, intention and facilitating conditions), Triandis saw habit as the most influential. He also believed that its influence increased over time and, therefore, that the influence of intention decreased. The more times a behaviour is repeated, the more **automatic** and less **deliberative** it becomes.

While the TIB is less widely used than the TPB, it can be particularly helpful in relation to regular/habitual behaviours such as car use.

33 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses,* HMT Publishing Unit, London.

Velk et al's Needs Opportunities, Abilities model (1997)[34]

Needs, Opportunity, Ability

The Needs, Opportunity, Ability (NOA) model of consumer behaviour is a good example of a model that explicitly incorporates factors at the environmental level.[35]

NOA consists of an intention-based model of individual behaviour 'nested' within a model that shows the influence of macro-level environmental factors. At the individual level, intentions are formed through both 'motivation' (which is driven by needs and opportunities) and 'behavioural control' (agency) (which is driven by opportunities and abilities).

At the macro level, needs, opportunities and abilities are influenced by the five environmental factors at the top of the model: technology, economy, demography, institutions and culture. The model shows a two-way relationship between environmental factors and consumer behaviour, with a large 'feedback loop' linking the top and bottom levels.

Perhaps because of its greater complexity, the NOA is used less frequently than either the TPB or the TIB. However, it provides a valuable demonstration of how environmental factors can influence behaviour and shows clearly that focusing only on personal factors will not be enough to bring about change.

'The NOA emphatically shows the interaction between individual and society, and demonstrates the need for interventions to work on multiple levels of scale.[36]

The FRANK case study (overleaf) provides a practical example of how a behavioural model has been used to inform a communications strategy.

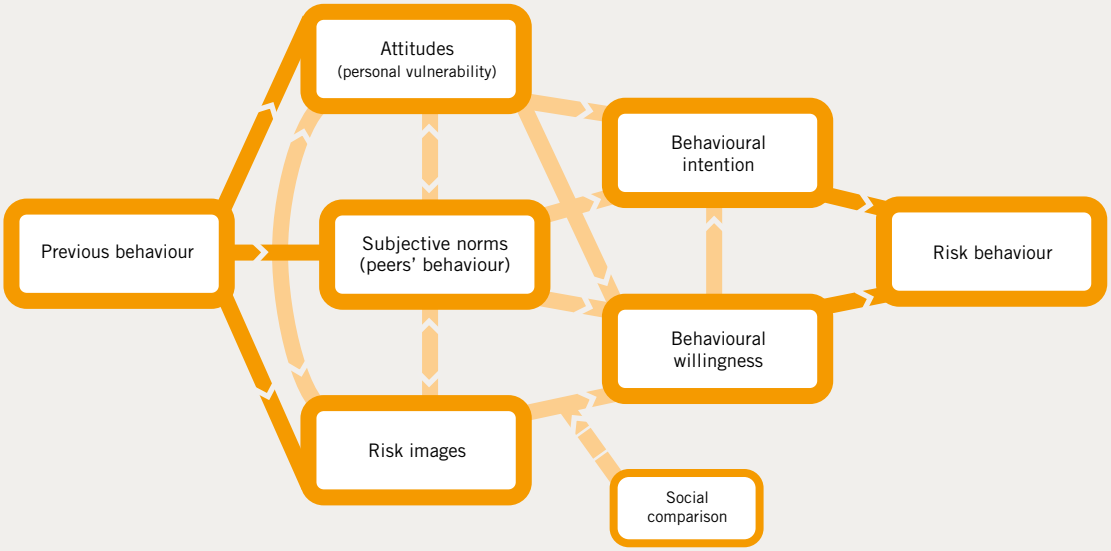
FRANK

In 2005, the FRANK campaign team set out to adopt a more targeted approach to communicating with young people about drugs

Desk research into the best ways of communicating with young people about drugs[37] identified Gibbons and Gerrard's Dual Path Theory[38] as an effective way of addressing risk issues where there was no direct correlation between attitude and behaviour.

Dual Path Theory behavioural model



Gibbons and Gerrard's model reflects the fact that drug taking involves rational, irrational and social factors and informs four potential roles for intervention communications:

- boosting young people's resistance (**behavioural willingness**);
- encouraging young people to see drug use as marginal rather than mainstream (**subjective norms** – peers' behaviour);
- emphasising the risks involved in taking drugs (**personal vulnerability**); and
- undermining the image of drug users (**risk images**).

Insights and implications

The model research yielded a number of valuable insights. The first was that if a young person has previously used a drug, this will inform their future drug-taking behaviour. Communications therefore work best when they are targeted at young people before they become regular drug users. The FRANK campaign is not interested in outright rejecters, so resources have been focused on young people who are thinking about taking a drug for the first time and occasional users.

Secondly, younger adolescents (11–14 years old) are heavily influenced by their peers. Even where there is a strong intention not to use drugs, their high level of **behavioural willingness** means that they will look to their peer/

FRANK

social group when making a decision. Messages therefore encouraged this group to contact FRANK for expert advice rather than listening to their friends.

They also indirectly promoted negative perceptions of drug users and emphasised the risks of drug taking. The campaign focused on cannabis, the most prevalent drug for this age group.

Thirdly, young people aged 15+ tend to think more rationally about the risks of drugs and be more drug experienced. Their decisions are more likely to be informed by their own sense of personal vulnerability as well as by their peer/social group. Messaging for this group therefore focused on the risks involved in using drugs (mainly cocaine) and on building up trust and confidence in FRANK.

Impact

This model-driven approach to the campaign is reflected in its evaluation. Key performance indicators (KPIs) include the number of young people contacting FRANK, increasing awareness of the risks, strengthening resistance and promoting negative perceptions of drug users. The campaign has achieved considerable, measurable success in these areas since the model was adopted.

Knowing and trusting FRANK as the expert on drugs:[39]

- Total awareness of the FRANK campaign among the target group is 90 per cent.
- FRANK is the **most trusted** source of drug information and advice for young people
  - 81 per cent trust FRANK to provide them with reliable information;
  - 59 per cent would turn to FRANK for information about drugs, compared with 44 per cent who would turn to their mother, 22 per cent who would turn to their friends and 20 per cent who would turn to their doctor.

Perceived risk of drugs (of cannabis among the 11–14s and cocaine in the 15+ group):

- The percentage of 11–14-year-olds agreeing that cannabis is very likely to damage the mind rose from 45 per cent in April 2006 to 63 per cent in April 2009.
- After the last burst of cannabis advertising (February 2009), 74 per cent said the advertising made them realise that cannabis is more risky than they thought.
- After the last burst of cocaine advertising (January 2009), 67 per cent said the ads made them realise that cocaine is more risky than they thought.

Negative perceptions of drug users (negative average out of 10):

Drug user	March 2006	April 2007	March 2008	5 April 2009
Cannabis[40]	7.2	7.5	7.5	7.7
Cocaine[41]	7.4	7.6	7.8	8.0

Note: The higher the score the more negative the perception is of users of that drug.

Building young people's resistance skills

- After the last burst of cannabis advertising, 73 per cent said that the advertising made them less likely to take cannabis in the future.
- After the last burst of cocaine advertising, 62 per cent said that the campaign made them less likely to take cocaine in the future.

39 Tracking survey (Synovate).

40 Base: young people who have never used cannabis.

41 Base: young people who have never used cocaine.

Key learnings

- Models should be used as tools to identify factors that influence the behaviour you are seeking to change.
- You may find that there are a number of models that are relevant to the behaviour.
- Not all models include factors at the environmental level, but it is nevertheless critically important to identify these and build them into your planning.
- Models should be used in conjunction with primary research and other evidence to build up a full picture of the behaviour. This can then be used to develop an intervention/communications strategy.

Understanding how behaviour changes

In the section headed 'Understanding the factors that influence behaviour' (see page 15) we looked at the various factors that can influence behaviour. In this section, we will look at some theories on how behaviour actually changes. Anyone working on communications aimed at influencing behaviour will need an understanding of the main theories of behaviour change and their implications for communications.

The Stages of Change

The best-known theory of behaviour change is the 'Stages of Change' model,[42] developed in the late 1970s and early 1980s by James Prochaska and Carlo DiClemente and based on smokers' approaches to giving up cigarettes.

Since then, this model has been used for a wide range of primarily health-related behaviours, including weight loss and alcohol and drug problems. The central idea is that behaviour change comprises six stages, with people progressing from one to the next at their own pace.

The six stages of change are:

1. **Pre-contemplation:** The individual has no intention of changing their behaviour in the foreseeable future (usually defined as the next six months), possibly because they have not yet acknowledged that there is a problem behaviour that needs to be changed.

2. **Contemplation:** The individual acknowledges that their behaviour needs to change. While they are not yet ready to change, they intend to do so within the next six months.

42 See Prochaska J and Velicer W (1997), 'The Transtheoretical Model of Health Behaviour Change', *American Journal of Health Promotion,* 12(1), 38–48.

3. **Preparation:** The individual is preparing to change their behaviour within the next month and may already have devised a plan of action.

4. **Action:**The individual has changed their behaviour within the past six months.

5. **Maintenance:** The individual is actively maintaining the changed behaviour (although they can still relapse at this stage).

6. **Termination:** The new behaviour is embedded and the individual is confident that they will not relapse. Their self-efficacy (see page 18) is high.

Individuals are segmented by stage. 'Staged-matched interventions' have been devised and provide suggestions as to how people at each stage can best be moved forward. Over recent years, however, the model has been subject to criticism, with some arguing that there is no evidence that stage-matched interventions are any more effective than other interventions, and that interventions can work at any stage of the change process.

Nevertheless, the model can provide a useful way of identifying where an individual is in their 'change journey' and understanding what this means for targeting and messaging. For instance, individuals who are interested in changing their behaviour (ie who are in the 'contemplation' stage) may be a useful primary target for any communications activity.

Rogers' Diffusion of Innovations

This well-known theory seeks to explain how new ideas and technology spread through society by 'diffusion', defined as 'the process by which an innovation is communicated through certain channels over time among the members of a social system'.[43] Its basic premise is that people fall into the following five categories, according to how likely they are to adopt particular 'innovations':

1. **Innovators**: The first to adopt. As a group they are more willing to take risks. They also tend to be young and to belong to the higher social classes.

2. **Early adopters:** Tend to be seen as opinion leaders among the later adopter groups and, like innovators, tend to be younger and from higher social classes.

3. **Early majority:** Later to adopt than innovators and early adopters. Innovation 'spreads' through contact with early adopters. They are also seen as opinion leaders by some.

4. **Late majority:** Adopt innovations later than average and tend to be more sceptical than the above groups. They are less likely to show opinion leadership than groups 1, 2 and 3, and have less contact with earlier adopter groups.

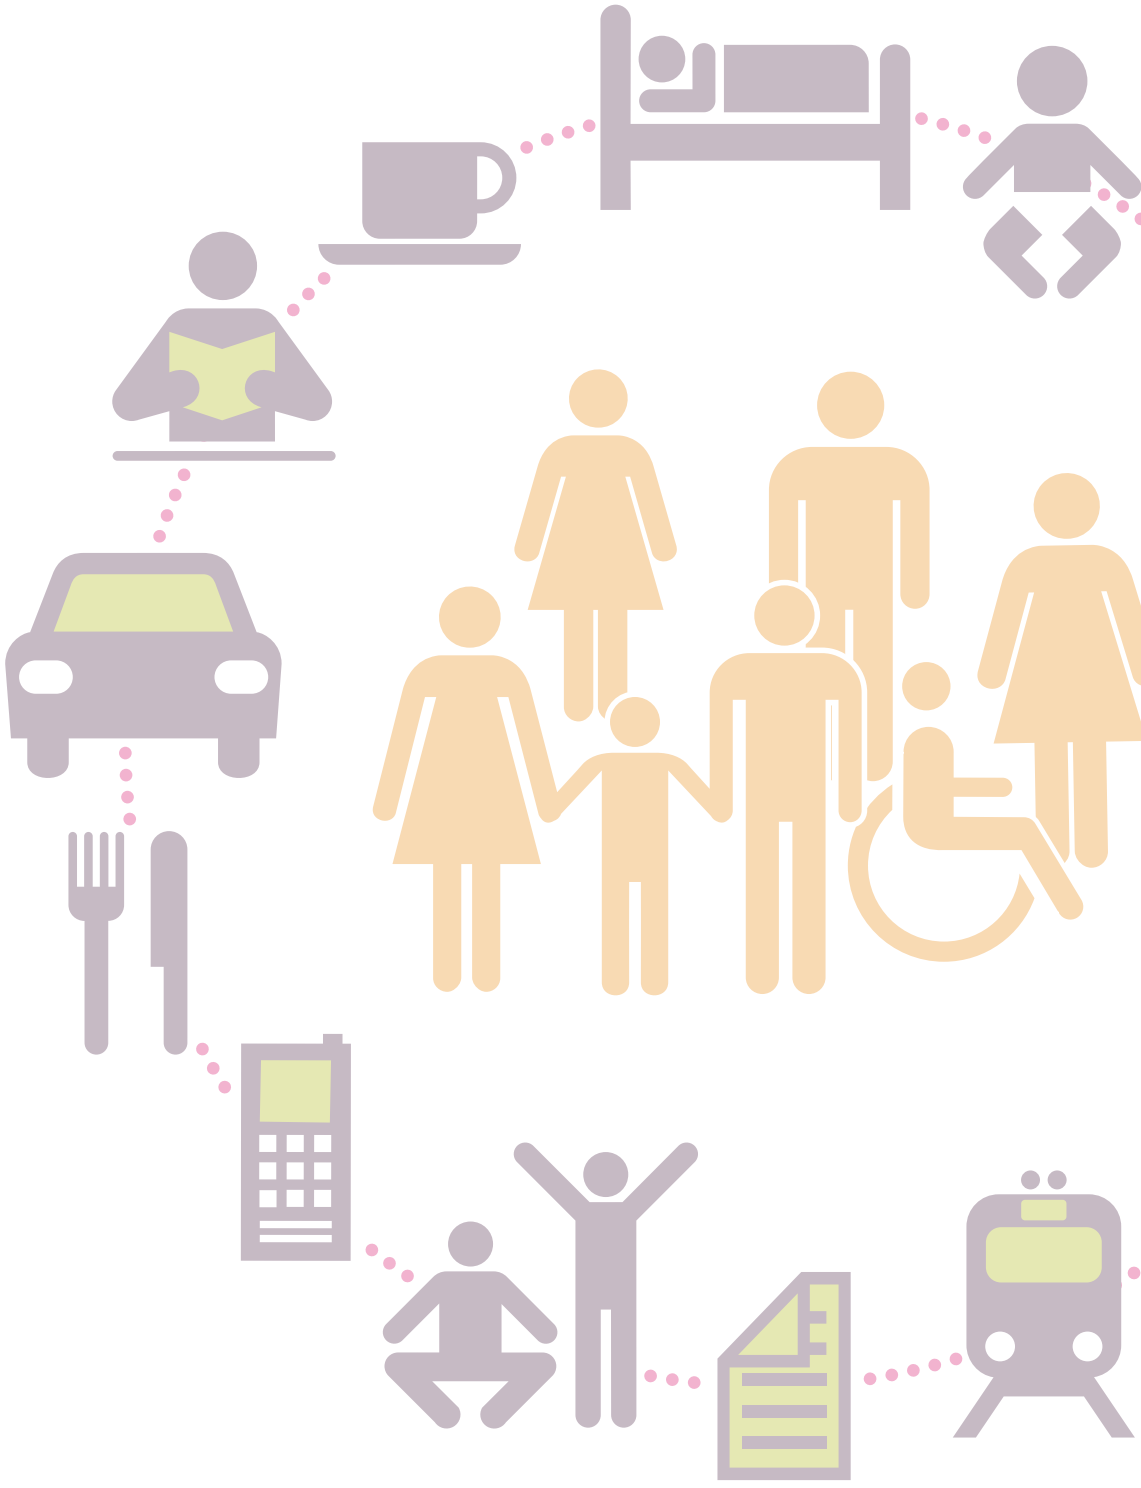
5. **Laggards:** Adopt innovations later than all the other groups. Laggards tend to be older and are not usually opinion leaders. Their networks tend to be limited to family and close friends.

43 Rogers E (1995), *Diffusion of Innovation*, Free Press, New York.

It is notable that the groups most likely to adopt an innovation early on tend to demonstrate higher levels of opinion leadership (that is, to be held in high regard and have their opinion respected by others). Opinion leadership is often subject-specific; it is possible to be an opinion leader in relation to one innovation but a follower with regard to another. Rogers argues that adoption depends on access to 'information' about the innovation, and that this information should be tailored to the group.

According to the theory, innovation spreads gradually through the first groups. When the level of adoption reaches between 10 and 20 per cent (Gladwell's 'tipping point'[44]) the rate of adoption suddenly increases steeply before levelling off at around 80 to 90 per cent. Diffusion itself also follows a five-stage process:

1. **Knowledge:** The individual is aware of the innovation but lacks information about it.
2. **Persuasion:** The individual becomes interested in the innovation and seeks information about it.
3. **Decision:** The individual weighs the pros and cons and decides whether or not to adopt the innovation.
4. **Implementation:** The individual adopts the innovation.
5. **Confirmation:** The individual decides to continue using the innovation.



The theory is based on a deliberative linear process similar to that shown in the AIDA marketing model (see page 15). The individual decision as to whether or not to adopt the innovation is very 'rational'.

This theory of change has been widely used in commercial marketing, principally in relation to the adoption of new technologies and products rather than behaviours. Nevertheless, the concept of opinion leaders as important agents of change is a useful one, as is an understanding of how change spreads through society. Both these factors support the case for using communications to target opinion leaders (in the hope that they will then spread the message and encourage take-up among others) and for peer-to-peer marketing that exploits the power of social networks.

Key learnings

- As well as understanding the factors that influence behaviour, it is important to understand how behaviour changes.

44 Gladwell M (2000), *The Tipping Point: How Little Things Can Make a Big Difference*, Little, Brown, London.

EMBEDDING BEHAVIOURAL THEORY

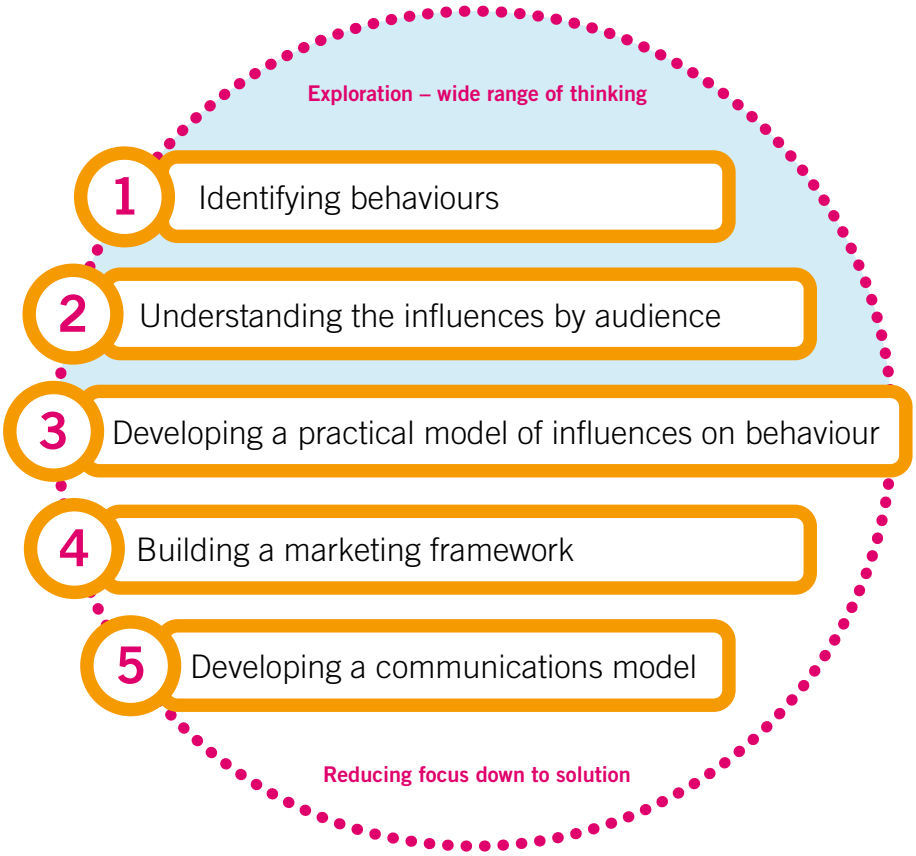
This section focuses on how behavioural theory can be used to support the practical planning, delivery and evaluation of communications. This will help to ensure that communications are designed with a realistic understanding of what they can be expected to achieve, within what timescale and at what cost.

'What influences people's behaviour?' demonstrated some of the ways in which behavioural theory can help us understand human behaviour. However, it also highlighted some of the complexities of the field, and showed that there is no one simple way of addressing communications challenges.

The process set out here recognises and reflects that complexity, but is nevertheless designed to be practical. It is not prescriptive; rather, its aim is to show how behavioural theory can be used to support the development of a robust communications model. We appreciate that communications teams are often working to tight time constraints. This process is designed to be usable and achievable within tight deadlines, and can be adapted to work within both shorter and longer timescales.

For clarity and simplicity, we have split the process into five steps, as shown in the figure overleaf.

The five-step process



Many communications and policy formation projects are already broadly following all or some of these steps. However, what is often missing is any systematic attempt to utilise the value of behavioural theory throughout the process and to share knowledge between all of those involved in developing interventions, including communications teams and their agencies.

At each stage of the process, an example drawn from the Department of Health's Tobacco Control project brings the theory to life by showing how that step could operate in practice.

'We need an even better understanding of human behaviour, not just to arrive at the optimum solution in terms of motivation but also to understand how to get as close as possible to the behaviour under investigation to stand the greatest chance of influencing it.' Judie Lannon[45]

45 COI/IPA (2008), *How Public Service Advertising Works,* World Advertising Research Centre, London.

The five-step process

Why use the five-step process?

Identifying, translating and applying relevant behavioural theory from the outset will help you to:

- make sure that the right questions are asked and the right people are involved;
- build close working relationships between communications and policy teams and external agencies;
- set clear expectations as to what communications can achieve;
- identify new roles for communications;
- identify the types of agencies that should be involved in the process and ensure that their energies are focused on addressing the challenge, rather than defining it; and
- support robust evaluation based on a clear, shared understanding of objectives and the role of communications in achieving them.

In practice: background to the strategic review of the Tobacco Control campaign

The behavioural goal of the Department of Health's Tobacco Control marketing and communications strategy 2008–10 is to help reduce smoking prevalence to 21 per cent among the general adult population and to reduce the prevalence among routine and manual workers to 26 per cent.

Before a recent strategy review, Prochaska and DiClemente's Stages of Change model (see page 36) played a major role in shaping communications activity. The model was used both to focus the creative targeting of campaigns (for example, campaigns about NHS Stop Smoking services targeted those in the preparation phase) and to evaluate them (for example, analysis of campaign tracking data was based on the stages within the model).

For one part of the campaign, the 'Together' programme, the Prochaska model has formed the basis of the entire contact strategy. Together, which is still in use, offers remote support to move potential quitters from preparation to maintenance (that is, from stage 3 to stage 5 of the model). The blueprint for content creation and the timing of messages are entirely dictated by the model.

However, while the Stages of Change model has been invaluable in structuring thinking, it is a model about how behaviour changes, not what influences behaviour. Many important influences in smoking cessation – such as the impact of legislation and pricing – are 'off the model' and not explicitly described.

Moreover, there was growing clinical evidence that interventions tailored around the model were no more effective than untailored approaches. The strategic review of Tobacco Control communications presented an ideal opportunity to survey the behaviour change landscape and identify a more appropriate model.

Step	Key questions	Outcome	
Step 1 Identifying behaviours	• Are we addressing single or multiple behaviours? • How do we break down the issue into its component behaviours? • How do multiple behaviours relate or group? • Who do we want to undertake the behaviour? • What is the desired and current behaviour? • Does the behaviour involve people starting, stopping, maintaining or preventing?	Agreed target behaviours	Exploration

Identifying behaviours

Step 1 involves identifying the behaviour or behaviours that your policy and/or communications activities are seeking to influence.

As previously mentioned, sometimes government communications will seek to influence a single behaviour – for example, getting drivers to reduce their speed. But many of the more complex issues government is seeking to address, such as climate change and obesity, will require changes in multiple behaviours.

If you are aiming to influence a single behaviour, or the component behaviours have already been identified, go straight to step 2. If not, your starting point should be to identify all the relevant behaviours relating to your policy and communication goals (which may not necessarily be the same) (see pages 13–15 for more detail). Otherwise, it will be impossible to develop an understanding of the factors that influence those behaviours.

Step 1 in practice: the Tobacco Control campaign

The Department of Health identified two key behaviours that it would need to influence in order to reduce smoking prevalence:

- whether or not an individual chooses to make a quit attempt; and
- the method by which they choose to quit.

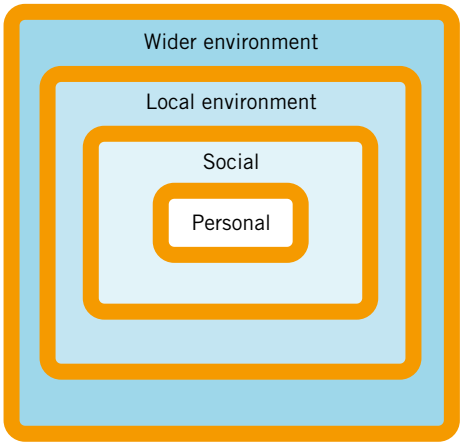
By getting more people to make quit attempts the aim is to increase the 'market' for quitting. In influencing 'how' people quit, the aim is to increase the overall success of quit attempts. Evidence shows that some methods of quitting are more successful than others: for example, smokers who quit with NHS Stop Smoking services are four times more likely to succeed than those who go 'cold turkey'.

Step	Key questions	Outcome	
Step 2 Understanding the influences by audience	• What factors are at play at the following levels: – **personal** (for example habit, emotions, confidence, knowledge, biases or mental shortcuts)? – **social** (for example is the behaviour with or against social norms, peer pressure, who will influence and how strongly)? – **local and wider environmental** (for example access, price, opportunity, services, proximity)? • How do factors differ across audiences? How does their importance vary across different audience groups?	Detailed understanding of all influencing factors	Exploration

2

Understanding the influences by audience

The next step is to identify all the factors influencing the behaviour(s) that relate to your policy and communication goals. These factors will vary among different audience groups. Behavioural theory should play an important role in this task.

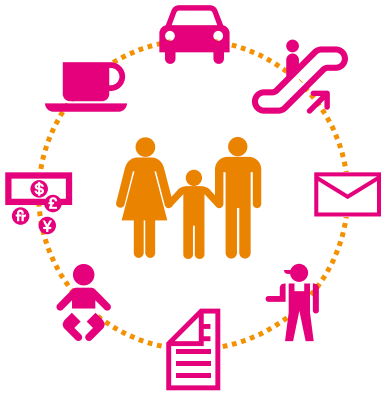


The factors influencing behaviour can be divided into broad levels: personal, social and environmental (both local and wider). (See pages 15–27for more detail.) You will need to consider factors at all these levels. Note that this may mean considering more than one behavioural model and looking at other relevant theories.

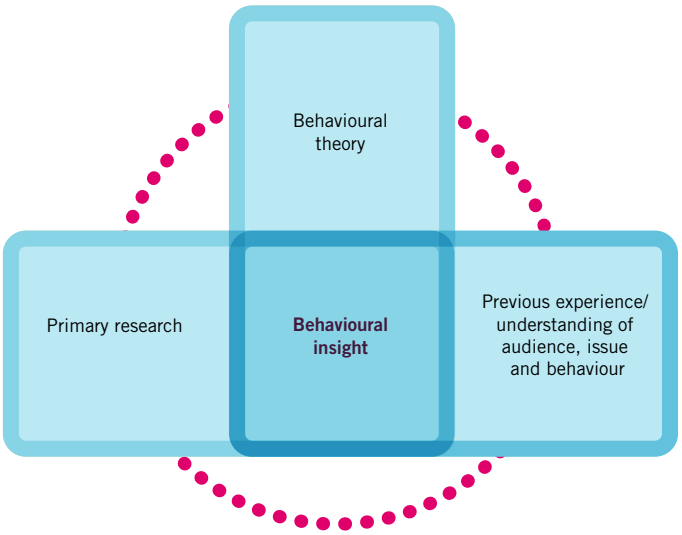
The GSR Review[46] describes over 60 models and theories and includes an appendix that matches behaviour types or domains (eg environment, health, transport) to models. This can be a useful starting point for identifying relevant models and factors that influence the behaviour(s) in question.

Generating behavioural insight

As noted above, behavioural models and theories are often based on a theoretical 'everyman'. Models do not always indicate the relative importance of factors, and some are developed with a specific behaviour in mind. To develop meaningful insights into the reasons why people behave as they do, you will need to draw on other information (including primary research) as well as on behavioural theory.



In practice, steps 1 and 2 are likely to be iterative. Exploring the factors that influence one behaviour might highlight another behaviour that could be easier to influence, or where communications have a more obvious role to play. In this case, you will need to go back to step 1 and add the 'new' behaviour to your list before proceeding again to step 2.



46 Darnton A (2008), *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses,* HMT Publishing Unit, London.

Creating an accurate segmentation will mean exploring people's claimed behaviours; intentions; attitudes; physical, practical and psychological barriers; motivations; goals; and levels of self-efficacy. You may also wish to find ways of linking the segmentation with data describing the actual behaviour of different groups.

Consider links to planning tools such as TouchPoints,[47] TGI[48] and MOSAIC,[49] which leave detailed information on demographics, geodemographics, life stage, media consumption and attitudes, supporting the segmentation process. The tools will help to ensure that your segmentation is actionable, and are best used to supplement your own primary research. The Cabinet Office has produced guidance on segmentation.[50]

Combining sources to generate 'behavioural insights'

The figure above shows the range of sources that will often need to be used to help generate behavioural insights. Techniques may include:

- drawing on the knowledge and experiences of relevant stakeholders, for example frontline service staff;
- reviewing and analysing existing information (including relevant behavioural theory) and data through desk research;
- qualitative and ethnographic research or customer immersion; and
- using semiotics to look at how specific audiences construct and understand meaning.

Behavioural insights can then help to identify the most important influencing factors – that is, those that have the strongest influence on the behaviour or behaviours in question.

Carrying out a bespoke segmentation can help you identify how the factors that influence behaviour affect different audience sub-groups.

47 IPA TouchPoints is a consumer-focused multi-media database designed to provide insights into how people use media.

48 The TGI Survey enables an understanding of consumer attitudes, motivations and behaviour.

49 MOSAIC classifies residential postcodes into 12 lifestyle groups.

Segmentation in action: HMRC

When HM Revenue & Customs set out to segment its target audience by looking at the factors that influence their behaviour in relation to tax, the first step was to scope the issue through a large-scale data review and over 100 interviews. These were used to develop a framework that identified the factors driving the way that people behave. Qualitative research followed, and was used to design a major piece of quantitative research. The findings pointed to five distinct segments, based on four dimensions: awareness (of obligations); motivation (to comply); ability (to comply); and opportunity (to comply).

Step 2 in practice: the Tobacco Control campaign

The Department of Health used a number of different models and theories to gain further insight into the factors that influence smoking behaviour, as well as primary research with the target audience and interviews with academics and practitioners. A number of new insights emerged from these sources.

Many theories identify the role of attitudes and beliefs in driving motivation. For smoking cessation these operate in two ways: by shaping the desire to stop smoking (through beliefs such as 'smoking harms me and my family'); and by shaping positive images or a 'vision' of the future. This latter form of 'positive motivation' was particularly important, as primary research among the target audiences identified that while many smokers had a strong desire to stop smoking, there were far fewer positive associations with the concept of being a 'non-smoker'.

Robert West's 'PRIME' Theory of motivation identified the need for a trigger as well as motivation to drive a quit attempt. Previous marketing had sought only to drive motivation.

The concept of self-efficacy or agency (the extent to which an individual believes that they can carry out a particular action successfully and that that action will bring about the expected outcome) has been identified in many theories, including the Theory of Planned Behaviour and the Theory of Reasoned Action. The role of self-efficacy was also highlighted by NHS Stop Smoking service practitioners and is summarised in the model subsequently developed (see below) as 'confidence in ability to quit'.

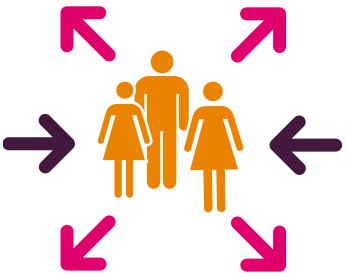
The impact of social norms on behaviour is also explicit in many models, and research among the target audience highlighted the role of peer pressure in driving both quit attempts and relapse. This was captured in the model as an influence that drove 'positive environmental pressure to quit'.

Many other influences that operate at a cultural or environmental level – such as legislation and price – play a very important role in driving cessation and influence the 'environment' for quitting.

Finally, in order to successfully change their behaviour smokers have to know **how** to change successfully. In culture change models this is sometimes referred to as 'practical steps for action'.

Step	Key questions	Outcomes	
Step 3 Developing a practical model of influences on behaviour	• How do we prioritise the factors identified at step 2? • How do these factors influence current and desired behaviours? • What is the relative importance of the factors? • Do we have data to measure the factors? • Can we build a data-driven model? • If we can't, what are the pragmatic hypotheses we can work with and test? • What are our early hypotheses about how behaviour might change? • What are our early hypotheses about the role that communications might play?	• Model of key influencing factors • Understanding and/or measurement of how the factors work together and their importance • Initial hypothesis about role of communications	Towards a solution

3



Developing a practical model of influences on behaviour

The insights into behaviour developed at step 2 can now be used to develop a practical model that brings together all the relevant behaviours and influencing factors, and which is based on a deep understanding of the relationship between current and desired behaviours and the key influencing factors involved. Sometimes, it will be appropriate to adapt an existing model; at other times, you will need to create a model specifically for the task in hand.

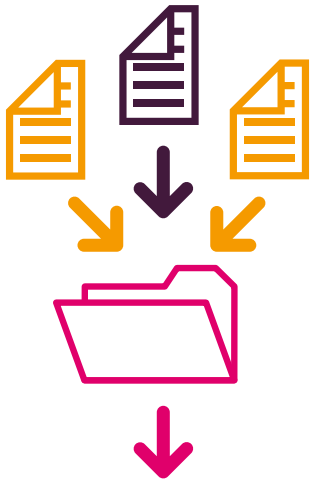
Developing a practical model will require input from people with a range of different skills, including experts in behaviour (who may well be academics) and experts in policy and communication. This will help ensure that the model works across all interventions, not just communications, ensuring consistency and coherence.

The model should be dynamic and have a temporal element too it so that it can adapt in line with changing circumstances. For example, a model developed two years ago might not take into account the economic downturn, and would need to be updated to reflect the impact of this factor on customers' attitudes, behaviours and intentions. The simplest solution is to schedule regular reviews into your planning process.

Whether it is data-driven or not, a practical model is essential. It will help to focus thinking about the behaviour(s) in question and the influencing factors, and can be used to develop a marketing framework (see step 4 below).

Often, practical models are developed both from a behavioural theory (explains behaviour) and change theory (explains how to change behaviour) perspective.

Using the behaviour model to create hypotheses of change



Interrogating the model can help you to develop hypotheses about how change might take place and (in the case of data-driven models) to predict the role that communications might play within the wider intervention mix. This information can then be fed into the marketing framework (see step 4). You can use the model to answer the following questions:

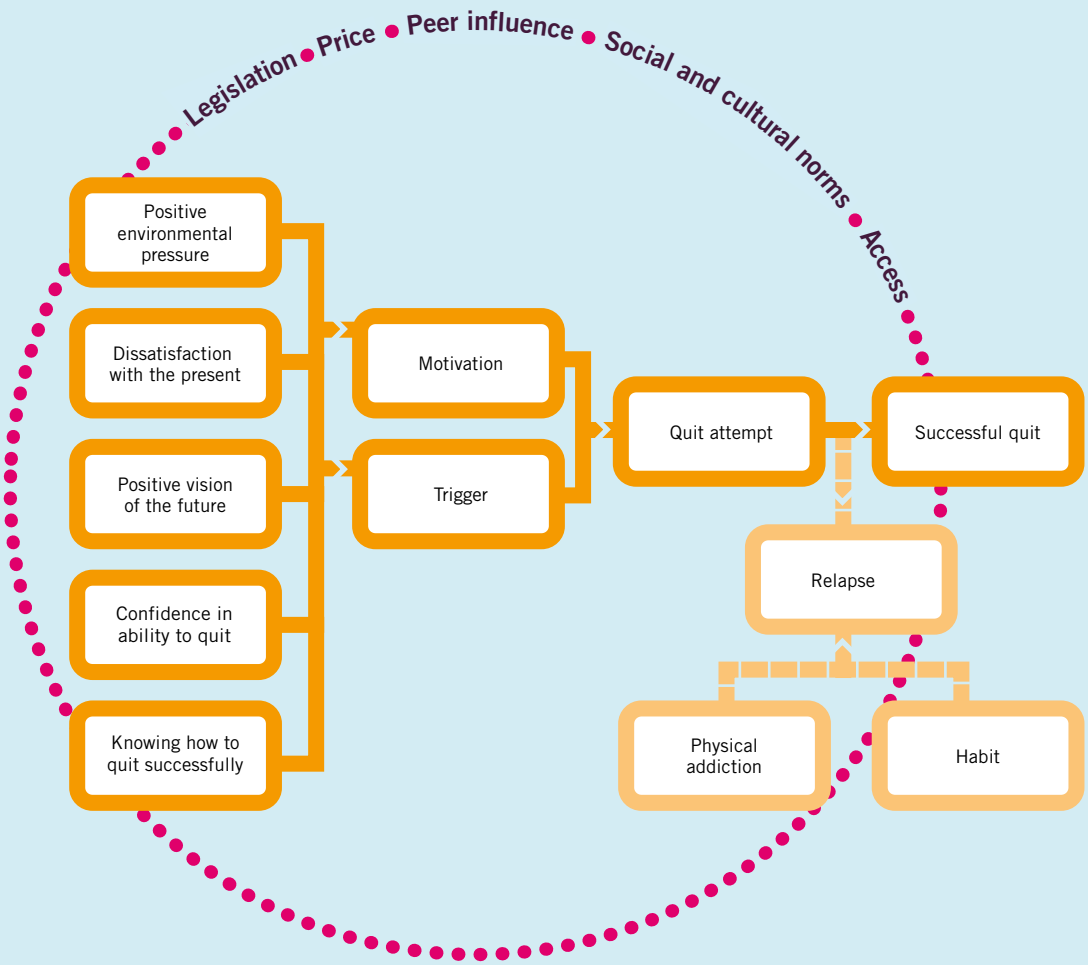
- Which influencing factors have the biggest impact on the behaviour(s) we are seeking to change?
- Where can communications legitimately play a role?
- How much of our budget should we allocate to communications and how much to other interventions?

Testing the model

You can test your model by populating it with data that measure factors and behaviour (note that you may need to use proxy data measures against some inputs). It can then be used to predict the outcomes of different interventions. The data will need to be measured over time to allow understanding of how the behaviour changes.

Once you have data or proxy data for each factor, you can use a statistical technique for modelling the relationships between variables (such as linear regression or agent dynamics) to produce a predictive tool. This can be used to predict the response to future interventions and also look at future trends.

Data-driven models should always be created in partnership with policy colleagues. Such models require considerable resources, and may not always be achievable at the outset. In practice, ongoing evaluation should aim to create a data-driven model that can then be used to adapt and refine the communications strategy.



Step 3 in practice: the Tobacco Control campaign

The influences that were identified in step 2, along with the conditions for successful behaviour change, are captured in this generalised model of smoking cessation (see figure).

Identifying the influences on behaviour change has shaped the Department of Health's marketing and communications strategy in many ways. Most profoundly, it has helped to define marketing objectives and to develop the workstreams that contribute to meeting those objectives.

The department also developed a data-driven model that would quantify the impact of levers such as price and legislation and help everyone involved gain a better understanding of the scale of the task for communications. For example, when first developed in 2007, the model identified that the all-adult prevalence target would be met but that the target for prevalence among routine and manual workers was much more challenging. Among this audience, 530,000 smokers needed to quit in order to hit the target. The model showed that communications should deliver 298,000 of these. The model is updated on a regular basis as new information emerges, and it continues to be used to help set quantifiable targets for communication and to aid budget setting.

Generalised and simplified smoking cessation behavioural model

Step	Key questions	Outcomes	
Step 4 Building a marketing framework	• What factors will marketing/interventions need to target? • Where will communications play a role? What factors will they affect, and how? Will they play a leading or supporting role? • What are the communications objectives? • What are our top-line evaluation metrics for these communications objectives?	• An understanding of the role of communications and the factors they are designed to influence • An agreed set of communications objectives • How communications fit into the wider picture • Top-line metrics for setting and evaluating key performance indicators	Towards a solution

Building a marketing framework

Techniques such as systems thinking (see page 13) and approaches such as social marketing show the benefits of looking at communications in the context of all interventions rather than in isolation. Communications should be designed to complement and reinforce other interventions. In the private sector, this holistic approach is generally seen as the key to effective marketing and the most 'joined-up' companies are usually the most successful.

The basic idea underpinning systems thinking is that the whole is more than the sum of the parts, and that putting pressure on a single point will impact on the rest of the system. For example, if a police drug seizure reduces supply but demand remains constant, the price of drugs will increase and other supply streams will open up. The main purpose of the marketing framework is therefore to show how all interventions – including, for example, legislation, enforcement and stakeholder engagement as well as communications – can work together to deliver change.

The framework will help to identify the role – or roles – that communications can play. Often, this will be to influence factors and/or intermediate behaviours rather than to have a direct effect on the end behaviour. As the case study earlier shows (pages 34–35), one of the key aims of the current FRANK campaign is to make drug use less appealing by focusing on non-aspirational and unattractive images of drug users.

In other cases, communications may be used to support and maintain the behaviour change once it has taken place (for example, by supporting people who have given up smoking so that they don't relapse).

It is important to recognise that, in some instances, taxation and legislation (for example) may be more effective than communications in changing behaviour. However, even in these instances communications are likely to play a supporting role. It is therefore important to take care when identifying the role we expect communications to perform.

Setting objectives and writing a brief

The marketing framework should be used to identify and set communications objectives. In practice, these objectives are often to change one or more of the factors that influence behaviour, rather than the end behaviour itself.

The communications objectives – combined with an audience segmentation, as described above (page 46) – can be used to generate a high-level evaluation matrix and plan. It is important to remember that communications may need to be assessed in terms of their impact on influencing factors rather than on the actual behaviour itself. Any evaluation of communications must therefore form part of a broader evaluation framework or at least attempt to separate out the effect of other influences and/or interventions.

You should now have all the information you need to create a communications brief. The brief should reflect the five-step process, and take into account all other relevant interventions. It should also include the behaviours you have identified as relevant to your policy and communication goals, the influences that affect those behaviours, your communication objectives and your top-line KPIs.

Step 4 in practice: the Tobacco Control campaign

The marketing/interventions framework identifies the role for marketing in the context of other interventions such as legislation and price. It should include the behavioural goals, the conditions for change and the primary and secondary change agents for helping to bring these about. So, for example, we see that one of the necessary conditions for tobacco control is to create dissatisfaction with the present. The interventions aimed at bringing this about are marketing and communications and legislation.

The marketing/interventions framework

Behavioural goals:
1. To decrease smoking prevalance among routine and manual workers to 26 per cent by 2010 by:
2. Increasing the number of quit attempts
3. Increasing the success of quit attempts.

Conditions for change	Positive environment for quitting	Confidence in ability to quit	Dissatisfaction with present	Positive vision of future	Triggers for action	Knowledge of how to quit
Primary change agent	Legislation	NHS services/ medication	Marketing and communications	Marketing and communications	'Natural' triggers; eg life stage, illness	NHS service/ medication
Secondary change agent	Price		Legislation	Legislation	Marketing and communications	Marketing and communications

Step	Key questions	Outcomes	
Step 5 Developing a communications model	• Does everyone involved understand the role communications can play and the factors they are aiming to influence? • How do we expect communications to influence people's behaviour over time? • What are the key triggers and barriers at each stage of our change journey? • How will communications influence these? • Where do communications fit within the marketing framework? • How do we evaluate each stage of the change journey? • How can we use our learnings to adapt our practical model? • How can we use our learnings to adapt our hypothesis?	• A communications strategy • An understanding of whom communications are targeting and where communications fit into the overall picture • An evaluation plan and matrix	Towards a solution

Developing a communications model

The marketing framework developed in step 4 should define:

- the role of communications (which factors it is aiming to influence and how);
- where communications fit into the wider picture;
- top-line metrics for setting and evaluating KPIs; and
- the target audience and its behaviour(s).

Once your communications brief is in place, you can move on from looking at behavioural theory to consider how change theory can help you develop a strategy for bringing about change. Academic theories of change can be useful here, although they will need to be adapted to reflect the specific behaviours you are seeking to influence; this may require you to formulate and test hypotheses about how they apply to the behaviour you are seeking to change over a period of time. The GSR Review[51] has a detailed section on theories of change, some insights from which appear in section 1 of this document.

It is also important to remember that when we talk about 'behaviour change' we are really looking at two distinct areas: behavioural theory and change theory. A practical behavioural model should reflect the importance of changing, as well as explaining, behaviour. But while a model should incorporate some change theory, its main purpose should be to understand the behaviour and its influences. However, as we move on to look at creating a communications strategy (that is, how we can use communications to help change the behaviour), change theory becomes more important.

Change theory and change modelling tend to be generic and rarely seek to explain how behaviours differ from each other in terms of the way they change. So when using change theory in creating communications models, it is vital to keep the specific behaviour that you are trying to change in mind. If we lose sight of the behaviour or behaviours we are seeking to change, we will lose most of the benefit of applying the theory.

Unlike many behavioural models (which seek to explain the influences on people's behaviour), change models work over time and in stages. The aim is to provide a strategy for moving people from one stage to the next. In practice, people rarely move in a neat linear pattern. Rather, they move forward, sometimes in jumps, and relapse, often several times.

There are a number of examples of campaigns where a behaviour change model has been developed from change theory only. For example, the original Tobacco Control communications strategy was based on Prochaska's Stages of Change model (see page 36). However, in testing the model, the Department of Health found that a deeper understanding of the factors influencing behaviour needed to be made more integral to the process.

51 Darnton A (2008) *GSR Behaviour Change Knowledge Review. Reference Report: An overview of behaviour change models and their uses,* HMT Publishing Unit, London.

There are also plenty of communications strategies (in the widest sense of the term) that use change theory but that are based on practical marketing experience rather than academic theory. Often, in practice, the theory is the same and only the language is different; however, there are a number of terms that are used interchangeably but which actually have quite different meanings.

For example, the terms 'behavioural change journey' and 'customer journey' are sometimes used interchangeably. However, these are two very different things. The behavioural change journey outlines the stages involved in a change of behaviour (for example, in Prochaska's model, from pre-contemplation to contemplation and so on). A customer journey is the experience or series of experiences that a citizen has with a service or brand on the way to a specific output – for instance, the number and type of contacts they have with a government department or agency before receiving the benefit they have applied for.

Segmenting the audience on the basis of change

While some change models (such as the Stages of Change model, see page 36) are based on audience segmentation, generally they allow for the fact that, even within specific behaviours, the extent to which people want to change varies greatly. This means that they can be classified into different groups or stages. Segmentation not only helps to define groups; it can also help to determine the most effective action for each group.

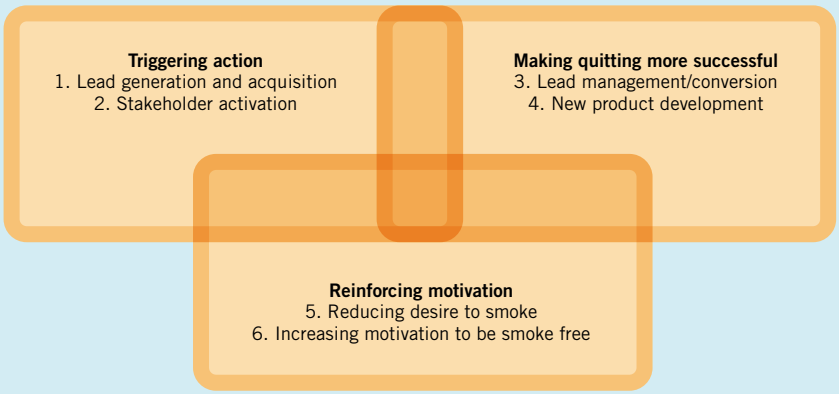
We have already suggested that target audiences may need to be segmented in order to understand their behaviour. Now, we are suggesting that each behavioural segment should be further sub-divided according to how willing (and able) its members are to change their behaviour and what help they need to bring that change about.

Prioritising barriers and triggers for change

Even where the behaviour we are seeking to influence is homogeneous across the target audience (for example, paying the congestion charge) we will need to look at how communications can help to support the desired change. That will mean identifying and prioritising the barriers and triggers associated with the behaviours as well as assessing their relative weight. Because most behaviours are influenced by multiple factors, and people will be at different stages of behaviour change, you will almost certainly need to develop a range of communications targeted at multiple triggers and barriers in order to bring about change.

Setting goals and evaluating success

KPIs and plans for evaluating communications should be developed alongside and be based on the communications model. Change to the factors that the communications are seeking to influence should be evaluated at each stage, and the results used to adapt both the communications



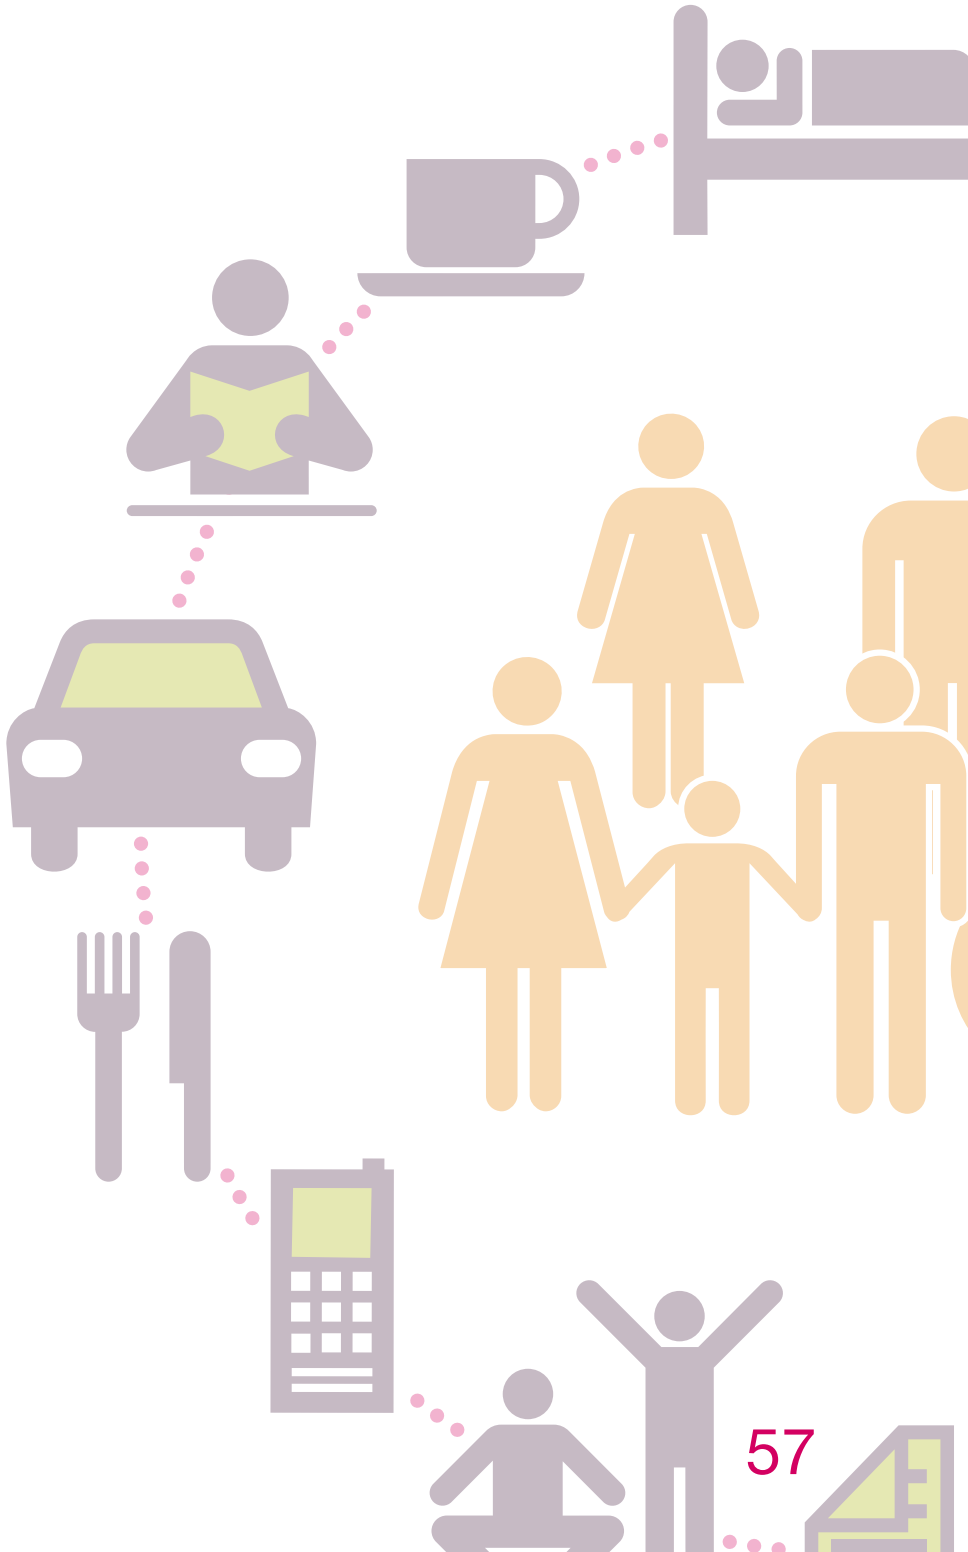
themselves and the applied behavioural and change models that you have developed. This is integral to the process and will enable you to maximise the efficiency and effectiveness of your communications much more accurately.

The evaluation plan should be approached with as much care as the other steps in this process. Influencing behaviour is a complex task, so it is important to learn as much as possible both about what works and what doesn't work so well. A typical evaluation plan will be based on a consideration of behavioural insights, the change process, communications objectives and activity, and how best they can all be measured and understood.

Step 5 in practice: the Tobacco Control campaign

A simple model was used to drive the shape of the overall strategy. This identifies three marketing objectives and, within these, a number of different workstreams for communication. (Continued over)

Marketing objectives and workstreams



Step 5 in practice: the Tobacco Control campaign

A wide range of KPIs have been defined in order to enable the Department of Health to monitor all aspects of the strategy (see next page). The KPIs reflect the defined marketing objectives and the way in which communications are expected to influence behaviour.

Triggering action	
Business KPIs	Percentage of smokers making a quit attempt in any given year Percentage of smokers making a quitting-related action in any given year Percentage conversion of quitting-related actions to quit attempts
Marketing KPIs	Percentage of smokers making a quit attempt in any given year triggered by Department of Health marketing activities Percentage of smokers making a quitting-related action in any given year triggered by Department of Health marketing activities Volume of centrally generated valid responses for NHS support Volume of centrally generated active responses for NHS support Quality of centrally generated responses (percentage intermediate conversion) Cost per valid/active response
Making quitting more successful	
Business KPIs	Volume of quitters using NHS support Percentage of smokers using NHS support to quit (market share)
Marketing KPIs	Salience (spontaneous awareness) of NHS support Percentage of smokers believing that NHS support is the most effective way to quit Understanding of the different types of NHS support available User imagery associated with NHS support Quit rate among customer relationship marketing (CRM) participants vs control Intermediate conversion among CRM participants vs control Advocacy/net promoter score for NHS support
Reinforcing motivation	
Business KPIs	Claimed motivation to quit Smokers' perceptions of smoking prevalence among general population Increase in the proportion of smoke-free homes
Marketing KPIs	Awareness and understanding of negative consequences of smoking Emotional engagement with communication Fame/talkability/word of mouth impact of communication Perceived relevance of negative consequences to themselves or their family Image of non-smokers and ex-smokers Perceived impact of communication on desire to quit

The first year of the new strategy has seen improved overall quit results, with a particularly large increase in online response and engagement. The statistical model predicts that marketing activity has resulted in 1.3 million quit attempts and 95,000 successful quits in 2008/09, while econometric modelling for 2009/10 predicts over 2 million quit attempts and 160,000 one-year quits as a result of social marketing activity.

CONCLUSIONS AND FUTURE IMPLICATIONS

This document is intended to stimulate debate about how communications can most effectively influence behaviour, and to contribute to our overall goal of helping to develop ever more effective and efficient government communications. Here we summarise our conclusions and look at some of the implications for government communicators.

Applications for communications development

The starting point for effective communications should be a deep understanding of human behaviour and how to change it. Behavioural theory has a key role to play in helping us to understand why people act in the way they do. We have focused on social psychology and behavioural economics, two disciplines that have become more accessible in recent years, but we recognise the need to cast the net wide to capture valuable learnings from other relevant theories. In future, our aim will be to develop our thinking and practice in this area so that we draw from the full range of insight into human behaviour and apply it to the development, delivery and evaluation of communications.

Understanding behaviour and its influences should be based on a combination of theory, primary research and existing understanding and experience. To provide the best behavioural insights we need to employ the most appropriate tools and techniques and synthesise across the range of sources. What we have learnt in practice is that we don't always have the time or budget to work through the steps outlined in our process in as much depth as we might like. However, this should not preclude the use of the process in a pragmatic way, building up a deeper understanding of the behaviour and its influences as our communications develop.

Creating a single practical behavioural model for each behaviour change programme will enable a consistent approach. We believe that using a team of relevant experts to create one model that is used by all of those involved in developing and delivering activities to support behaviour change has a number of advantages. It allows us to develop and share a common understanding and language throughout the whole process. It also provides a framework on which the communication strategy can be built and implemented, alongside the range of other interventions. In the longer term, it can be a unifying platform across policy and communications.

Communications should not be viewed in isolation. By taking a holistic view of all interventions it becomes easier to identify the role for communications and help inform budgeting decisions, by pointing to where communications can have the biggest impact.

Developing a practical behavioural model can help make communications more effective at influencing behaviour. Such models allow us to drill down into the ecology of influences on people's behaviour and provide us with the tools to work more efficiently and effectively at changing it. Models should also help us to better identify realistic communications objectives targeted at specific factors that contribute to the behaviour, and to identify a role for communications that complements and supports other interventions.

Communications can work on many levels. The case studies we have chosen illustrate campaigns that have explicitly drawn on behavioural theory. They show that communications can perform a range of different functions, from reframing an issue, to promoting normalisation, to building up people's belief and confidence in their own ability to change.

Future implications for communications development, delivery and evaluation

Understanding behaviour will support more robust and meaningful evaluation. A deep understanding of the behaviour(s) you are seeking to change should lead to a clear understanding of the role that communications can play and to the establishment of specific and realistic objectives. This should in turn enable you to develop a focused evaluation plan which sets relevant key performance indicators and measures that explicitly relate to the factors that communications are seeking to address. The plan should set out the methodologies and techniques required to test, refine and validate your initial hypothesis.

Evaluation should be ongoing. Given that the process of developing communications designed to bring about behaviour change will necessarily be an iterative one, evaluation should also be ongoing. By evaluating behavioural and change models and activities at each stage, we can test our original hypotheses and either validate or adapt them as necessary. This should in turn yield valuable insights as to what is and isn't working and why. Communications should be evaluated with consideration of all interventions and influences on behaviour, so that the contribution of communications can be clearly understood.

Understanding behaviour and its influences will enable us to harness the most efficient and effective communications channels. The spread of new technologies and the proliferation of content and communications channels mean that we have more tools at our disposal than ever before. It also means that we need to look at communications in new ways and, as emphasised throughout this document, alongside the factors that influence the behaviour we are seeking to change.

- **Earned opportunities in the form of trusted experts, such as family, friends and social media contacts, are an important resource.** People look to those around them to guide their behaviour and support them through change. For communications, this area has traditionally been the preserve of PR. However, the internet creates powerful new opportunities, including blogs and user-generated content, which can be effective channels for facilitating social proof and peer group support.

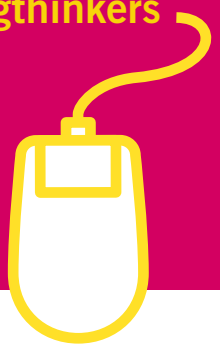
- **Owned communications opportunities delivered via your own assets, such as call centres, websites or outreach programmes, will have a significant impact on the way people experience your brand or service.** Such opportunities can also provide a useful way of offering the face-to-face or personal encouragement that is such an important part of the behaviour change process. They can also be useful in cases where people need to experience the behaviour before their attitudes can change.
- **Paid-for media opportunities (which traditionally account for the biggest part of the government communications budget) are not always the most trusted sources.** Such opportunities provide effective channels for information and persuasion but are not always the most trusted or listened-to sources. Consideration should be given to how these work together with the earned and owned opportunities, within the ecology of influence on people's behaviour.

How we conceive and develop campaigns and propositions will also need to be reframed by a deeper understanding of how to deliver the role of communications within the practical behaviour change model. It is apparent that we increasingly need to understand holistically how all the triggers of change can be harnessed together and, within that, how we re-purpose communications to seed, start or simply nudge a wider narrative among our audiences while planning for its effects alongside those of the other interventions. In this context the implication is for a shift away from discrete campaigns and towards multiple messaging and propositions that stimulate ongoing relationships with the distinctive groups we need to engage for sustained and successful behaviour change.

There is scope for further exploration of the role that brands can play within behaviour change campaigns. This will help us to make more informed decisions as to when a brand can be used to support behaviour change, and to incorporate an understanding of the behaviour and its influences into the development of the brand architecture and positioning.

NEXT STEPS

There is still considerable scope to further explore the implications of embedding behaviour change theory in the development of communications.



The following questions provide a flavour of the kinds of areas we are currently considering:

- **How do we best encourage this emerging thinking and practice to become a widespread and common language that is understood and applied by all of those involved in supporting behaviour change?**
- **How do we ensure that we keep abreast of theoretical developments?**
- **How do we ensure that all of those involved in the development of communications are trained in understanding theory and applying it to their work?**
- **How do we get better at applying theory through the communications process? What are the best tools and techniques to use at each step?**
- **How do we best learn from and share our experiences, so that we can gain a better understanding of the factors that influence behaviour across government initiatives and of the most effective way of addressing them?**
- **How do we ensure that we make effective use of research, combined with theory, to help us better understand behaviour?**

We hope that this document will launch the debate and mark the start of an ongoing dialogue that will lead to better practice and more effective government communications. We are in the process of developing a programme of work to take this thinking further.

Please go to **http://coi.gov.uk/blogs/bigthinkers** if you would like to join the debate.

APPENDICES

APPENDIX 1: The five-step process

Step	Key questions	Outcomes	
Step 1 Identifying behaviours	• Are we addressing single or multiple behaviours? • How do we break down the issue into its component behaviours? • How do multiple behaviours relate or group? • Who do we want to undertake the behaviour? • What is the desired and current behaviour? • Does the behaviour involve people starting, stopping, maintaining or preventing?	Agreed target behaviours	Exploration
Step 2 Understanding the influences by audience	• **Personal:** – What are the attitudes, values and beliefs of the target audience? – Is there a gap between attitudes and behaviour? – Are people aware of the need to undertake the behaviour? Is the requirement known to them? – Do they have the knowledge to undertake the behaviour? – Is the behaviour habitual or one-off? – Are people confident about undertaking the behaviour? – If people do undertake the behaviour, will the outcome be beneficial to them? – What emotions are involved in the current and desired behaviours? – What biases/heuristics might be at play? • **Social:** – Is the behaviour in line with or against social norms? – Is peer pressure likely to be an influence? – Who will influence them, and how strong will their influence be? • **Environmental** – What factors influence them at the local and wider environmental level (access, price, opportunity, services and proximity)? • How do factors differ across audiences? How does their importance vary across different audience groups?	Detailed understanding of all influencing factors	
Step 3 Developing a practical model of influences on behaviour	• How do we prioritise the factors identified at step 2? • How do these factors influence current and desired behaviours? • What is the relative importance of the factors? • Do we have data to measure the factors? • Can we build a data-driven model? • If we can't, what are the pragmatic hypotheses we can work with and test? • What are our early hypotheses about how behaviour might change? • What are our early hypotheses about the role that communications might play?	• Model of key influencing factors • Understanding and/or measurement of how the factors work together and their importance • Initial hypothesis about role of communications	Towards a solution
Step 4 Building a marketing framework	• What factors will marketing/interventions need to target? • Where will communications play a role? What factors will they affect, and how? Will they play a leading or supporting role? • What are the communications objectives? • What are our top-line evaluation metrics for these communications objectives?	• An understanding of the role of communications and the factors they are designed to influence • An agreed set of communications objectives • How communications fit into the wider picture • Top-line metrics for setting and evaluating key performance indicators	
Step 5 Developing a communications model	• Does everyone involved understand the role communications can play and the factors they are aiming to influence? • How do we expect communications to influence people's behaviour over time? • What are the key triggers and barriers at each stage of our change journey? • How will communications influence these? • Where do communications fit in with the marketing framework? • How do we evaluate each stage of the change journey? • How can we use our learnings to adapt our applied model? • How can we use our learnings to adapt our hypothesis?	• A communications model • An understanding of whom communications are targeting and where communications fit into the overall picture • An evaluation plan and matrix

APPENDIX 3: Acknowledgments

In creating this document we have drawn on the expertise of a number of people from government, academia, industry and COI. Inclusion in this list does not imply formal approval by these organisations or individuals of the content of this document. We would like to thank:

- colleagues from government departments and agencies including the Learning and Skills Council, the Department for Children, Schools and Families, the Department of Health, the Department for Environment, Food and Rural Affairs, HM Revenue & Customs, the Department for Transport, the Department for Work and Pensions, the Home Office, RAF Careers, the Health and Safety Executive, the Electoral Commission, and industry and COI colleagues who spoke to us about their approach to developing behaviour change strategies;
- experts in the areas of communications and behaviour change who attended workshops at COI and/or who peer reviewed this document: Will Collin, Andrew Darnton, Mark Earls, Daniele Fiandaca, Alison Hoad, Robert Horler, Steve Morris, John Owen, John Poorta, Stuart Sullivan-Martin, Charlie Snow and Kate Waters;
- the Government Social Research Unit, in particular Anna Richardson and those involved in the GSR Behaviour Change Knowledge Review, with whom we have worked closely to develop a common understanding of behavioural theory and models;
- the Department of Health, the Department for Children, Schools and Families, the Department for Transport, the Home Office and Peterborough Environment City Trust for providing case studies of behaviour change campaigns; and
- the Cabinet Office with which we've worked closely throughout this project.

Their contribution has been invaluable in helping shape our thinking and to produce this final document.

This document was written by the Behaviour Change and Communications team: Mairi Budge, Clare Deahl, Martin Dewhurst, Stephen Donajgrodzki, and Fiona Wood.

If you have any further enquiries,please email behaviourchange @coi.gsi.gov.uk

COI is the Government's centre of excellence for marketing and communications.

We work with the Government and public sector to inform, engage and influence people about issues that affect their lives.

However complex or specific your communications challenge, COI will help you find a solution. To discover how you and COI can work better together across a range of marketing and communication areas, contact us now.

Geoff Mulgan

Since late 2004 Geoff has been director of the Young Foundation.

The Young Foundation combines research; practical projects in dozens of localities; creating new enterprises in the public, private and third sectors; and coordinating a global network of organisations engaged in social innovation.

Between 1997 and 2004 he worked in various roles in the UK government including director of the Government's Strategy Unit and head of policy in the Prime Minister's office.

Before that he was the founder and director of the think-tank Demos and chief adviser to Gordon Brown MP. Geoff has advised many governments around the world and is a part time adviser to Australian Prime Minister Kevin Rudd; a visiting professor at LSE, UCL, Melbourne University and the China Executive Leadership Academy; on the boards of the Work Foundation and the Design Council; and chair of Involve and of the Carnegie Inquiry into the Future of Civil Society.

Foreword

Persuading people to adopt healthier behaviours has become a central theme of modern public health policy. It underpins the goal of making the NHS more of a health service rather than a sickness service. Yet it is rarely easy. Most of us do things that damage our health. And most of us have habits that we would like to change.

The question I was asked to address in this report was what is known about what works in changing behaviour. To answer the question we looked at insights coming from the many fields concerned with behaviour – from commercial advertising to the latest academic insights from behavioural psychology. It was soon clear that this is as much an art or craft as it is a science. There are many promising ideas, and there are some success stories. However the evidence base is thin. Behaviours can change in fundamental ways – but usually through the interaction of incentives, information, peer pressures and changes to the environment, rather than because of any one set of measures.

Some of the lessons suggest the need to shift direction. For example, we are increasingly learning about the importance of networks in shaping how people behave (whether its obesity or smoking), and how behaviour can be changed. Who you know shapes how you act. This suggests the potential for much more targeted action rather than mass advertising. Other lessons are about the tone that communications should adopt. Sometimes very stark messages are unavoidable. But against a backdrop of huge volumes of communication, it's important to be economical, and often more can be achieved by positive messages, that emphasise personal wellbeing rather than just stoking fears.

Behaviour change also requires some changes of emphasis for the NHS. Because the hard evidence base is so thin, there is an urgent need for faster experiment, with robust evaluation and faster learning. We badly need better knowledge about what works, and at what cost. We also need better collaboration since the NHS can directly influence only a small proportion of public behaviour. Others need to be partnered with, including local authorities, the media and retailers.

This report is a snapshot of a field that is evolving rapidly. I'd like to thank the many experts who gave generously of their time and who are themselves advancing knowledge on so many fronts. I hope that this report does justice to their insights.

Executive Summary

We know that people care about their health. We also know that around half of all illness is linked to choices people make in their everyday lives – whether that is the choice to smoke, drink excessively or eat too much and exercise too little. For this reason, governments have increasingly focused on helping people to make different choices. But people don't smoke or drink too much because they are ignorant, stupid or perverse – rather, it is the combination of the enjoyment that they get from these things and wider social or other environmental factors that mean they find it hard to adopt healthier behaviours.[1] A key challenge for the Government, therefore, is how best to use scarce taxpayer resources to help people make the right choices for them.

The challenge I was set in writing this report was to build on current approaches, using the latest evidence from areas such as behavioural economics and psychology, to suggest ways in which the Government could become more effective in this area, to help people to make healthier choices where they wish to do so.

In support of this work, we carried out three main tasks:

- a literature review and initial discussions with some key practitioners and academics;
- two seminars with a wider group of experts in the field, drawn from academia, local and national government, business and the third sector; and
- qualitative research to investigate the public's views of their own experiences and the Government's role in behaviour change. Selection of participants was based on a segmentation model developed specifically by the Department of Health (DH Healthy Foundations Life-Stage Segmentation Model – see Annex A for more details).[2]

The key themes to emerge from this process are:

- the need, in our messages on public health, to put more emphasis on the positive, in particular how people can feel better by changing their behaviours;
- to speed up experiment, with faster learning, in order to develop as rapidly as possible the robust evidence base needed to underpin more effective behavioural interventions;
- linked to this, the necessity for the Department of Health to orchestrate its own knowledge to ensure that it remains on top of the rapidly evolving evidence base on behaviour change, segmentation and the design of environments;
- that the most powerful tools involve reshaping environments to encourage people to make healthier choices, while still leaving open the option of choosing differently;

1 Our interest here is in how public behaviours can be changed from the relatively damaging to health to health promoting. In most cases there is a broad distribution of behaviours. There are two overlapping goals for policy: to shift the average, and to reduce the extremes of harmful behaviour. guidance.nice.org.uk/PHG/Published

2 DH Healthy Foundations Life-Stage Segmentation Model: www.dh.gov.uk/en/PublicationsandStatistics/Publications/PublicationsPolicyandGuidance/DH_090348

- that only a small part of behaviour change is under the control of the Department of Health or the NHS, so it is vital to mobilise partners in the media, business, local authorities and across central government; and
- that leadership – including by ministers – is crucial. Messages which show key leaders walking the talk, together with honesty about the difficulties of changing behaviour, are a vital complement to other types of message.

Given these key themes and principles, my immediate recommendations are:

i. First, public campaigns will continue to play an important role, but will not have a uniformly strong impact across all groups in society. And to succeed against a backdrop of the huge volume of messages being sent to people, messages and tone that are perceived as paternalistic or patronising are likely to be less effective than those seen as more supportive; they should, in broad terms, put more emphasis on the positive than on the negative, and in particular on how people can feel better by changing their behaviour. Sometimes it will remain necessary to challenge and even shock people – and, at least in the case of smoking, negative messages can be more useful in relation to why to quit, with positive messages being more important in relation to how to quit. But messages of this kind need to be used sparingly.

ii. Second, while the current evidence base makes it difficult to make many immediate recommendations on specific programmes, one area where this is possible is to extend financial incentives for pregnant mothers to quit smoking, drawing on current successful pilots in Dundee and Birmingham.

iii. The fine grain detail of how environments are shaped is becoming increasingly important to health. An important challenge for the future will be to ensure more people involved in policy and service design have a feel not only for the evidence on behaviour change but also for the details of successful service and physical design.

iv. Fourth, in relation to mobilising partners, there are a number of positive examples of good practice which should provide ideas on similar approaches across health improvement work. For example, the Food Standards Agency and Department of Health are working with the food industry to:

   – pilot calorie labelling on menus and menu boards to help consumers at the point of choice;

   – push for agreement with manufacturers on smaller portion sizes (e.g. of chocolate bars and soft drinks); and

   – rebalance the advertising and marketing of food to children to reduce their exposure to promotion of food high in fat, salt and sugar and increase their exposure to promotion of healthier options.

   Other government departments also need to be mobilised – for example, as has happened with HM Revenue & Customs (HMRC) on tobacco smuggling, and in joint working with the Department for Children, Schools and Families (DCSF).

v. Fifth, the Olympics provide an ideal catalyst for a more ambitious approach to area-based projects – for example, challenging major towns and cities to compete to transform their fitness and overall health and wellbeing. Nowhere in the UK has yet attempted a comprehensive strategy to boost exercise levels, yet the time must be ripe to do this. There is also a key role for political leadership to encourage people to be aware of the conflicting messages coming to them, more of which tend to encourage overeating or drinking than the reverse. This may not be the place for regulation and law, but major businesses could be much more vigorously held to account for the messages they send, particularly to children.

vi. Sixth, although I recognise the range of competing priorities, ideally more health research would be focused on behaviour change. Despite some very strong evidence – collated by NICE among others[3] – on the effectiveness and cost-effectiveness of *some* behaviour change methods, the great majority have not been adequately studied or measured. Public and private investment in health research is overwhelmingly skewed towards clinical solutions rather than the ones described in this report (only around 2% of the health research budget goes to prevention).

3 guidance.nice.org.uk/PHG/Published

The Structure of this Report

This report starts by considering, in Section 1, some of the latest evidence from behavioural psychology and economics, before looking, in Section 2, at the range of tools available to government policy makers to influence behaviour change. I then use this in Section 3 to assess the efficacy of some past and present approaches, and set out in Section 4 some potential ways to build on successes, looking at the form and tone of public health messages, as well as the role of other organisations (both inside and outside government). In Section 5, I consider the views of both the public and front-line professionals – based on our Customer Insight research – before reaching some conclusions and setting out my recommendations in Section 6.

Introduction

Few of us find it easy to change long-standing habits even when we know that they are no good for us. Many people who smoke, drink or eat too much know that they shouldn't.[4] Many others do so despite their best intentions.

But all governments are under intense pressure to get better at influencing public behaviour – both to make it easier for us to make 'better' (including healthier) choices where we wish to do so, and to take action to prevent others making choices which impact negatively on our welfare. We have abundant evidence on the cost of bad behaviour for the taxpayer and society as a whole. And, when it comes to health issues, we know that the only way to arrest worsening obesity is through changes to habits of exercise and diet which many of us will find very challenging, even though they may only need to be relatively small.

Governments have extensive powers to influence behaviour – from law and education to regulation and taxation. But these are exercised within the context of emerging public views on what is legitimate. While government has an important role in shaping public perceptions, there is understandable nervousness about being too explicit, or too draconian. It took nearly 50 years for governments to gain the legitimacy to impose smoking bans. Many people view these types of behaviour as matters for private life, not public legislation. It could be argued that, in the past, government communication was sometimes paternalistic or even patronising, which in some cases backfired, encouraging those people to reinforce their behaviour as a way of asserting their independence and identity.

These anxieties have been compounded by the lack of hard evidence on what works. Despite some partial success stories, such as campaigns against drink driving or encouragement to eat more fruit and vegetables, the evidence base on behaviour change is thin and uneven. NICE has shown the effectiveness of, for example, smoking cessation programmes. But a report produced last year on the cost-effectiveness of public health interventions confirmed just how little is known about what works.[5] What we do know is that:

- Information and education are disappointingly ineffective tools for persuading people to change behaviours.
- Rational persuasion has relatively little impact on entrenched habits, particularly if they involve strong peer pressures or even addiction. This is why the lessons from commercial marketing are of only limited use – the great majority of advertising is aiming at marginal shifts in choices (e.g. between different washing powders) which aren't remotely comparable with trying to persuade someone to quit after 20 years as a smoker.
- There are some pointers to more effective interventions – e.g. engaging people on alcohol treatment when they are coming out of an incident at A&E. But we don't know yet what other tools will work best and in cost-effective ways.

4 Smokers and overeaters may be more aware of the harm they're doing than heavy drinkers, many of whom think their behaviour is normal.

5 Matrix Evidence/Bazian (Oct 2008), *Prioritising investments in public health*. www.healthengland.org/health_england_publications.htm

Section 1 What Can We Learn From Behavioural Psychology and Economics?

Key messages

- The fields of behavioural psychology and economics are still developing, but do provide many useful insights into behavioural change. Integrated theories of behaviour change, such as West's PRIME model, can be used, if not to design whole intervention programmes across a range of health behaviours, then to test policy ideas even before they are piloted.
- The most effective behaviour change interventions will address all, or most of, the points made above, through a variety of routes – it is not enough to design interventions which are aimed at one or even a few of these areas.

In recent years there has been a good deal of effort to learn more about why people do and don't change their behaviour. An earlier overview of the state of the field was undertaken by the Prime Minister's Strategy Unit in 2002. The award of the Nobel Prize for Economics to Daniel Kahneman significantly raised the profile of behavioural economics, and more recently Cass Sunstein and Richard Thaler's *Nudge* became a best seller.[6] At the same time, the Department of Health has drawn on various other theoretical models, such as Robert West's PRIME model of behaviour change,[7] to guide its work. The best research has drawn on observation of how people really do behave, rather than deducing conclusions from theories (such as economic theories of how people might respond to incentives).

6 Thaler RH and Sunstein CR (2008), *Nudge: Improving decisions about health, wealth and happiness*, Yale University Press.

7 See www.primetheory.com

There are several main insights from this body of work which are now widely accepted, even if the experts differ on the precise mechanisms (the range of views is described in more detail in Annex B). All of these show why traditional public information campaigns rarely succeed on their own.

i. The first is that people use **rules of thumb** ('heuristics') to help them make decisions, which are not strictly rational.

ii. People also tend to **overdiscount the future** – for example, putting too much weight on the pleasures of excessive drinking now, against the risk of the potential health problems that could result later in life (or even the risk of being injured in a fight or accident on the way home from the pub).

iii. In addition, **we tend to pay more attention to potential losses than gains**. As a result, for example, we are more likely to change a behaviour if told of the increased risk which would result if we fail to act, than if told of the reduction in risk that would result from change. As with rules of thumb and overdiscounting, it's very difficult to go against the grain of this natural tendency.

iv. People make decisions using both their rational conscious brain and their 'automatic processing system', the parts of the brain that **make decisions unconsciously or subconsciously**. The most powerful interventions address both.

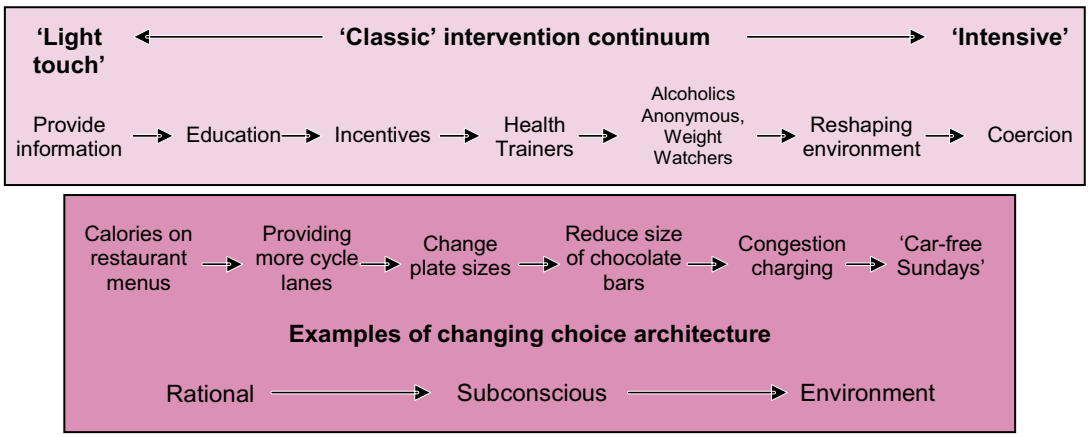
v. How we behave is influenced by **contexts and by 'choice architectures'**. A teenager may know about contraception but push that knowledge to one side when drunk. When trying to change habits, such as smoking or excessive drinking, people often need personalised plans that help them think through how to deal with difficult situations, e.g. social occasions, where they are used to smoking or drinking excessively. Similarly, the precise context in which choices are made can be important – people can be 'nudged' towards better choices through everything from portion sizes in cafeterias to making particular kinds of pension the default option.

vi. Behaviours are bound up with **identities**. If being able to 'hold your drink' is part of someone's social identity, they will need an equally powerful identity, with which they can strongly identify, to replace it if they are to change their behaviour (e.g. perhaps as a responsible father).

vii. There is now strong evidence that phenomena such as obesity are heavily influenced by **networks and relationships**: who you know shapes how you behave. Behaviours can spread rather like viruses. Equally, we're more likely to change if we think it matters to someone who matters to us, or if there is a group to help us (like an Alcoholics Anonymous group for example).

viii. For all the above reasons, what works with one group won't with another. **Segmentation** and targeting are all-important. Methods for changing behaviour need to be aligned with cultures, cognitive styles, social contexts etc. In relation to alcohol, for example, some groups may be most influenced by messages about long-term harm, while others may be more influenced by self-image and the perceptions of others.

ix. Changing the **environment** in which people live and work is often the most powerful way of influencing their behaviours. For example, where the social norm is to smoke, it is harder to be a non-smoker. Banning smoking, however, obviously has a big impact.



While innovative policies are building on some of these ideas, these insights have not yet been fully incorporated into policy – perhaps understandably because many of these insights are relatively recent. Some of the tools that are described in the next section remain underdeveloped. For example, segmentation methods, which divide up the population by lifestyle or culture, are not much more than 30 years old, but remain far from an established science. Nevertheless, we can map the different types of policy tool that can be used, and relate them in a rough and ready way to the state of knowledge.

Section 2 The Intervention 'Toolkit'

Key messages

- There is a wide range of interventions open to government to help people change 'unhealthy' behaviours, but its ability to move towards the more interventionist end of the spectrum is constrained by public perceptions of legitimacy.
- In between information provision – which tends to be insufficient on its own to deliver behaviour change – and more interventionist policies, there are some promising potential policy routes, including ensuring that information is delivered to people in a form that is salient to them, and changing the environment in which people make choices (e.g. portion sizes). Interventions built on one-to-one relationships – such as the Family Nurse Partnership (FNP) programme – also look like a promising route forward. But these will tend to be resource intensive and may, therefore, require careful targeting.
- Current evidence would not support the extensive use of financial incentives to support behaviour change. But emerging evidence from work to help expectant mothers stop smoking suggests that they may be useful in that, albeit limited, context.

The diagram below sets out the range of options available to policy makers in designing interventions aimed at supporting people to change their health-related behaviours. These are shown as forming a rough continuum. Lighter touch interventions are on the left and more 'intensive' or 'intrusive' interventions on the right. Interventions aimed at changing the 'choice architecture' or environment can also be arranged along a similar intervention spectrum.

Here I comment briefly on what is known of the efficacy of each set of tools.

Information provision

Information provision is seen as the most legitimate form of intervention by the state, since it leaves the maximum room for choice for the individual. However, experience has repeatedly shown that information and education, while necessary conditions for behaviour change (at least in terms of laying the groundwork for further action by government), are relatively ineffective at supporting behaviour change on their own.[8]

It has also been shown that the form in which the information is provided matters. One interesting example is the publication by the Australian Government of the table below, showing the risk of death resulting from different levels of daily alcohol consumption.

On its own, this information may allow some people to judge their preferred level of alcohol consumption. But one of the key messages from the Customer Insight work we commissioned was that people did not readily understand statistics – in this case, what might be seen as a reasonable risk? What the Australian Government has done is to base its recommended daily alcohol consumption at 2.5 UK units, using the comparable lifetime risk of dying in a road traffic accident as the comparator by which to judge this limit. This provides some salience to the limit chosen – it gives people a useful benchmark for assessing risks.

8 For example, see Gilmore I (2006), What lessons can be learned from alcohol control for combating the growing prevalence of obesity? *Obesity Reviews* (2007) 8 (Suppl. 1): 157–60, on the case of alcohol and drinking behaviours.

Lifetime risk of alcohol-related death, drinking a certain amount daily (men)[9]

Number of Australian units of alcohol consumed per day	Total risk of alcohol related death	Death from alcohol related disease	Death from injury
1 (= 1.25 UK units)	0.4%	0.2%	0.2%
2 (2.5 UK units)	0.9%	0.4%	0.5%
3 (3.75 UK units)	2.8%	1.3%	1.5%
4 (5 UK units)	4.2%	2.0%	2.2%
5 (6.25 UK units)	5.8%	2.7%	3.1%
6 (7.5 UK units)	9%	3.8%	5.3%
7 (8.75 UK units)	12.2%	4.7%	7.5%
8 (10 UK units)	14.8%	5.1%	9.7%

What might make this table more useful would be to provide similarly salient examples of equivalent risks for other levels of alcohol consumption, for example the risk associated with riding a motorbike, horse riding, or other everyday decisions with which people could easily identify. While this could be accompanied by a government recommendation – aimed at those audiences who want it – it would enable others to make a decision based on the level of risk they are normally prepared to take in other aspects of their lives, and therefore improve the effectiveness of information provision as an intervention.

This assumes, of course, an approach to decisions (in this case, about drinking) that probably doesn't reflect most people's actual approach (which is, for example, likely to be driven by such things as habit, social context and what friends are doing). But it is undoubtedly part of any more comprehensive strategy, and might particularly help those who have reached a point where they want to take more active decisions about their overall level of a particular behaviour.

9 Australian National Health & Medical Research Council (2009), *National Guidelines to reduce health risks from drinking alcohol*, 48. Interestingly, this is combined with advice recommending that Australians should consume no more than 5 UK units on any single occasion – again, this makes the advice more salient, as it reflects many people's usual drinking patterns, where they may have a few drinks socially on some days and drink little or nothing on other occasions.

Choice environment

Moving right along the intervention continuum, we come to ways of changing **people's choice environment**, making it easier to choose 'healthier' options without preventing people from making less healthy choices if that is what they want. Examples of this include the recent proposal by the Food Standards Agency (FSA), working with the confectionary industry, to reduce slightly the size of chocolate bars.[10] This will reduce the calorie intake of those who want a one-off treat, without impinging on the freedom of those who want more to buy another chocolate bar.[11] This builds on an important lesson from behavioural psychology/economics about portion size – that people will tend to eat what's put in front of them, so that reducing portion size can have an impact on calorie intake and, eventually, obesity. Other examples include much greater provision of safe bicycle lanes (as in many countries); restricting the numbers of fast food outlets; or preventing 'happy hour'-type alcohol promotions as a condition for licences.

Building relationships

The next set of tools involves relationships – either one-to-one methods or the mobilisation of peers. A good deal has been invested in health coaches and health trainers, with some promising early evidence (though as in so many cases, the assessment has been designed in ways that make it hard to judge cost-effectiveness). In the private market, spending on personal coaches and counsellors has grown massively in recent decades, providing pointers to where demand may be heading more generally. People often like to have an external pressure – challenging but sympathetic – to help them to do the things they want to do anyway.

At the other end of the social spectrum, the **Family Nurse Partnership** (FNP) programme is another example of such an approach, which relies very heavily on the development of one-to-one relationships between the nurses and the families with whom they work. **Significant resources have been targeted at a relatively small population, and the benefits run much wider than health**.

For other individuals, however, being part of a mutually reinforcing group may be the key to behaviour change – the **peer-to-peer** elements of WeightWatchers and Alcoholics Anonymous are clearly key components of those approaches. A good deal of work is underway on potential ways of linking people with long-term conditions into clubs which could encourage mutual support for condition management and healthier behaviours. Recent evidence shows that obesity is strongly influenced by social networks – you are more likely to be obese if someone you know is, and even if someone once removed is. One-to-one support is part of the toolkit for reversing these flows of influence, mobilising social networks in the other direction.

10 news.bbc.co.uk/1/hi/health/8173936.stm

11 It could be argued that consumers' utility will be reduced because there is unlikely to be a price cut corresponding to the reduced size of a chocolate bar. On the other hand, this is relatively trivial compared with the costs associated with other, more intrusive interventions.

Financial incentives

A stronger form of intervention is to provide **financial incentives** to encourage people to adopt healthier behaviours. The newly established Centre for the Study of Incentives in Health (CSI Health)[12] has launched a programme to assess the long-term impact of such incentives. However, as well as being unpopular among the public (who tend to argue that they unfairly reward people for 'bad' behaviours), current evidence suggests that the impact of such incentives may be limited to the short term (just as most performance-related pay schemes tend to diminish in effectiveness over time). While this could be simply a design issue (the level and nature of the incentives offered, as well as their timing, clearly matter), it is hard to argue for their widespread use on the basis of current evidence.[13]

A more positive example – and perhaps an exception to that general rule – comes from a successful experiment carried out in Dundee, where expectant mothers were paid relatively small sums – £12.50 in the form of a credit on an electronic card, which could be spent on groceries at the local supermarket (excluding alcohol and cigarettes) – if they stopped smoking. In a positive assessment of the pilot, researchers found that an important reason why the incentive worked was 'that using rewards gave mothers an excuse to opt out of the social norm of smoking within their peer group, but, crucially, did not isolate them from that group'.[14] A similar scheme has just started in Birmingham as a joint venture between the Young Foundation (of which the author is Chief Executive) and Birmingham East and North Primary Care Trust (PCT), giving people with long-term conditions a 'Nectar'-style card on which they will receive points for healthy behaviours. Again, pregnant mothers are a first target. In these cases, there is a significant benefit to a third party – the unborn children of mothers who would otherwise smoke. However, there is also, potentially, a risk of gaming, with non-smokers taking up smoking in order to access the incentive. And as with all financial incentives there is a risk of turning a non-economic behaviour into an economic one, ultimately with people expecting to be paid for actions which they should be doing voluntarily.

13 For a short but lucid discussion of current evidence on the use of incentives, see Marteau TM, Ashcroft RE and Oliver A (2009), Using financial incentives to achieve healthy behaviour, *BMJ*;338:b1415.

14 www.nsms.org.uk/public/CSView.aspx?casestudy=72#top

Bans and more intrusive interventions

At the more intrusive end of the intervention spectrum is the use of interventions such as **full or partial bans**. Smoking provides an interesting example here: as the evidence of harm has been accepted by the public, government intervention has grown from simple provision of information to, first, the provision of a wide range of support to stop smoking (helped by the development of new medicines and other aids) and then, more recently, the introduction of a ban on smoking in enclosed public spaces. Despite its intrusive nature, public support for this remains quite strong, in part because the public have been convinced of the harm to others as a result of passive smoking, in part because some smokers themselves felt that it would help them to quit, but also simply because many non-smokers find the smoky atmosphere that used to prevail in pubs and some restaurants to be unpleasant. This suggests that building support for interventions at the more intrusive end of the spectrum not only takes time, but may also depend on building coalitions of people with different perspectives.

Another example of an intervention that lies at the intrusive end of the spectrum is Singapore's approach to tackling childhood obesity. This involves compulsory exercise for overweight children, as well as careful monitoring of their diet – both of which involve some explicit segregation from others at school. While this has successfully reduced rates of obesity in children from 14% to 9% (at a time when obesity has been rising in neighbouring countries), it has been argued that this has come at the price of stigmatising overweight children (which may have been a prime influence in getting them to lose weight), and a growth in psychological problems, including eating disorders.[15]

As a rule, there is much more legitimacy for measures that focus on protecting children rather than adults. The parallel report written by Richard Reeves argues that adults should be free to harm themselves if they so wish (subject to providing information and shaping environments so that there is no bias towards harm). So, looking ahead, options such as banning smoking in cars when children are present, increasing tax on alcopops and regulating marketing of food to children will all be seen in a different light to measures aimed at the whole population.

Section 3 Assessment of Past and Current Approaches – What Has Worked and What Hasn't

Key messages

- The reduction in smoking prevalence in the UK over recent decades is an impressive public health achievement. The continued reductions in recent years owe much to the combination of a range of approaches.
- However, smoking may not provide a model for policy in other areas, such as drinking or diet – moderate consumption of fatty food, for example, does not have the same scale of negative health consequences as moderate smoking.
- The lessons from other areas of successful behaviour change are also quite limited. Most of those changes involved relatively marginal changes to behaviour which were not so closely bound up with identity and cultures, whereas challenges such as the UK's relatively high rate of teenage pregnancy are much more complex.

Over time, government has tried a range of approaches across the intervention spectrum outlined above. This section examines the reasons for successes and (relative) failures in different areas.

Arguably, the most impressive example of behaviour change in recent decades in health has been the reduction in smoking. This has been influenced by a combination of nearly all the tools described above, ranging from information, to financial incentives, to environmental shifts. Smoking cessation programmes provide a wide variety of support for people to stop smoking – including nicotine-replacement therapy, counselling services, etc – which has been shown to improve the chances of successfully quitting. It has an impressive track record – over the last year, the NHS helped 337,000 people stop smoking, as measured by quit rates at four weeks. This represents a slight fall from 2007/08, but that was helped by the introduction of the ban on smoking in enclosed

public spaces. At a cost of £219 per person (excluding pharmaceutical costs), the intervention looks very cost-effective when compared with NICE cost-effectiveness thresholds.[16]

Of course, the success in reducing smoking rates – now below the 2010 target of 21% – has taken over 40 years, starting with the dissemination of information on the harms caused by smoking and, perhaps, culminating with the ban on smoking in enclosed public spaces, a measure that was politically unthinkable only a few years previously. The personal harm involved in smoking is unambiguous, and the collateral harm to others is hard to ignore.

Smoking appears to provide a model for other fields, showing how over a period of decades more moderate actions can contribute to a climate of opinion in which more drastic changes become legitimate. However, this is by no means guaranteed. In other areas, successes have been more limited (e.g. the number of 'heavy' drinkers has increased slightly over recent years from 7% to 10%, although overall alcohol consumption appears to have peaked in 2004.[17]) Moreover, efforts to tackle smoking are different from those to reduce excessive alcohol consumption and encourage good diet and exercise, in that smoking is comprehensively bad for health and its impact is cumulative. None of the other key behaviours discussed here have the unambiguous characteristics of smoking – drinking undoubtedly causes significant collateral harm, but most drinking doesn't. Excessive eating creates costs but doesn't directly hurt others. As a result, it's wrong to assume that other policy areas can simply follow the example of smoking.

Looking more broadly, the types of intervention in other fields that look to have been most successful have generally involved relatively marginal changes to behaviour which were not so closely bound up with identity and cultures:

- increased road safety, including the reduction in drink-driving, and the use of seatbelts and motorbike helmets;
- more recently, the increased use of bicycle helmets (although this is not mandatory, unlike seatbelts and motorbike helmets);
- dog owners cleaning up after their pet in public spaces, such as parks and pavements;
- the fall in the number of cot deaths;
- the shift from full-cream milk to skimmed milk and from butter to low-fat spreads over the last 20 years;
- the increase in the use of sunscreen and higher factor sun creams over the last two decades;

16 NHS Information Centre, www.ic.nhs.uk/statistics-and-data-collections/health-and-lifestyles/nhs-stop-smoking-services/statistics-on-nhs-stop-smoking-services:-england-april-2008-to-march-2009. Clearly, there are weaknesses in measuring quit rates after only four weeks – not least because we know that it often takes a number of attempts before smokers successfully quit – but given the low costs of this intervention, it is still extremely cost-effective.

17 Institute of Alcohol Studies (2008), *Drinking in Great Britain*, http://209.85.229.132/search?q=cache:5o_qv8iKub0J:www.ias.org.uk/resources/factsheets/drinkinggb.pdf+UK+pure+alcohol+consumption+per+person&cd=2&hl=en&ct=clnk&gl=uk

- the 'Milife' programme developed by Unilever,[18] an example of a successful weight loss programme developed by the private sector, which looks to have achieved good results in early trials;[19]
- WeightWatchers and Alcoholics Anonymous, good examples of other successful health programmes led by non-government organisations; and
- the Family Nurse Partnership programme, developed over many years in the US and now adopted in the UK, with apparently strong outcomes potentially justifying its relatively high costs.

Most of these involved relatively simple actions, compared with some of the complex changes that might be needed to tackle obesity, drug and alcohol abuse, or teenage pregnancy, for example. They also provide some interesting contrasts:

- They do not all require government action: where there are potential markets, as in weight-loss programmes, drugs treatment or nicotine patches, the private sector may have an important role. Similarly, private responses to public concerns about saturated fat – partly driven by government campaigns – have helped drive the shift to lower-fat spreads and skimmed milk.
- Some changes have been led by coercive actions, particularly in road safety, but this has not been universal: the increase in the use of bicycle helmets has not required legislation backed by penalties.

There are also plenty of examples of relative failure. The UK does relatively badly in areas such as sexually transmitted infections, binge drinking, drug use and teenage pregnancy (which has seen some reductions in recent years with teenage births at their lowest level for 15 years, but still remains high relative to most other European countries). Experiments can sometimes make things worse. Some evaluations of drugs education suggested that it may increase usage rather than reducing it. One recent pilot, conducted separately from the teenage pregnancy strategy, may even have led to an increase in teenage pregnancy rates[20] (though, of course, part of the purpose of pilots is to test out alternatives). In all these cases the causes of failure were complex, but in every case part of the reason was that the counter pressures – from peers, from pleasure – were too strong.

Section 4 So What More Could be Done?

Key messages

- Individual members of the public may feel 'bombarded' by a range of separate, uncoordinated public health messages from government (on top of stories in the media), with little sense of which to prioritise or where to start, which risks encouraging people to be sceptical about and 'switch-off' from all public health messages.
- There is an opportunity for the Department of Health and the local NHS to examine a more person-focused approach, supplemented by targeting based on lifestage and other transition points.
- Some of the Department of Health's current work is already moving in this direction – for example, *Change4Life*. This is a very positive step.
- Some members of the public may be turned off by what they perceive (fairly or unfairly) as a relentlessly negative stream of campaign messages – not just from government but also from charities, various experts and from the wider media.
- As is already being done by campaigns like *Change4Life*, there may be a case for shifting the balance of messages towards life and wellbeing rather than only health, and about feeling good now as much as avoidance of future conditions.
- Our behaviours are influenced by a whole host of organisations, from national departments to local authorities, media and business. So, to change behaviours, the Department of Health and local NHS organisations need to build coalitions and work collaboratively with those other organisations.

I've already suggested some of the types of policy that need to be pushed forward, including more systematic use of tools to shape choice architectures, incentives, one-to-one influence and so on. In every case, however, the details are all-important: dosage, calibration and timing are decisive. Too much use of financial incentives, for example, undermines their effectiveness (as people then start to expect to be paid for actions). Too much reliance on health coaches can easily become very expensive as caseloads shrink. Too assertive a redesign of choice architectures can quickly lead to resentful backlashes.

I would also argue for a change in how information campaigns (and the policies that underpin them) are considered. Interventions to improve health and wellbeing can tend to focus on the activity rather than the individual, e.g. separate interventions are planned for alcohol, tobacco, illegal drugs, exercise, etc. This allows staff to develop expertise in relation to a particular health issue, and can make sense in terms of designing universal policies such as bans or taxes. However, the downside to this approach is that **individual members of the public may feel 'bombarded' by a range of separate, uncoordinated public health messages from government (on top of stories in the media), with little sense of how best they can make a difference to their own lives. There is also a risk that too much information can encourage people to be sceptical about and 'switch-off' from all public health messages**.

Some of the current work on health inequalities (and *Change4Life*) is attempting to follow segmentation of the public, with more tailored messages linked to how people are and live rather than conditions. Messages and actions are also being targeted at **particular points in time**, when people are likely to be more receptive to interventions. This could be **lifestage** (e.g. the Financial Services Authority provide a booklet on the financial consequences of having children, which is used by midwives to help them answer the frequent questions on finances they found that they were receiving from families with young children); **situation** (e.g. radio adverts for a particular flu treatment were recently targeted at commuters travelling to or from work – when the adverts were most likely to be salient to those not wanting to miss work – and resulted in a 25% increase in sales); and **life transition** (e.g. hospital treatment or discharge; claiming unemployment benefit for the first time; starting a new school; GP check-up).

The **channel** for health messages is also extremely important. The temptation in some parts of government is often to opt for mass advertising, as that will hit the highest audience numbers. But the efficiency of this is open to question – it risks substituting the appearance of action for effectiveness. One of the paradoxes of a more media-intensive environment is that 'circles of trust' – family and close, trusted friends – have become more important in the key decisions we make. One key question for public health professionals, therefore, is how they might mobilise the parts of the NHS or other services which are closest to this in order to get important messages 'out there'. For example, those services which have face-to-face contacts, and build long-term relationships with members of the public, might be best-placed to deliver what can sometimes be difficult messages about the need for someone to lose weight or stop smoking, etc. These messages can be helped if there is a backdrop of public information and awareness raising – again reinforcing the point that it is the interaction of different tools that is decisive.

Given the evidence that behaviours are influenced by networks and relationships, there is clearly scope for much more efficient interventions that target particularly influential individuals, or individuals who link many different networks. If they can be persuaded to stop smoking, or to change their diet, they may influence many others. The tools for identifying these individuals, and working with them, remain much less developed than mass communications tools, but may turn out to be much more cost-effective in the long run.

Clearly, the role of **professionals** here is crucial, and in particular, choosing them on the basis of, and/or providing them with training in, the most effective **interpersonal skills**. This is noticeable in the Family Nurse Partnership (FNP) programme, for example – its success is heavily predicated on such skills, not least because it is often dealing with people who have previously been (or feel) let down by 'the system'. Non- and paraprofessional roles could become increasingly key in such one-to-one, relationship-based services, where the key requirements are often more about people skills – the ability to empathise and share a problem – rather than medical interventions (although this will vary between services).

Apart from the specific issues highlighted above, there are a number of broader areas where further shifts of approach may help deliver more effective behaviour change interventions. These include the form and tone of public health messages (which are at least as much about the underlying policy approach as the messages themselves), and how allies might be more effectively mobilised. The following sections address each of these in turn.

The form and tone of public health messages

Allied to the issues highlighted above about the delivery of public health messages is the issue of the **tone** of those messages. This was a particular issue highlighted in our research, which suggested that some members of the public may be turned off by what they perceive (fairly or unfairly) as a relentlessly negative stream of campaign messages – not just from government but also from charities, various experts and from the wider media. Sometimes scary messages are necessary to break through, as with the 1980s *Don't Die of Ignorance* campaign. But they have to be used sparingly.
The *Change4Life* and related campaigns are attempting more positive messages about the benefits of a healthier lifestyle. If, as early results suggest, this has had a very large take-up, e.g. of returns of cards requesting personalised advice on diet for families, it is worth asking whether adopting similarly positive approaches in some other areas might also lead to greater engagement with public health messages.

Wherever possible, messages should be about life and wellbeing rather than only 'health', which can be interpreted solely as the absence of illness rather than in a more holistic sense; about feeling good now as much as avoidance of future conditions; and with a recognition that people are balancing health concerns with others, including scarce time and wanting to have fun. Examples of such approaches might include messages along the lines of, 'If you only do one thing, here's five simple suggestions…', and 'try to be balanced, not perfect'.

Some countries have used humour and lightness in their public health campaigns – for example, in Australia campaigns against excessive driving speeds focused on the idea that speeders had small penises, playing directly on macho stereotypes but in a light way that was 'sticky' – i.e. easy to remember. Knowsley Primary Care Trust (PCT) has created a 'Haynes Manual', based on the car maintenance manuals, for 'Knowsley Man', aimed at engaging hard-to-reach male audiences.[21] An alternative but equally innovative example is Florida's *Truth* anti-tobacco campaign aimed at teenagers. Previous campaigns were thought to have been unsuccessful because they took the form of adults telling teenagers what to do, infringing their strong sense of autonomy. The *Truth* campaign, by contrast, emphasised how adult-run tobacco companies were manipulating teenagers into smoking.[22]

Mobilising allies

Our behaviours are influenced by a whole host of organisations, from national departments to local authorities, media and business. So, to change behaviours, the Department of Health and local NHS organisations need to build coalitions and work collaboratively with those other organisations.

Campaigns such as *Five a Day* and *Change4Life* have helped to turn some **businesses** from potential competitors into allies with, for example, many firms using the fact that their products 'count' towards the five-a-day target as a marketing tool. Similarly, working with train companies to improve access and facilities for cyclists could play a major role in increasing the take-up of cycling and the health benefits that this could bring.

Even where health and business interests are not aligned, there are some opportunities for quick wins, which should not involve over-onerous regulation, but can be achieved by shaping default decisions or providing information at the point someone makes a decision. For example, changing (or, rather, reverting) to a standard wine glass of 125ml or a standard single measure for spirits in pubs and restaurants – while still offering the option of a larger glass for those who want it – would be relatively straightforward, and copying New York's example of ensuring that calories are printed on restaurant menus would help to inform consumers and allow them to make decisions using that information, without impinging on their liberty. Ensuring that calorie content is provided on alcohol containers is a similar example – given that Customer Insight work suggests that aesthetic issues are more important to many people than health ones, this might be effective at reducing excessive drinking.[23]

21 209.209.85.229.132/search?q=cache:FU0FWR2ENJ0J:www.menshealthforum.org.uk/uploaded_files/MHFmag9.pdf+%22knowsley+man%22+%2B+%22haynes+manual%22&cd=2&hl=en&ct=clnk&gl=uk

22 www.tobaccofreedom.org/msa/articles/truth_review.html

23 This could risk leading to people choosing to drink rather than eat – clearly, any such approach would need to be carefully designed, targeted and piloted before it was fully rolled out.

There are also opportunities for less easy wins from working with business. The Government has already taken steps in this area such as banning all advertising of tobacco, and restricting advertising during children's programmes on television. **Further steps along this route might involve tackling what some have described as an environment of 'toxic advertising' in our towns and cities, where adverts to promote unhealthy food and drink outnumber more 'healthy' messages**. Clearly, there is a balance to be struck between restrictions to protect health and the right of companies to market their products, but given what we know about the impact of people's wider environment on the choices they make, it is questionable whether that balance is currently right.

Local government is perhaps the most important partner for the Department of Health and the NHS in delivering public health objectives. Importantly, many people working in local government are keen to play a bigger role in promoting public health, as is shown in the number of health targets chosen by local authorities themselves among their own objectives. Good examples include the partnership between Knowsley PCT and Knowsley Council,[24] as well as in health-related fields such as transport (e.g. **Smarter Travel Sutton**),[25] which provide concrete examples of the contribution to public health goals which local government can make. Of course, local authorities play a key role in education, and health partnerships at local level with both them and the schools for which they are responsible can deliver significant long-term health benefits.

Going forward, the Department of Health is working on **Health Impact Contracts**, where it might commission services directly from local authorities where they are best-placed to deliver health benefits, with funding linked to outcomes as well as activities. This would be an important development, helping to generate better ideas at local level, not least by providing competition to traditional sources of provision, and tapping into expertise that already exists. Another idea that might tap into local creativity and social entrepreneurship would be to build on the *Healthy Towns* initiative to get local authorities, local NHS organisations and other partners to work together to compete for funding and other support for comprehensive health plans.

Last, but far from least, **charities** can be key to delivering improved services locally and improving health. Their contribution comes in a range of forms, including para-professional roles and support groups. In past decades, the organisation I now run helped give birth to many organisations mobilising citizens – from the Open University to the University of the Third Age (U3A), where older people get involved in teaching and passing on their skills to their peers, the College of Health and the Patients Association. The time might be ripe for similar models to the U3A but focused on health – for example, supporting peer-led projects, or projects engaging the younger elderly, in preventing falls or reducing frequent readmissions to hospital.

24 See, for example, a brief summary at www.idea.gov.uk/idk/core/page.do?pageId=6462772

Section 5 What do the Public Want?

Key messages

- Public views and perceptions are an important constraint on the range of tools which are open to government to influence behaviour change – and a large proportion of the public, across different social groups, is resistant to more intrusive interventions.
- While this is only one study, albeit with a robust methodology, it does suggest public concern about the perceived tone of health messages and the 'blanket' approach of some health interventions.
- Health professionals indicated a degree of scepticism about much of the public's willingness to change behaviours which carry health-related consequences. Those working in secondary care didn't feel particularly empowered to talk to patients about underlying causes of ill health, while primary care professionals emphasised the need to take a positive approach in order to successfully influence behaviour.

One of the factors that sometimes gets lost in debates on public health issues, many of which are dominated by particular lobbyists, charities, professionals and others with particular views and interests, is the wishes and views of the wider public. Having examined the evidence on how to change behaviours from fields such as behavioural economics and psychology in the earlier sections of this report, we now test these insights against the insights we obtained from members of the public and health professionals as part of this project.

Any actions to change public behaviour need to be seen as legitimate by the public. Most people are strong believers in personal choice and their own right to make unhealthy decisions. While the majority of people accept that the evidence on harm from smoking is strong enough to justify government intervention, this is not the case for alcohol, which tends to be regarded as a social disorder issue, rather than a health issue, other than for children.

> *"This is the freedom of choice thing… if kids are drinking beer from supermarkets then stop selling that to them… don't spoil it for the rest of us and ban it."*

The main barriers to healthier behaviours appear to be the busy nature of most people's lives (particularly for those with children), safety factors and the many temptations that surround us. However, it may well be that some barriers are merely excuses. Many people can and do change health-related behaviours, but the motivation to do so often relies on a particular experience (which makes the risk salient to them, e.g. illness – their own or that of a friend/family member). Exercise is generally seen positively, but is often used as a compensatory mechanism for 'bad' behaviours (e.g. eating a cake or getting drunk the night before).

> *"I did smoke for years… I was always feeling bad and short of breath and knew that it was bad for me. But then I ended up in hospital and everything changed."*

In terms of specific 'wants', four major themes arose:

- People tended to prefer positive, encouraging messages from government to those which cajoled them. This could be supported by practical support, such as free access to exercise facilities, but there was strong resistance to the use of financial incentives, which it was felt would reward 'bad' behaviours.
- Communications such as advertising campaigns should be based on 'real people', and should not use statistics or shock tactics. It was also important that there was real proof of harm – some messages (such as that on alcohol) were not believed.
- Campaigns should not 'nag' people, and interventions should be targeted, rather than being broad-brush (the latter was felt to unfairly 'punish' the innocent).
- There should be a particular focus on parents and children – it was felt that it was best to 'catch people while they are young' in order to develop healthy habits for life.

Naturally, there are tensions between these views and some other evidence about what works best,[26] and a wide range of views underlie these summaries. People tend to say that they want positive messages – even though frightening ones are often more effective in shifting behaviour. But even with this caveat there are important lessons about being sparing with negative messages.

26 Of course, one possible interpretation is that, even where an intervention is successful – a very successful campaign may be one which changes behaviours in less than 10% of the population – it may be so at the expense of 'turning off' a large proportion of the rest of the population.

The view from the front line

Our research also included focus groups with health professionals. Many believe that the public are not sufficiently motivated to change behaviour and things may be getting worse. They fear that people still expect the NHS to sort them out without taking personal responsibility – and again, that this is becoming more, not less pronounced.

> *"You see people in the clinic with diabetes and they treat it like your problem, that the diabetes is the NHS's to deal with, not theirs."*

Secondary care professionals, while recognising that underlying behaviours might contribute to patients' conditions, did not feel empowered to talk to their patients about this, instead focusing on treatments and cures, while professionals working in primary care tended to prefer a partnership-based approach to changing behaviour rather than a more directive one, arguing, for example, that, 'People don't like direct honesty, you have to be positive to even get them on board'.

> *"She said, 'Oh, I'll just get a gastric band… the NHS will pay for that'. No one wants to put any work into being healthy any more."*

Section 6 Conclusions and Recommendations

The prize from changes in health-related behaviours is potentially enormous, particularly in terms of increased healthy life expectancy: for example, while women aged 65 have an average life expectancy of 19.5 years, their average healthy life expectancy is only 11.1 years. There is a similar gap for men, whose life expectancy at 65 of 17.0 years translates into healthy life expectancy of only 10.3 years.[27]

However, behaviour change is not straightforward – for individuals themselves, let alone for governments. So making progress in this area will take time – just as it has with smoking – and will require consistent, long-term actions to shift cultures, to change the environment in ways that make healthy decisions easier, and to provide more targeted, individualised support to individuals and communities. The key lesson from both theory and practice is that behaviour change needs to be approached in mutually reinforcing ways that impact on decisions made both by our 'rational' minds and subconsciously, and reinforced by our environment. In the 19th century, behaviour-change issues dominated civil society – in everything from temperance to Sunday schools. Today, too, top-down measures need to be aligned with the bottom-up pressures of change that are closer to a social movement than a government programme, as public culture becomes more aware of health. The key themes to emerge are:

- the need, in our messages on public health, to put more emphasis on the positive, in particular how people can feel better by changing their behaviours;
- to speed up experiment, with faster learning, in order to develop as rapidly as possible the robust evidence base needed to underpin more effective behavioural interventions;
- linked to this, the necessity for the Department of Health to orchestrate its own knowledge to ensure that it remains on top of the rapidly evolving evidence base on behaviour change, segmentation and the design of environments;

27 European Commission (Nov 2008), *Healthy Life Years in the European Union: Facts and Figures 2005*. ec.europa.eu/health/horiz_publications_en.print.htm

- that the most powerful tools involve reshaping environments to encourage people to make healthier choices, while still leaving open the option of choosing differently. But there is broader scope to widen the mix of policy tools used to influence behaviour, ranging from personal trainers to financial incentives;
- that only a small part of behaviour change is under the control of the Department of Health or the NHS, so it is vital to mobilise partners in the media, business, local authorities and across central government; and
- that leadership – including by ministers – is crucial. Messages which show key leaders walking the talk, together with honesty about the difficulties of changing behaviour, are a vital complement to other types of message.

Given these key themes and principles, my immediate recommendations cover six broad areas:

i. First, public campaigns will continue to play an important role, even if their impact has, in the past, sometimes been exaggerated. But to succeed against a backdrop of the huge volume of messages being sent to people, the emphasis of policy and the tone may need to be less paternalistic (and occasionally patronising) and more supportive; to emphasise less the negative and more the positive, in particular how people can feel better by changing their behaviour. Sometimes it will remain necessary to challenge and even shock people – and, at least in the case of smoking, negative messages can be more useful in relation to why to quit, with positive messages being more important in relation to how to quit. But messages of this kind need to be used sparingly. The language of prevention, for example, can go against the grain.

   The *Change4Life* programme is a good step towards this kind of approach, though it will be important to use its assessment as an opportunity to reflect on the balance between mass media messages and more targeted interventions. It points towards an approach to health improvement which fits with people's own approach to behaviour change – i.e. one which will tend to be more about **balance** or 'doing one thing' to start with, rather than completely overhauling their lifestyle (which is the message that many people get from the multitude of communications about health from government and the media).

   Other messages that might support this change of emphasis would:

   - **tackle the perception that exercise is about going to the gym** (which, judging by our research, appears to be widespread);
   - emphasise the **wellbeing** aspects of exercising rather than just the health benefits (e.g. 'Do one thing and feel good'); and
   - **help people to fit exercise into their daily (and often busy) lives** (e.g. exercise that people can do while they go to work, listen to the radio, etc).

   The *Let's Get Moving* pilots currently being evaluated by the Department of Health may provide one way to approach this. There is also scope to get people to think about health in a more holistic way – people still tend to equate 'health' with 'hospitals', rather than the impact of their daily decisions.

One option which brings some of these points together would be to pilot **positive psychology and resilience** tools with at-risk groups. Several thousand primary school pupils are already benefiting from learning these skills. At the other end of the age spectrum there is considerable evidence that learned optimism has a strong impact on recovery from strokes and heart attacks, and life expectancy. Health trainers could be taught some of the techniques being used in schools to help children to be more resilient, with subsequent testing of both psychological and physical health effects (the US Army is embarking on a very widespread programme of this kind). A virtue of these methods is that they help to enhance self-efficacy, which is one of the preconditions for choosing and following healthier lifestyles.

ii. Second, while the current evidence base makes it difficult to make many immediate recommendations on specific programmes, one area where this is possible is to extend financial incentives for pregnant mothers to quit smoking, drawing on current successful pilots in Dundee and Birmingham. The main target should be communities where smoking remains very prevalent – and where modest incentives could have a significant impact.

iii. Linked to this last point, although I recognise the range of competing priorities, more health research would ideally be focused on behaviour change and, given the current level of pilots in this area, might not require very much additional funding. Despite some very strong evidence – collated by NICE among others[28] – on the effectiveness and cost-effectiveness of *some* behaviour change methods, the great majority have not been adequately studied or measured on a systematic basis. Public and private investment in health research is overwhelmingly skewed towards clinical solutions rather than the ones described in this report (only around 2% of the health research budget goes on prevention).

iv. The fine grain detail of how environments are shaped is becoming increasingly important to health. An important challenge for the future will be to ensure that more people involved in policy and service design have a feel not only for the evidence on behaviour change but also for the details of successful service and physical design. In the long term, the most important actions will **reshape environments**. This is where local government can play the greatest role, for example by reducing the prevalence of fast-food outlets on high streets, making it easier for people to walk or bicycle by making changes to street design, establishing new norms (such as preventing traffic close to primary schools at the beginning of the school day), and looking at the fine detail of how products are made available.

28 guidance.nice.org.uk/PHG/Published

v. Fifth, partnerships and closer working are also crucial. This might be about partnerships between government departments – from the wide range of child health issues which are jointly covered by the Departments of Health and Children, Schools and Families, to the former's partnership with HMRC to tackle tobacco smuggling. But it's also about collaboration with the media, business and local authorities. Some good examples are the work that the Food Standards Agency (FSA) and Department of Health are doing with the food industry through the Healthy Food Code of Good Practice to pilot calorie labelling on menus and menu boards to help consumers of point of choice, to continue to push for agreement with manufacturers on smaller portion sizes (e.g. of chocolate bars and soft drinks), and to rebalance the advertising and marketing of food to children to reduce their exposure to promotion of food high in fat, salt and sugar and increase their exposure to promotion of healthier options.

vi. Finally, the Olympics provide an ideal catalyst for a more ambitious approach to area-based projects – for example, challenging major towns and cities to compete to transform their fitness and overall health and wellbeing. Nowhere in the UK has yet attempted a comprehensive strategy to boost exercise levels – yet the time must be ripe to do this. Building on ideas such as ***Healthy Towns***,[29] **with an emphasis on across-the-board approaches supported by a range of local partners, and with incentives such as increased funding attached to the winners**, might galvanise local efforts to come up with innovative approaches to these health issues, as well as capturing the imagination of the public (as has happened with cities of culture, for example). Such initiatives could be funded both at institutional level (PCT and local authority partnerships) and at community level (e.g. helping to build social capital by supporting people from a housing estate to tackle a health-related issue).

   There is also a key role for political leadership to encourage people to be aware of the unhealthy choice environment which advertising brings – in particular, that advertising tends to encourage overeating or drinking rather than the reverse. This may not be the place for regulation and law – but major businesses could be much more vigorously held to account for the messages they send.

   Indeed, there is a good case for ministers to be more explicit about the competition there is to get messages through, highlighting the **'toxic messaging' that many would argue is pervasive in advertising messages in our cities, and represents a negative form of nudging by companies**. A walk or drive around any city in England will show that the balance of messages will be anti-health – this sends a strong subliminal message to people. Clearly, there is a balance to be struck here between legitimate commercial activity and the public interest, but at the moment there is a clear conflict between the producer interest in promoting addictive, damaging behaviours and the consumer interest. A live issue relating to this is whether product placement should be permitted for alcohol, tobacco or unhealthy foods.

29 www.nhs.uk/change4life/Pages/NewsHealthytowns.aspx

Organisation within the Department of Health

Some cultural and organisational changes might usefully support the recommendations and steps laid out above. For example:

- The Department of Health and the NHS, both locally and nationally, might want to put greater emphasis on tackling health issues via 'non-health' routes, such as creating safer environments in which people can exercise (perhaps through Health Impact Contracts).
- It would be worth rethinking the balance between different types of intervention (advertising campaigns, the provision of information, 'blanket' vs. targeted interventions, etc), both in terms of particular issues and overall.
- There is a case for organising health improvement policy around life-stages, target groups and/or the environments in which people live, rather than particular issues (e.g. alcohol or smoking), in order to help provide a more holistic, person-centred approach and reduce the risk of bombardment by competing health messages.[30]
- Underpinning all of these, there needs to be a clear locus of expertise in the increasingly important territory of behaviour change, which can be drawn upon for detailed policy and programme design.

Recommendation	Where fits on intervention spectrum	Timing
Change emphasis of public health messages from condition to the person, and to emphasise small steps rather than the need to change whole lifestyle.	All	Short term
Broaden the approach exemplified in work by the Department of Health and the FSA with business to other areas of primary prevention, in order to develop more policy options which are aimed at changing choice architecture.	Changing choice architecture	Medium term
Introduce Dundee-style financial incentives for expectant mothers who smoke, targeted initially at deprived areas.	Incentives	Medium term
Create more across-the-board *Healthy Towns Plus* initiatives with funds awarded to best bids from: a) institutions (joint bids from primary care trusts (PCTs), local authorities, etc); and b) local communities.	Incentives, Reshaping environment	Short term (link to Olympics?)

30 DH Healthy Foundations Life-Stage Segmentation Model: www.dh.gov.uk/en/PublicationsandStatistics/Publications/PublicationsPolicyandGuidance/DH_090348

Recommendation	Where fits on intervention spectrum	Timing
Department of Health to take a greater health leadership role in Whitehall, and look for opportunities for more effective delivery of its public health objectives through partnerships with other departments (e.g. as it has done on tobacco smuggling with HMRC).	All	Medium term
Tackle 'toxic messaging' in our towns and cities by working with advertising industry, on a voluntary basis if possible, to limit volume of advertising with negative health consequences.	Reshaping environment	Medium to long term

Annex A:
The Department of Health Healthy Foundations Life-Stage Segmentation Model

Background

The Healthy Foundations Life-Stage Segmentation Model provides the Department of Health (DH) with a detailed and consistent understanding of the nation by segmenting people into different groups based on their ability and likelihood to live healthily. This in turn provides a tool for the systematic adoption of consumer behavioural insight into policy development; programme planning and delivery at a national, regional and local level. The key message is that Healthy Foundations isn't only a tool for campaign planning, it's a way of ensuring evidence based policy making is more robust through the systematic use of consumer insight, alongside other sources of knowledge/data informing policy.

The project began in 2006 with the aim of building on existing research and knowledge within DH and academia to arrive at a segmentation of the population of England, looking at the drivers of behaviour across the six Public Service Agreement (PSA) areas: smoking, obesity, alcohol, substance misuse, sexual health and mental health. The research used epidemiology, social and consumer research and the health PSA targets to produce a model to target audiences.

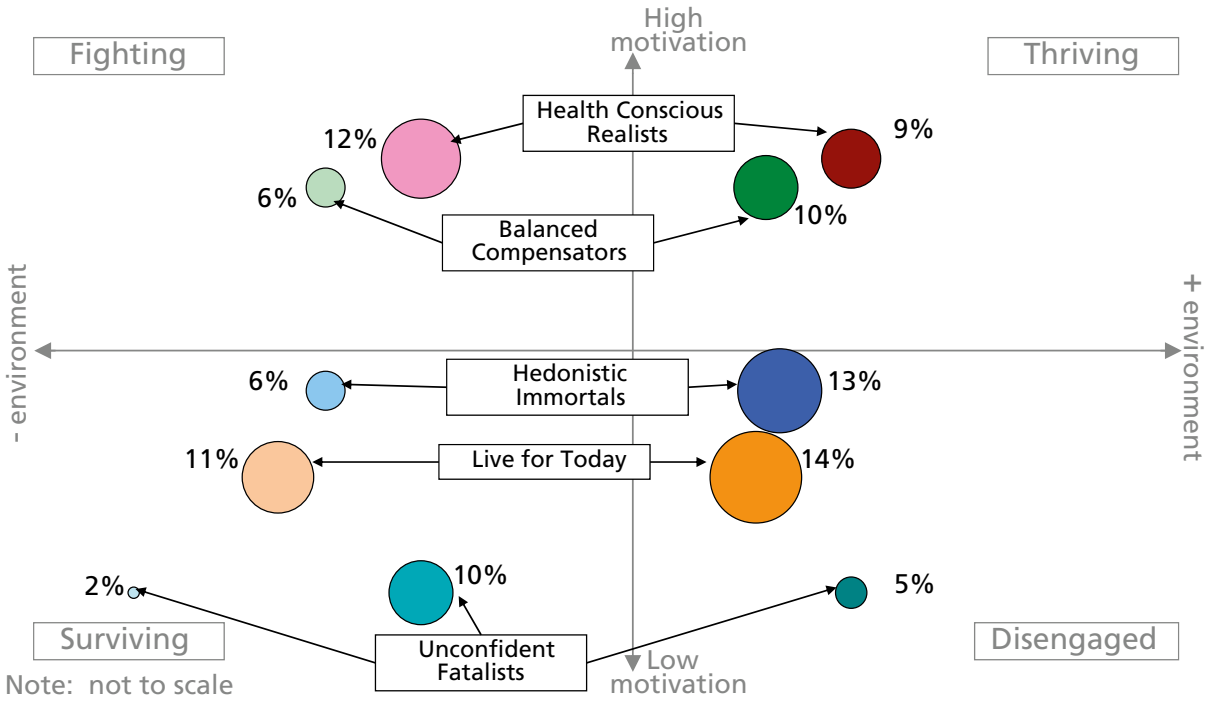
The model is intended as a building block for a customer-focused approach to the development of health behaviour change interventions. The use of segmentation is not new to DH but there has not been one consistent approach to segmentation across the different PSA target areas. One of the objectives of this project was to develop a segmentation framework or model that can be applied across issues, thereby giving a '360 degree' picture of the population rather than a series of overlapping views of people taken from the perspective of each issue.

The research team reviewed more than 80 reports, mapping behavioural drivers and barriers to identify any commonalities across existing target audiences and health issues. The following factors were considered:

- behaviour/lifestyle
- attitudes towards health, decision-making priorities, aspirations (and other shared attitudes which may affect health behaviour), and
- knowledge, attitudes and beliefs forming the basis of current behaviours.

They then interviewed DH stakeholders with an expert understanding of the target audiences currently addressed in campaigns to find out whether the drivers identified matched the stakeholders' own understanding, prioritised them and identified further research. They also held review workshops with key members of DH, health professionals, academics and segmentation experts.

In this way the team identified three overarching 'dimensions' that had the greatest significance when identifying population segments most likely to adopt 'at-risk' health behaviours, and which work collectively to determine people's ability to live healthily and likelihood of doing so. These were:



- age/life-stage
- circumstances/environments, and
- attitudes/beliefs towards health and health issues.

Pulling the three dimensions together, we are able to create a rich picture and model for a consistent approach across DH. It should be acknowledged that working with three dimensions rather than two is relatively unusual in health segmentation models. However, it is more frequently used in commercial approaches. It is clear from the research that the task of looking across the entire population on a range of motivations, environments and life stages requires this extra level of sophistication.

In summary, the segmentation model pulls together all three dimensions – age/life-stage, circumstances/environments, and attitudes/beliefs. The life-stage is the foundation, with each life-stage then segmented further by circumstances and attitudes into four categories that the team named 'fighters', 'thrivers', 'disengaged' and 'survivors'.

This segmentation results in the following cluster map:[31]

DH Healthy Foundations Life-Stage Segmentation: cluster map

31 www.dh.gov.uk/en/Publicationsandstatistics/Publications/PublicationsPolicyAndGuidance/DH_090348

Healthy Foundations Life-Stage Segmentation Model: initial findings

The Healthy Foundations team found significant differences in health behaviours within different life-stages. A new segment (Alone Again) has been created through Healthy Foundations and this life-stage has been recognised by other government departments as a key target audience due to their behaviours.[32]

The research also found significant differences in health behaviours within each of the five motivation segments, when these were combined with variations in environment (based on the Index of Multiple Deprivation, IMD) within each segment. Those in the most deprived areas tended to exhibit the least positive health behaviours, but this impact was not consistent:

- Environment had an impact on diet and smoking regardless of motivation;
- But for other health behaviours, environment had less of an impact on motivated segments, and a greater impact for less motivated segments.

Taken together, the evidence from Healthy Foundations raises a number of interesting issues and questions:

- It highlights the importance of environment, and its affect on people's ability to change.
- It highlights that a 'single health issues' approach to health improvement and protection may not be the most effective way of engaging with the population.
- But it also highlights the importance of intrinsic motivation as a potential way of mitigating the impact of environment. Some people living in poorer areas report positive health motivations and behaviours. Identifying and exploring how this 'resilience' was formed and sustained will be useful to policy makers in identifying effective interventions (which would probably apply across a range of areas, and not just health).
- It also suggests that the link between living in a poorer community and poor health may not be as straightforward as the headline figures for health inequalities – which show a big gap in life expectancy between different socioeconomic groups – suggest. In particular, it shows that different attitudes to health and healthy lifestyles cross social boundaries – although a greater proportion of those living in the poorest communities might be in the 'Unconfident fatalists' and 'Live for today' segments, others in deprived communities *do* manage to live healthier lives. Understanding the differences within communities might help us to tackle health inequalities more effectively.

Annex B:
Psychological Models of Behaviour/Behaviour Change

Recently, behavioural psychologists have attempted to develop more holistic models of behaviour change which offer the potential to create a single model. We have looked at three such comprehensive models:

- Robert West's **PRIME theory**;[33]
- Strack and Deutsch's **Reflective-Impulsive model**;[34] and
- Vlaev and Dolan's **RAM model** and **SNAP framework**.[35]

The key insights from these models are:

- **The three different ways of influencing individuals' behaviours cannot easily be disentangled: many interventions will work via more than one route, or you may need a combination of interventions in order to achieve change**. For example, our Customer Insight work suggested that most people knew that they needed to exercise more (their 'rational brain' has been persuaded), but that this was often outweighed by the environment in which they lived (e.g. not enough cycle lanes), while their automatic/impulsive system would always choose alternative priorities in their busy lives.
- PRIME theory focuses on people's **wants and needs**, as opposed to intentions and beliefs, and seeks to support behaviour change by establishing personal 'rules' (a type of plan) as a source of new, stronger wants and needs that can help people change behaviour (e.g. outweighing learned cues to smoke,[36] such as having a cup of coffee). The 'rule' must also relate to an individual's 'deep identity' – the 'aspects of self-image to which the individual has strong attachment'.[37]
- Vlaev and Dolan's SNAP framework highlights some of the main ways in which interventions can trigger the automatic/impulsive system to help support behaviour change:
  - **salience** – we react/pay most attention to information that stands out relative to other stimuli (e.g. because it is new or more important);
  - **norms** – social norms regulate our actions, and our perceptions of peer norms provide a standard against which we measure our own behaviours;
  - **affect** – feelings play a strong role in our behaviour, and emotions are a key influence in decision making; and

37 West R (2009a), op. cit., slide 23.

– **priming** – we respond subconsciously to cues in our wider environment, whether direct (e.g. when asked what they intend to do, people tend to act according to their response) or indirect (e.g. many experiments suggest that our actions can be influenced simply by placing particular items in our environment – for example, briefcases and boardroom tables tend to make people less cooperative).[38]

Science and Technology Committee

The Science and Technology Committee is appointed by the House of Lords in each session "to consider science and technology".

Current Membership

The Members of the Science and Technology Committee are:

Lord Broers
Lord Crickhowell
Lord Cunningham of Felling
Baroness Hilton of Eggardon
Lord Krebs (Chairman)
Baroness Neuberger
Lord Patel
Baroness Perry of Southwark
Lord Rees of Ludlow
Earl of Selborne
Lord Wade of Chorlton
Lord Warner
Lord Willis of Knaresborough
Lord Winston

The Members of the Sub-Committee which carried out this inquiry (Science and Technology Sub-Committee I) are:

Lord Alderdice
Lord Crickhowell
Baroness Hilton of Eggardon
Lord Krebs
Lord May of Oxford
Baroness Neuberger (Chairman)
Baroness O'Neill of Bengarve
Lord Patel
Baroness Perry of Southwark
Earl of Selborne
Lord Sutherland of Houndwood
Lord Warner

Declaration of Interests

See Appendix 1
A full list of Members' interests can be found in the Register of Lords' Interests:
http://www.parliament.uk/mps-lords-and-offices/standards-and-interests/register-of-lords-interests

Publications

All publications of the Committee are available on the internet at: www.parliament.uk/hlscience

Parliament Live

Live coverage of debates and public sessions of the Committee's meetings are available at:
www.parliamentlive.tv

General Information

General information about the House of Lords and its Committees, including guidance to witnesses, details of current inquiries and forthcoming meetings is on the internet at:
http://www.parliament.uk/business/lords

Committee Staff

The current staff of the Sub-Committee I are Daisy Ricketts (Clerk), Rachel Newton (Policy Analyst) and Cerise Burnett-Stuart (Committee Assistant).

Contact Details

All correspondence should be addressed to the Clerk of the Science and Technology Committee, Committee Office, House of Lords, London SW1A 0PW.
The telephone number for general enquiries is 020 7219 4963
The Committee's email address is hlscience@parliament.uk

SUMMARY

The aim of much government policy is to bring about changes in people's behaviour and so a government's success will often depend on their ability to implement effective behaviour change interventions whilst, at the same time, avoiding significant harmful side effects.

Governments can use a variety of different types of policy interventions to change the behaviour of the population. These range from providing information or undertaking campaigns of persuasion that promote certain behaviour, to taxation and legislation. In Table 1 of this report we set out a schematic list of types of intervention.

The currently influential book *Nudge* by Richard Thaler and Cass Sunstein advocates a range of non-regulatory interventions that seek to influence behaviour by altering the context or environment in which people choose, and seek to influence behaviour in ways which people often do not notice. This approach differs from more traditional government attempts to change behaviour, which have either used regulatory interventions or relied on overt persuasion. The current Government have taken a considerable interest in the use of "nudge interventions". Consequently, one aim of this inquiry was to assess the evidence-base for the effectiveness of "nudges". However, we also examined evidence for the effectiveness of other types of policy intervention, regulatory and non-regulatory, and asked whether the Government make good use of the full range of available evidence when seeking to change behaviour.

We heard evidence that, although much was understood about human behaviour from basic research, there was relatively little evidence about how this understanding could be applied in practice to change the behaviour of populations ("applied research at a population level"). We make some recommendations to address this issue.

Although we acknowledge that further applied research at a population level is needed, we also found that the available evidence supports a number of conclusions. Our central finding is that non-regulatory measures used in isolation, including "nudges", are less likely to be effective. Effective policies often use a range of interventions.

We concluded that it is important to consider the whole range of possible interventions when policy interventions are designed. We place particular emphasis on this conclusion because the evidence we received indicated that the Government's preference for non-regulatory interventions has encouraged officials to exclude consideration of regulatory measures when thinking about behaviour change. Though there is a lack of applied research on changing behaviour at a population level, there is other available evidence that the Government need to use to better effect. We were therefore disappointed to find that, although we received some examples of evidence-based policies, such as policies on energy-efficient products and smoking cessation services, we were also given many examples of policies that had not taken account of available evidence, including policies on food labelling and alcohol pricing.

We also found that a lot more could, and should, be done to improve the evaluation of interventions. This is not only good practice but would help to build a body of research that could inform effective policies targeting population-level behaviour change.

Understanding behaviour and behaviour change are necessary for developing effective and efficient policies in all areas. Although this report draws on case studies that focus on the Department of Health and the Department for Transport, our conclusions and recommendations are directed to all Government departments.

Behaviour Change

CHAPTER 1: INTRODUCTION

1.1. Many of the goals to which governments aspire—such as bringing down levels of crime, reducing unemployment, increasing savings and meeting targets for carbon emissions—can be achieved only if people change their behaviour. Consequently, understanding how to change the behaviour of populations should be a concern for any government if it is to be successful. Recent examples of behaviour change initiatives that have had significant success include policies to reduce smoking and drink-driving and to increase the use of condoms to protect sexual health.

1.2. The current Government have said that they intend to use what they describe as more "intelligent ways" to change people's behaviour and so challenge "the assumption" that central government can only change behaviour by "rules and regulation".[1] As a result, since taking office, their focus has been on non-regulatory interventions and, in particular, on the concept of "nudging", an idea made fashionable in recent years by Richard Thaler and Cass Sunstein in their book *Nudge*. The purpose of this inquiry was to consider whether the Government's approach is an effective one and whether it can be improved. In doing so, we have looked at what the "sciences of human behaviour" can show about changing people's behaviour, how behaviour change research is applied to the formulation of Government policies and whether the Government have taken sufficient steps to ensure that behaviour change policies are evidence-based and properly evaluated.

1.3. We acknowledge that there are a range of issues about the ethical acceptability of behaviour change interventions and that, in some circumstances, changing behaviour will be considered controversial. Though these issues are important, we have not explored them in detail in this report but have instead highlighted them as matters which policy makers should take into account when formulating and implementing behaviour change interventions.

Scope of the inquiry

1.4. Although the current Government have focused on "tools … to achieve behaviour change that [are] non-regulatory in character", it became clear to us during the course of this inquiry that assessing the effectiveness of non-regulatory interventions could be done only by looking at them in the context of the whole range of interventions, both non-regulatory and regulatory. We have not, therefore, restricted ourselves to considering the effectiveness of non-regulatory interventions but have examined the evidence relating to a variety of policies to change behaviour.

1.5. That is not to say that we have assessed each and every Government policy which is intended to change behaviour. Instead, we have directed our attention to the extent to which the Government are making best use of the contribution

---

1 *The Coalition: our programme for Government*, Cabinet Office (May 2010).

of disciplines such as neuroscience, psychology, sociology and behavioural economics to the formulation of policy.

1.6. To complement this broad approach, we have also undertaken two case studies. We chose these case studies on the ground that both policy areas raise significant challenges which need to be addressed urgently,[2] and for which changing behaviour will be central to success. The first looks at Government behaviour change interventions to reduce the prevalence of obesity and the second at interventions to reduce car use in order to limit CO_2 emissions. This choice of topics illustrates attempts to change behaviour first for the benefit of individuals, and second for the benefit of the wider community now and in the future.

1.7. Though, as a consequence of undertaking the case studies, this report highlights the work of the Department of Health (DH) and the Department for Transport (DfT), we believe that our conclusions and recommendations are relevant to all Government departments.

Structure of the report

1.8. In Chapter 2, we discuss some of the terminology relating to behaviour change, clarify how we use various terms in this report and briefly consider some of the ethical and other issues associated with behaviour change interventions. In Chapter 3, we look at what science can tell us about how to influence behaviour and the strength of the evidence-base. In Chapter 4, we consider the extent to which the Government make use of the available evidence about how to change behaviour and how this might be improved. In Chapter 5, we look at the potential impact of central Government's approach to changing behaviour. In Chapter 6, we consider whether the Government evaluate their interventions appropriately and discuss how evaluation could be improved. Chapter 7 sets out the findings from our two case studies.

Acknowledgements

1.9. The membership and interests of the Committee are set out in Appendix 1, and those who submitted written and oral evidence are listed in Appendix 2. The calls for evidence for this inquiry are reprinted in Appendix 3. In October 2010 we held a seminar on changing behaviour to reduce the prevalence of obesity, a note of which is set out in Appendix 4. In January 2011 we held a seminar on changing behaviour to reduce emissions from car use, a note of which is set out in Appendix 5. In February 2011 we held a seminar on the ethics of behaviour change, a note of which is set out in Appendix 6. We thank all those who assisted us in our work.

1.10. Finally, we are grateful to our Specialist Adviser, Professor Charles Abraham, Professor of Behaviour Change at the Peninsula Medical School at the University of Exeter, for his expertise and guidance during this inquiry. We stress, however, that the conclusions we draw and the recommendations we make are ours alone.

---

[2] A 2007 Foresight report, *Tackling obesities: future choices*, estimated that, without action, obesity-related diseases will cost society £49.9 billion a year by 2050. The Climate Change Act 2008 requires the UK to cut greenhouse gas emissions by 80% by 2050.

CHAPTER 2: DEFINITIONS, CATEGORISATION AND THE ETHICS OF BEHAVIOUR CHANGE INTERVENTIONS

2.1. In this Chapter we look at the terminology associated with behaviour change, including "nudging". We also discuss some factors that may be relevant to determining whether a behaviour change intervention will be publicly and ethically acceptable.

Definitions and categorisation

The "sciences of human behaviour"

2.2. There is no single science of behaviour change. A number of scientific disciplines, including neuroscience, psychology, sociology and behavioural economics, contribute to what is known about human behaviour and we refer to these sciences collectively as the "sciences of human behaviour". Behaviour change interventions apply findings, drawn from these various sciences, in order to influence human behaviour.

A "behaviour change intervention"

2.3. A wide variety of types of policies affect the way people behave.[3] Table 1 (which builds on the Nuffield Ladder of Interventions)[4] sets out a possible taxonomy, including examples, of different types of intervention. Some witnesses argued that the concept of "behaviour change intervention" could not usefully be defined on the ground that all government policies include, to a greater or lesser extent, some element of intended behaviour change.[5] Whilst we acknowledge the force of this point, and encourage policy makers always to consider the behavioural implications of a policy, we have focused on those interventions where the principal intention is to change people's behaviour. We have referred to these interventions as "behaviour change interventions".

---

3 BC 76, BC 105, BC 107, BC 108, BC 110.

4 The Nuffield Ladder of Interventions is an analysis of interventions developed by the Nuffield Council of Bioethics in a report on ethical issues in public health published in 2007. It classifies categories of public policies according to degree of intervention in the personal life of individuals. (*Public health: the ethical issues*, Nuffield Council of Bioethics (2007)).

5 BC 52, BC 76, BC 83, BC 86.

TABLE 1

Table of interventions

	Regulation of the individual		Fiscal measures directed at the individual		Non-regulatory and non-fiscal measures with relation to the individual				
						Choice Architecture ("Nudges")			
Interventions category	Eliminate choice	Restrict choice	Guide and enable choice						
			Fiscal disincentives	Fiscal incentives	Non-fiscal incentives and disincentives	Persuasion	Provision of information	Changes to physical environment	Changes to the default policy	Use of social norms and salience
Examples of policy interventions	Prohibiting goods or services e.g. banning certain drugs	Restricting the options available to individuals e.g. outlawing smoking in public places	Fiscal policies to make behaviours more costly e.g. taxation on cigarettes or congestion charging in towns and cities	Fiscal policies to make behaviours financially beneficial e.g. tax breaks on the purchase of bicycles or paying individuals to recycle	Policies which reward or penalise certain behaviours e.g. time off work to volunteer	Persuading individuals using argument e.g. GPs persuading people to drink less, counselling services or marketing campaigns	Providing information in e.g. leaflets showing the carbon usage of household appliances **Regulation to require businesses to use front of pack nutritional labelling, or restaurants to provide calorific information on menus*	Altering the environment e.g. traffic calming measures or designing buildings with fewer lifts **Regulation to require businesses to remove confectionery from checkouts, or the restriction of advertising of unhealthy products*	Changing the default option e.g. requiring people to opt out of rather than opt in to organ donation or providing salad as the default side dish	Providing information about what others are doing e.g. information about an individual's energy usage compared to the rest of the street **Regulation to require energy companies to provide information about average usage*

*Note: * Demonstrates how regulation of businesses might be used to guide the choice of individuals, thus distinguishing it from regulation which restricts or eliminates the choice of individual.*

Behaviour change and non-regulatory tools

2.4. Although several Government officials who gave evidence to us recognised that a broad range of policy instruments, including regulation and taxation, could be used to change behaviour,[6] some suggested that the Government's emphasis on non-regulatory tools had led to a tendency for behaviour change to be linked only to non-regulatory interventions.[7] Gemma Harper, Chief Social Scientist at the Department for the Environment, Food and Rural Affairs (Defra), for example, told us that in her experience, within central government, "behaviour change is very much used as a shorthand for alternatives to regulation and fiscal measures".[8] The evidence of Oliver Letwin MP, Minister of State at the Cabinet Office, also reflected this ambivalence. At one point, he used a broad definition of behaviour change intervention when he suggested that legislation was a "form of achieving change".[9] But, later, he contrasted "behavioural science" and "behavioural insights" with regulation,[10] suggesting that behaviour change policies included only non-regulatory interventions. We consider the implications of this uncertainty in the Government's approach to behaviour change in Chapter 5.

What is a "nudge"?

2.5. The Government's non-regulatory approach to behaviour change has often been described as "nudging". The Cabinet Office's Behavioural Insights Team (BIT) (see Box 7, page 32) is referred to in the media as the "nudge unit",[11] and "nudge" has been used in Government policy documents, Ministerial statements and debates in the House of Commons.[12]

2.6. The word "nudge" was originally used in the context of influencing behaviour by Richard Thaler and Cass Sunstein.[13] They define a "nudge" as

> "... any aspect of the choice architecture that alters people's behaviour in a predictable way without forbidding any options or significantly changing their economic incentives. To count as a mere nudge, the intervention must be easy and cheap to avoid. Nudges are not mandates. Putting the fruit at eye level counts as a nudge. Banning junk food does not."[14]

2.7. "Choice architecture" refers to the environment in which an individual makes choices. Changing the way options are presented or altering the social and physical environment can make it much more likely that a particular choice becomes the natural or default preference. Individuals may often be

11 For example: "David Cameron's 'nudge unit' aims to improve economic behaviour", *The Guardian*, 9 September 2010; "Nudge unit: how the Government wants to change the way we think", *The Belfast Times*, 3 January 2011; "Whitehall won't be nudged", *The Telegraph*, 17 February 2011.

12 For example: *Creating growth, cutting carbon*, Department for Transport (January 2011); HL Deb 30 November 2010 col 669; HL Deb 19 January 2011 col 824.

13 *Nudge*, Thaler and Sunstein (2008).

14 *Ibid*, p.8.

unaware of the effect that changes in the choice architecture have on their individual choices and actions. In these circumstances, nudges can be understood to have influenced the non-deliberative aspect of a person's choices or actions (see paragraph 3.4 below). Businesses often seek to prompt non-deliberative actions by their consumers through, for example, by setting default portion sizes or using product placement in films and television programmes.

2.8. We received differing accounts of the Government's use of "nudge". For example, the Sustainable Transport White Paper contrasts "nudging" with anything that forbids or restricts choice, and Norman Baker MP, Parliamentary Under Secretary of State for Transport, equated "nudging" with a broad range of non-regulatory interventions, such as the provision of bus and train timetables. Mr Letwin, however, suggested that "nudging" had to involve "prompted choice" and therefore excluded informational and promotional forms of non-regulatory intervention.[15]

2.9. In our view, interventions which may be described as "nudging" are not synonymous with, but rather are a subset of, non-regulatory interventions (see Table 1). We have drawn this conclusion because, first, not all non-regulatory interventions are nudges in the standard understanding of the term. Nudges prompt choices without getting people to consider their options consciously, and therefore do not include openly persuasive interventions such as media campaigns and the straightforward provision of information. Secondly, "nudges" themselves may be provided through regulatory means. For example, businesses may be required by regulation to provide a particular choice architecture in order to "nudge" individuals. Dr David Halpern, Head of the Cabinet Office's BIT, acknowledged this latter point when he said: "of course you can construct regulation to enable choice".[16] Similarly, Anne Milton MP, Minister for Public Health at the Department of Health (DH), said: "you can use regulation to nudge people".[17]

Interventions and ethical acceptability

2.10. Many witnesses accepted the presumption that the state should develop and pursue policies which are of benefit to individuals and to the wider population. Consequently, they should aim not only to provide conditions in which individuals can achieve those benefits but also act to make it easier for them to do so. This position allows for governments to intervene, for example, to tackle obesity and reduce harmful alcohol consumption on the ground that individual health is a good which the government have a responsibility to promote.

2.11. Even when a government is justified in taking steps to tackle a problem, the measures used to resolve the problem may not necessarily be judged ethically acceptable. The evidence highlighted two factors which might bear on the acceptability of an intervention. First, the degree to which an intervention intrudes into an individual's life. Secondly, the extent to which an intervention is covert. Witnesses also related the ethical acceptability of an

---

15 Q 703.

16 Q 47.

17 Q 705.

intervention to the extent to which it is popular with, or welcomed by, the public.

Intrusiveness

2.12. Some witnesses argued that the most intrusive interventions would require the most justification and should be deployed with particular care because they restrict or eliminate choice.[18] The Government said that they "aim to apply behaviour change theory only in ways that minimise intrusion".[19] This corresponds to the widely held classical liberal view, reflected in parts of the European Convention on Human Rights, that certain individual freedoms are intrinsically valuable and should be protected unless there is strong justification for doing otherwise—as, for example, the curtailing of freedom imposed by a prison sentence is justified because it prevents criminals from causing harm to others. The importance of protecting freedoms is a reason for testing the proportionality of proposed behaviour change interventions, but does not provide any single metric by which proportionality can be judged. As a general point, we accept that regulatory interventions which restrict choice may be judged more acceptable if there is good evidence that they will be effective in tackling an urgent issue which is having significant detrimental effects on the population.

2.13. In seeking to avoid interventions that restrict choice, the Government have focused on interventions which enable and encourage certain choices.[20] Several witnesses argued however that interventions which enable and encourage choice by affecting non-deliberative processes, such as "nudges", also involve ethical issues because they involve altering behaviour through mechanisms of which people are not obviously aware.[21] This raises an interesting question about the extent to which nudging is compatible with the Government's commitment to "extend transparency to every area of public life".[22] It also highlights the potential ethical implications of the widespread use of nudges by commercial organisations.

Transparency

2.14. Professor Luc Bovens, London School of Economics and Political Science, suggested that there were two sorts of transparency which might be relevant to behaviour change interventions. Transparency might mean telling people about an intervention directly, or it might mean ensuring that a perceptive person could discern for themselves that an intervention had been implemented. He suggested that the latter, weaker form of transparency distinguished nudges from subliminal messaging, which was widely considered to be ethically unacceptable on the ground that it was wrong to influence people in a way that they are incapable of identifying . Professor Bovens concluded that ethical acceptability did not require governments to explain that an intervention had been implemented,

---

19 BC 114.

20 The Government's written submission to the inquiry quotes from the Coalition agreement that this Government "will be a much smarter one, shunning the bureaucratic levers of the past and finding intelligent ways to encourage support and enable people to make better choices for themselves" (BC 114).

21 Q 109.

22 *The Coalition: our programme for Government*, *op. cit.*

especially as this fuller sort of transparency might limit the effectiveness of the intervention. On this view, an intervention would be acceptable provided those who were nudged had the ability to discern its implementation (even if in practice they almost never did so).[23]

2.15. The line which divides an intervention that it is impossible to discern from one that it might be possible to discern, but almost never will be, is imprecise. We note however that this weaker form of transparency is all that is required of businesses when they seek to influence our behaviour through nudges. Retailers do not, for example, tell consumers that they have designed their stores in a way that is intended to encourage purchasing of specific types of product, such as confectionery.

Ethical acceptability and "public permission"

2.16. Some witnesses suggested that the ethical acceptability of an intervention was related to its level of public acceptance, or popularity, or even the degree to which its use was based on "public permission".[24] We are not convinced by this link. For example, levels of public acceptance for interventions might improve after their introduction, as happened for example with the ban on smoking in public places.[25] Moreover, the very fact that the degree to which the public accepts, or welcomes, an intervention can change over time suggests that this is likely to be determined by assumptions about the impact of the intervention which had perhaps initially been based on incomplete information. Consequently, it may be ethically acceptable for governments to introduce a measure even though it is unpopular if there is strong evidence that it will be effective and beneficial. For example, the ban on smoking in public places was not ethically unacceptable despite the fact that it initially had only modest levels of public acceptance.

2.17. It is important to note, however, that a measure which does not have public support is, in general, less likely to succeed. Professor Mike Kelly, Director of Clinical Excellence at National Institute of Health and Clinical Excellence (NICE) drew our attention, for example, to the adverse impact of using pricing as the primary mechanism of control of alcohol in Scandinavia,[26] and Ms Milton appeared to agree when she observed that "the trouble with nannying is that it can be hectoring, and produce the opposite effect".[27]

Distinction between individuals and business

2.18. The discussion so far has focused on interventions which affect individuals. It was suggested to us that the arguments for the ethical acceptability of an intervention are different if it applies to businesses rather than individuals. Professor Thomas Baldwin, Professor of Philosophy, University of York, summed this up as follows:

> "… it is individual persons whose status as rational agents is a fundamental value of liberal society; but commercial organisations are not rational agents of this kind … So they do not merit the kind of

---

23 Appendix 6.

24 BC 81, BC 103, BC 105, Q 47.

25 Appendix 6.

26 Q 182.

27 Q 705.

> liberal freedom from interference which applies to individual persons, and there is, therefore, no principled objection to regulating them in restrictive ways. What they can nonetheless demand is that they be regulated only in ways which are effective, well-motivated, and fair; and they can argue that if the ends sought by regulation can be achieved by voluntary codes, then this approach should be tried first. So here too there is an intervention ladder which starts from voluntary codes and ends up with restrictive formal regulations. But in this case the relevant considerations are primarily pragmatic rather than principled."[28]

We agree with Professor Baldwin insofar as he points out that different considerations should apply to interventions which affect individuals directly than those which affect commercial organisations directly. The latter are more likely to be pragmatic, rather than ethical, considerations.

Conclusion

2.19. Though governments must consider the acceptability of any behaviour change intervention, there is no set of rules against which to determine whether or not an intervention is acceptable. Rather, ethical acceptability depends to a large extent on an intervention's proportionality. Proportionality can be determined by looking at the scale of the problem the intervention is designed to solve and the evidence that it will be effective in doing so. This should be weighed against ethical considerations including intrusiveness, restriction of freedom and transparency. We do not believe that levels of public acceptance or "public permission" are a necessary pre-condition of an ethically acceptable intervention, but given the potential impact of low levels of public acceptance on the effectiveness of an intervention, this must be relevant to any policy decision.

2.20. **The idea of the Government intervening to change people's behaviour will often be controversial, and so it is important that ministers are always able to explain the evidence-base of any proposed behaviour change intervention, and why it is a necessary and proportionate means of addressing a well-defined problem.**

[28] BC 66.

CHAPTER 3: UNDERSTANDING WHAT INFLUENCES BEHAVIOUR

Different kinds of evidence

3.1. Current understanding of how to change human behaviour is derived from the various sciences of human behaviour and from two overlapping types of research.[29] First, basic research, consisting of the development of theory describing the processes which shape behaviour and empirical, including experimental, tests of this theory. Secondly, applied research, which is the application of basic research to understanding how behaviour can be changed in everyday setting. When applied research is conducted using samples that are representative of the population to demonstrate effective behaviour change it is particularly relevant to policy makers. In this report, we refer to the latter form of research as "research at a population level". Of course, for evidence to be of most use it must have been evaluated rigorously and over the long-term. We discuss evaluation further in Chapter 7.

Understanding behaviour: basic research

What influences behaviour?

3.2. Basic research confirms that human behaviour is the product of a multitude of interrelated factors. This is true both of particular actions and also of patterns of behaviour over a lifetime. Given the complexity of factors underpinning behaviour, it is impossible to summarise concisely what is known about those factors and how they interact. Influences on behaviour can, however, be characterised broadly as comprising: genetics, individual thoughts and feelings, the physical environment, social interaction (with other individuals), social identity (interaction within and between groups), and the macro-social environment.

3.3. We can also say that some actions are consciously planned, or deliberative, while others are governed by automatic, or non-deliberative, processes (the focus of "nudges"). For example, a decision to buy a new car will usually be made only after much conscious deliberation (coupled with unconscious motivations), but when a car is being driven down a familiar route the driver will be able to navigate without thinking about where they are going, so acting automatically. The distinction between deliberative and non-deliberative choices and actions are described in terms of dual process theories. Professor Theresa Marteau, Professor of Health Psychology, King's College London, provided an overview in her evidence to us:

> "We can understand people's behaviour as comprising the interaction between two systems. The first is a reflective system, whereby what we do is a result of goals that reflect our values and where we're aware of what we're doing. The other system, which actually accounts for much more of our behaviour, is an automatic system, whereby we're often not aware of the impulses that have generated our behaviour. There is an increasing recognition that both these systems are very important in explaining our behaviour. Often they work synergistically, so they work

[29] We recognise that the terminology used to distinguish between different types of research is the subject of debate and that distinctions between different categories of research are not clear cut. Identifying categories is, however, necessary for the purposes of discussion.

> together well. Sometimes they work antagonistically. This is one of the reasons why, while many of us have very good intentions, we often find ourselves behaving in ways that go against our intentions."[30]

Some witnesses argued that public policy has placed too much emphasis on the reflective system or deliberative decision-making, leading to an assumption that behaviour change can only be achieved by appealing to knowledge and values and, as a result, underestimating the importance of the automatic or non-deliberative aspect of making choices.[31]

3.4. Both deliberative and non-deliberative choices and actions can be affected by social factors (such as personal interaction and interaction within, and between, groups) and the large-scale social context (such as state of the economy). Behaviour is also influenced by the physical environment in which it takes place. The ready availability of cheap and unhealthy food, for example, makes it more likely that people will consume it. Similarly, if there are very busy roads and no cycling lanes, people are less likely to travel by bike. Professor Marteau acknowledged the contribution of behavioural economics in highlighting the contextual and automatic determinants of behaviour.[32] She observed that "... behavioural economists have been extremely successful ... in highlighting to policy makers the potential behaviour change gains from going beyond information-based campaigns, which rarely effect significant behavioural change, to alter 'choice architecture' with its potential to be far more effective".[33]

Gaps in understanding

3.5. Several witnesses identified a number of gaps in understanding about human behaviour. Examples given to us included a lack of understanding about aspects of the automatic system, particularly in relation to how emotional processes regulate everyday behaviour;[34] a lack of comparative research into the limits to the transferability of behaviour change interventions across cultural differences;[35] uncertainty about how genes interact with environmental and social factors to cause behaviour;[36] and, a lack of understanding about the effect of social dynamics on behaviour.[37] Other witnesses commented on the challenges involved in integrating the numerous theories of behaviour which were emerging from across the range of sciences of human behaviour. In this regard, Professor Michie, Professor of Health Psychology at University London, argued that, though there had been advances in multi-disciplinary working, more work needed to be done.[38]

Applied research at a population level

3.6. Whilst theoretical understanding of behaviour change appears to be strong, several witnesses drew our attention to the comparative lack of research at a

38 Q 88.

population level.[39] NICE, for example, commented in relation to public health interventions that:

> "The majority of *experimental* evidence about behaviour change relates to individual approaches, and comes largely from disciplines within psychology ... much of the evidence is limited and it is rare that evidence can be extrapolated or generalised from those interventions to the wider population with confidence and without caveats ... There is less experimental evidence about what works to influence behaviour when working with or at community or population levels."[40]

They further noted that there is "a marked lack of information about what works to change behaviour at policy level".[41]

3.7. Richard Bartholomew, joint head of the Government Social Research service (GSR), said that though there were theories explaining why people behaved in certain ways there was a dearth of clear evidence about how to translate that into change.[42] The British Psychological Society (BPS) agreed to some extent, noting that further research was required "to develop cost-effective strategies that can be adopted and utilised in practice".[43] The Sustainable Development Commission said that there needed to be more "understanding of what interventions work best in practice".[44]

3.8. Our impression that there is relatively little evidence of the effectiveness of particular behaviour change interventions at a population level has been reinforced by how few substantial responses we received following our request for examples of successful interventions. A number of witnesses also alluded to a lack of evidence about the cost-effectiveness of interventions[45] and to a disappointing lack of long-term data against which to judge the effectiveness of interventions over sustained periods.[46]

3.9. Businesses, on the other hand, have demonstrated success at changing behaviour patterns on a large scale through measures like advertising and product promotion.[47] However, governments can face greater challenges than businesses in changing behaviour. Government may often wish to establish new behaviour patterns, such as getting people to take more exercise, or helping people to break ingrained habits, like smoking cigarettes. This is difficult to achieve. By contrast, businesses normally seek to sell people those things that they like and want.

Conclusion

3.10. **There is a lack of applied research at a population level to support specific interventions to change the behaviour of large groups of people (including a lack of evidence on cost-effectiveness and long-term impact). This is a barrier to the formulation of evidence-based**

policies to change behaviour. To address this problem, the Government will need both to evaluate their own behaviour change interventions rigorously and establish new evidence by commissioning and funding more applied behavioural research on this scale. Recommendations are made in Chapters 4 and 6 about how this can be achieved.

CHAPTER 4: EVIDENCE-BASED POLICY

Are Government policies evidence-based?

4.1. Behaviour change interventions based on evidence about what works are more likely to be successful than those which are not. We have concluded that there is marked lack of research at a population level (see paragraph 3.11 above). This leads us to two further conclusions: first, the Government should take steps to ensure that this sort of research is undertaken; and, secondly, policies should, insofar as is feasible, reflect the evidence that is, or becomes, available.

Examples of evidence-based policies

4.2. We were given a number of examples of policies which were, to a greater or lesser extent, designed to reflect the available evidence. These included smoking cessation services (see Box 1, page 20), the Health Trainers Intervention (see Box 15, page 49) and energy efficient products policy (see Box 6, page 27).[48] A common feature of these examples is that they were all developed by, or in consultation with, academics with expertise in changing behaviour.

BOX 1

NHS Centre for Smoking Cessation and Training

The NHS Centre for Smoking Cessation and Training (NCSCT) was set up after implementation of Stop Smoking Services (SSSs) across the United Kingdom. The Centre was established in 2009 "to assess training needs, develop training standards, pilot and evaluate training programmes, develop a certification system for smoking cessation practitioners, deliver the training across England and continuously evaluate it, develop an accreditation system for trainers and courses and contribute to national policy development".[49] Professor Michie noted that the team at the NCSCT undertook systematic reviews and looked at the Cochrane evidence reviews, alongside analysis of DH data on smoking cessation. That evidence was then used to form the basis of outcome measures and interventions which have been put into practice. Assessment and training have been continually monitored and revised in order to learn from experience and to take account of scientific advances, new evidence and contextual changes. The training is evaluated by its impact on stop smoking success rates, using comparisons of success rates of practitioners against controls. Participants' feedback on the training as well as their self-reported confidence in their competences are also assessed and used to evaluate training.[50]

Examples of policies which were not evidence-based

4.3. We were also given examples of (previous and current) Government policies which were not based on evidence. Two of these, minimum alcohol pricing and the Act on CO_2 campaign, are described below (see Boxes 2 and 3, page

[48] We note that the Health Trainers programme had substantial flaws in its evaluation and so must be considered poorly designed in that regard; however, its design did reflect the available evidence.

[49] BC 27.

[50] *Ibid*.

21). The case studies provided further examples: witnesses observed that those commissioning weight management interventions at a local level were often insufficiently knowledgeable to make evidence-based decisions (see paragraph 7.24 below), and the DfT policies in relation to sustainable transport were said not to reflect the evidence about the effectiveness of disincentives to car use (see paragraph 7.36 below).

BOX 2

Act on CO_2

'Act on CO_2' was a cross-Government brand launched in 2007 with the aim of getting people to reduce their carbon footprint. It included a range of communications activities relating to home energy usage, smarter driving and car purchasing. The Sustainable Development Commission noted that the campaign 'Act on CO_2' had been criticised for "failing to communicate effectively with the public, for being too negative in its messages, and for not including any supporting interventions to address the barriers to adopting low carbon behaviours".[51] The campaign is an example of how policy was not based on the available evidence because:

- It involved only the provision of information. The Green Alliance note that it is now widely known "that information deficit models in practice rarely work: information alone is insufficient to lead to action".[52]
- It did not include a range of interventions within a multi-component package to tackle a number of causes of behaviour and barriers to change.

BOX 3

Alcohol pricing

Professor Kelly and Professor Michie told us in November 2010 that there was good evidence about the effectiveness of alcohol pricing on reducing alcohol related harm but that it had not fed through to Government alcohol policy. Subsequently, in January 2011, the Home Office announced a ban on the sale of alcohol below the rate of duty plus VAT.[53]

This policy has been criticised however for not reflecting the evidence about the level at which pricing affects behaviour. Requiring alcohol to be sold for no less than the rate of duty plus VAT means that minimum price for a unit of beer would be around 21p and for spirits around 28p. The NICE guidance on preventing harmful drinking published in 2010 shows that at the minimum price level proposed by the Government, a reduction in consumption of between 0.1% and 0.4% could be expected. However, a minimum price of 40p per unit would reduce consumption by 2.4%, while minimum prices of 50p and 60p would reduce consumption by 6.7% and 11.9% respectively.[54]

Reasons why policies may not be evidence-based

4.4. There are two reasons, in addition to a lack of applied research at a population level (see paragraphs 4.9–4.16 below), why policies are not always

[51] BC 83.

[52] BC 107.

[53] HC Deb 18 January 2011 col 34WS.

[54] *Alcohol use disorders—preventing harmful drinking*, NICE (2010).

based on the best available evidence: ministers are unaware of relevant evidence, or they are aware of the evidence but choose not to reflect it in policy decisions.

4.5. Where ministers are unaware of relevant evidence, this is a failure of the process by which the Government are informed about research findings—a process often described as the translation of research.[55] We were given a number of reasons for the breakdown of this process: a lack of significant involvement of Government social scientists and economists; an absence of adequate mechanisms for communication between policy makers and external researchers; an inadequate understanding of behavioural research by policy makers; and an absence of adequate mechanisms for sharing knowledge within Government.[56] We consider how to address these problems in paragraphs 4.17 to 4.42 below.

4.6. Even where ministers are aware of relevant evidence, other factors may lead them to disregard it. This appears to have been the case with current alcohol pricing policy (see Box 3, page 21). Norman Baker MP, a Minister at the DfT, explained: "evidence is best used to inform policy … but not to drive it in an unreconstituted way"; the Government "have to make choices based not just on the evidence-base … but also on the political objectives of the Government at a particular time, and to ensure fairness across the country".[57] Other considerations might include immediate reaction to events, judgements about ethical acceptability, cost and cost-effectiveness. These considerations might justifiably affect the extent to which a policy is based on the available evidence.

4.7. **We acknowledge that there will be occasions when it is legitimate for a government not to implement behaviour change interventions for which there is good evidence of effectiveness. In these circumstances, however, we believe that ministers have a responsibility to explain why they have decided not to do so.**

4.8. **We agree with the principle, stated in the Government's *Principles of Scientific Advice*, that ministers should explain publicly their reasons for policy decisions, particularly when a decision is not consistent with scientific advice and, in doing so, should accurately represent the evidence. This places a responsibility on scientists and social scientists within government to ensure that ministers are provided with accurate and up-to-date advice on the available evidence about how to change behaviour so that they can identify where and why they are not basing policies on that evidence.**

Addressing the barriers to evidence-based policy

Applied research at a population level

4.9. In paragraph 3.8, we conclude that there is a lack of applied research at a population level. Mr Bartholomew of the GSR told us about the "frustration" of policy makers at the fact that, although there is very good academic research, researchers often do not take the final step and answer

---

55 BC 83, Q141.

57 Q 733.

the question "what would you do about it?"[58] We were provided with a number of reasons why this sort of research is lacking.

Poor evaluation of Government behaviour change interventions

4.10. It is clear that if the Government's attempts to change behaviour at a population level were rigorously evaluated, this would provide evidence about effective interventions. Evaluation is discussed in Chapter 7.

Funding and research capacity

4.11. There was disagreement in the evidence we received about whether, on the one hand, there is research capacity to conduct research at a population level but insufficient funding available to support it or whether, on the other hand, there is simply insufficient research capacity, so that further funding would make little difference. The majority of the evidence we received on this issue related to public health research.

4.12. The BPS suggested that the problem was one of funding: there would be more research at a population level if there were more "funding [of] evidence-based translational research to develop cost-effective strategies that can be adopted and utilised in practice".[59] Many other witnesses agreed. NICE argued, for example, that "the UK's capacity for this kind of research is good with much potential" (albeit "disparate and often highly individualistic") but "there is not enough funding available for behaviour change evaluation ..."[60] Professor Karen Lucas, Department for Transport Studies at the University of Oxford, agreed, stating: "... there is sufficient research expertise, but insufficient research funding and not enough interdisciplinary interaction on this subject ..."[61]

4.13. In relation to funding, Dr Halpern and Professor Michie both highlighted the findings of a 2006 report by the UK Clinical Research Collaboration which estimated that 2.5% of health research funding is spend on prevention and just 0.5% on primary behavioural factors, despite the fact that understanding how to change behaviour is of significant potential benefit.[62] DH responded: "research with relevance to behavioural factors is supported through most of our funding streams" but "spend on this cannot be disaggregated from total spend across the portfolio".[63]

4.14. Professor Dame Sally Davies, Director General of Research and Development and Chief Scientific Adviser for DH and the NHS, suggested that the block to behavioral research was not a lack of funding but rather a lack of research capacity. Other witnesses agreed that research capacity was the more important issue.[64] Professor Marteau and Dr Haynes, for example, noted in relation to health research that:

> "At the academic level and for health-related interventions, the development of [National Institute for Health Research] and the National

Prevention Research Initiative means that there is probably now as much money as there is capacity to develop and evaluate interventions."[65]

Professor Erik Millstone, Professor in Science and Technology Policy at the University of Sussex, said, more broadly, that "... there is very little capacity in the UK to conduct research that is of practical relevance".[66] Dr Tim Chatterton, University of the West of England, agreed that there was scope to build greater capacity in academia for this kind of work.[67]

4.15. We were, nonetheless, provided with a number of examples of how the Government are providing funding for the development of research at a population level in collaboration with the research councils.[68] We set out two of them below (see Boxes 4 and 5, page 24).

BOX 4

The Sustainable Behaviours Research Groups: Defra and the ESRC

The Sustainable Behaviours Research Groups were begun and funded by Defra, the Economic and Social Research Council (ESRC) and the Scottish Government in order to enhance the evidence-base in this field and specifically to develop research in a form that could be used by policy makers. The groups are researching issues including the rebound effects of behavioural changes, the role of routine and habit, and circumstances which facilitate or constrain sustainable behaviour. Both research groups are involved in evidence synthesis and investigating issues relating to the use of evidence by policy officials.

An advisory group has been established, made up of the funders, leading academics from the sustainability field and two independent members (one representing businesses and the other the third sector). This group provides a challenge function from the different fields of expertise and will optimise investments by broadening the reach of findings. Defra has also undertaken a policy timeline mapping exercise so that findings feed into policy objectives.

BOX 5

National Prevention Research Initiative (NPRI): DH and the MRC

DH Policy Research Programme spent £34 million in 2009–10. As part of this the department provides funding to the NPRI alongside the devolved governments and third sector organisations. The aim of the NPRI is to develop and implement successful, cost-effective interventions that reduce people's risk of developing major diseases by influencing their health behaviours. The NPRI has so far committed £33 million to research projects looking at the use of alcohol and tobacco, and diet and physical activity. The most recent calls for research proposal focus funding on cross-disciplinary research that has a large potential influence on population health.

In February 2011, Anne Milton MP, Minister for Public Health, established an National Institute for Health Research School for Public Health Research in order to increase the evidence-base for effective public health practice. DH has also established a Policy Research Unit on Behaviour and Health which will focus on behaviour such as diet and physical activity.

Conclusion

4.16. Whilst we welcome efforts by some departments to work collaboratively with academics to develop behavioural research, further capacity to conduct research at a population level needs to be developed. Funding for research of this kind is a necessary in order to build this capacity. The long-term evaluation of interventions using population-representative samples will be expensive and it will be necessary for funding to be made available before this work can be carried out. **We urge ministers to consult their departmental Chief Scientific Advisers (CSAs) about whether the amount of money spent on applied behaviour change research at a population level is sufficient to meet their policy needs.**

Translation of research

Role of Government scientists

4.17. Government scientists have an important role in ensuring that academic research is used to inform policy decisions. Professor Kelly noted the need for "a specialist way of making that link"[69] between researchers and policy makers, in order to bring the two very different cultures together. This should be core work for Government scientists.

4.18. A cross-departmental social science resource is provided by the Government Economic Service (GES) and the Government Social Research service (GSR) which are responsible for giving "evidence-based advice to support the rationale, objectives, appraisal, monitoring, evaluation and feedback to support effective policy making and delivery".[70] Government economists and social scientists are civil servants who work within particular Government departments in order to ensure that policies formulated within their department are "guided by the best available analysis and evidence".[71] Mr Bartholomew, joint head of the GSR, described his role within his department as ensuring that policy makers were made aware of the most up-to-date scientific findings, including those about behaviour change, in order to enable effective evidence-based policy.[72] The Government Social Research Unit and Government Economic Service Team in HM Treasury (now the combined Government Economic and Social Research Team) provide the professional support and leadership for social researchers and economists across all government departments.[73]

The Government Chief Social Scientist

4.19. The Government's Chief Social Scientist (CSS), the head of the social research profession in government, has in the past been an independent expert in the social sciences. The post has, however, most recently been filled by two government social scientists from the Department of Education and the Department for Work and Pensions.[74] Professor Sir John Beddington,

---

69 Q 159.

70 BC 24.

71 *Ibid.*

72 Q 18.

73 *Ibid.*

74 Q 45.

Chief Government Scientific Adviser (GCSA), confirmed that the CSS is a job currently "divided between two civil servants".[75] The CSS sits on the Heads of Analysis (HoA) group alongside the heads of the other analytical professions, including the GCSA in his capacity as Head of Science and Engineering Profession, and heads of profession for economics, statistics and operational research. The role of the HoA group is to "provide leadership to all analysts in government and champion first rate analysis across government". [76]

4.20. The majority of government departments also have a departmental CSA who works within their department to "ensure that science and engineering are at the core of decisions within departments and across government".[77] The network of departmental CSAs works closely with the GCSA through the Chief Scientific Advisers Committee, one of the functions of which is to facilitate communication on high profile science issues and those posing new challenges for government.[78] We note however that departmental CSAs belong to a different profession from that of the social scientists working within their departments and it is not clear what responsibility CSAs have for the performance and development of social scientists. Sir John Beddington confirmed, when giving evidence to this Committee on science spending in May 2011, that the Government "do not have anybody as a Chief Scientific Adviser who has a background in social research at the moment".[79]

4.21. Professor Marteau was critical of the GES and GSR and suggested they were not doing enough to drive forward an agenda of evidence-based policy making.[80] Academics from the Faculty of Humanities and Social Sciences at the University of Bath also noted that "the profile, status and consequent influence of Government Social Research staff in informing the policy strategy and delivery ... varies across different departments".[81] We were also concerned to hear that current capacity within Government with regard to behaviour change expertise was "variable" and that though a few departments have some notable expertise, others have less or none at all.[82]

4.22. The limited reference to the GES and GSR in the evidence we received suggests to us that they are not as effective as they might be. We also note that evidence submitted to us by the GES and GSR provides little detail about how they intend to promote evidence-based policy.

4.23. Government scientists and social scientists have an important role to play in facilitating the translation of behaviour change research and in remedying the problems with translation which we have identified. **We recommend therefore that, at the earliest opportunity, the Government appoint a Chief Social Scientist (CSS) who reports to the GCSA and is an**

independent expert in social science research to ensure the provision of robust and independent social scientific advice.

4.24. **We further recommend that the Government consider whether existing mechanisms for the provision of social scientific advice, in particular advice on behavioural science, are fit for purpose. This should include consideration of how departmental CSAs and social scientists within departments can best work together to provide up to date social scientific advice to support evidence-based behaviour change interventions.**

Better links between the academic and policy making communities

4.25. Many witnesses highlighted the need for closer working between behaviour change researchers and policy makers to ensure that policies are properly informed by relevant evidence. Some suggested that, given the complexity of the area, researchers should be involved in intervention design from the beginning.[83] As we have already observed, the examples of interventions which were properly evidence-based were notable for their use of external expertise. The BPS were brought into DH to design the Health Trainers programme (see Box 15, page 49), and Defra's energy efficient products policy was developed in collaboration with a broad range of experts (see Box 6, page 27).

BOX 6

Energy efficient products

Defra's energy efficient products policy was developed by a team of behavioural economists, social researchers and communications experts.[84] The policy engaged the manufacturers and retailers to change the context in which the products were sold, using evidence about the importance of the environment in influencing people's decisions. Drawing on research into consumer purchasing patterns, interventions were also designed to raise the salience of energy efficiency at the point of decision making through labelling and communications campaigns. Between 1996 and 2007 the percentage of fridges and freezers purchased by consumers which were A-rated for efficiency increased from 5% to over 70%.[85]

The Sustainable Development Commission described the policy on energy efficient products as evidence-based and, as a result, multi-faceted, making use of a number of different types of interventions, including communication and information provision alongside requirements on industry.[86]

4.26. Other efforts to involve behavioural scientists in the development of policy are also being made. We were told that one of the functions of BIT was to bring in external experts on an *ad hoc* basis and invite the relevant departments to meet them.[87] The departments also provided some examples. DH had developed an arrangement with BPS for the provision of health

83 BC 38, BC 105, BC 108.

84 Q 71.

85 BC 114, Q 71.

86 BC 83.

87 QQ 13, 703.

psychologists to advise on evidence about behaviour change.[88] Though that arrangement has come to an end, Dr Sunjai Gupta, Head of Public Health Strategy and Social Marketing at DH, said that his team continued to include a health psychologist.

4.27. Gemma Harper, Chief Social Scientist at Defra, told us that her department work closely with their departmental scientific advisory council and expert committees. They were also working with the Department of Energy and Climate Change (DECC) on proposals for a social science orientated expert committee in order to ensure that they had the best advice, external to government, on behaviour change.[89] Liz Owen, Head of Customer Insight at DECC, said that, in relation to development of energy efficiency policy, her department was engaging with external experts. She admitted, however, that this was an area in which DECC had "more to do".[90]

4.28. Links are also being made with the research community through internships and research placements. Dr Rachel McCloy, a psychologist from the University of Reading, was an ESRC-funded Public Sector Research Fellow based in HM Treasury. She has been involved in developing a Behavioural Science in Government Network and compiling a database on work across Government (see paragraph 4.38 below).[91] Dr McCloy told us that arrangements such as her fellowship were "very useful in bringing academics in" so that they could see "what it's like on the other side of the table".[92] Dr Chatterton, an ESRC-funded placement fellowship at DECC,[93] told us that placements were "a great way forward". His placement had "opened [his] eyes to how big the gulfs are between the world of government policy making and the world of academia".[94]

4.29. Though many witnesses supported these mechanisms for linking behavioural scientists and policy makers more closely, some suggested that more needed to be done.[95] The Green Alliance, for example, said that placements and *ad hoc* consultation would not be enough for "government to keep on top of the wealth of academic progress, and to ensure the latest research is impacting on decision-making" but that a "greater dedicated resource" was required.[96]

4.30. **Departmental CSAs, whether or not they have experience of the sciences of human behaviour, should be responsible for establishing and maintaining contacts with leading behavioural scientists with expertise relevant to their policy areas and for consulting them as necessary.**

Behavioural insights for policy makers

4.31. The final link in the translation of research is that between scientists and policy makers. A number of witnesses suggested that policy makers

themselves should become more familiar with behavioural insights and their potential importance for improving policy.[97] Dr Halpern said that a mark of success for BIT would be widespread expertise in behavioural approaches within five years and that BIT was working with the head of profession for policy making to embed insights about behaviour change across Whitehall. We received, however, no indication of how this would be achieved.

4.32. **We recommend that the Cabinet Secretary, in consultation with the GCSA and CSS, once appointed, should take steps to ensure that civil servants with responsibility for policy making have the necessary understanding of the importance of changing behaviour and can identify the most appropriate people to consult in their own departments about the development of behaviour change interventions.**

Guidance to policy makers

4.33. There are a number of resources available to help policy makers understand behaviour change and design policies which take on board behavioural insights. These include the MINDSPACE report, produced by the Cabinet Office and the Institute for Government;[98] a review by the GSR which discusses models of behaviour change and provides a framework for designing interventions based on their models;[99] a report by the Central Office of Information which also summarises models of behaviour change;[100] NICE public health guidance on behaviour change at population, community and individual levels;[101] and Defra's framework for pro-environmental behaviours, the four Es[102] (adapted by the MINDSPACE report into the 6 Es).[103]

4.34. Despite this wealth of material, witnesses observed that none of the guidance provided an accessible, multi-disciplinary framework for designing behaviour change interventions. Furthermore, the sheer quantity of guidance, none of which covered everything and much of which was too detailed, was potentially confusing and unhelpful.[104]

4.35. **We recommend that the Cabinet Office, in consultation with the CSS, once appointed, consider how to consolidate the available guidance in a form which is evidence-based and accessible to policy makers.**

4.36. **We further recommend that NICE updates its 2007 Behaviour Change Guidance and considers whether accessible, multi-disciplinary guidance could be provided in relation to health-related behaviour change policies, particularly to offer more explicit advice on how behaviour change techniques could be applied to reduce obesity, alcohol abuse and smoking.**

103 *MINDSPACE*, *op. cit.* p. 9.

104 BC 9, BC 52, BC 86, BC 105.

Sharing knowledge across government

4.37. Several witnesses identified a need for better coordination of what is known about behaviour change within and across government.[105] GES and GSR, for example, said that there should be:

- more shared practice in terms of what works and what does not work in influencing behaviour; and
- mechanisms for bringing people working in this area across government together to promote good practice as well as cost-effectiveness.[106]

4.38. The primary mechanism for achieving better co-ordination appears to have been Dr McCloy's work.[107] The Behavioural Science in Government Network is to be supported by a "Civil Pages community" which will act as a "forum for the sharing of relevant information on work in this area across government ... [incorporating] an inventory of work on behaviours across Government ... [and] extant reports on behaviour change, and information about relevant events [and] research developments".[108] Dr McCloy said that the Network had been successful in bringing people together.[109] This view was supported by Ms Harper.[110] Dr McCloy's appointment as Research Fellow is however time-limited and it is unclear how her work will be continued. When we asked Mr Bartholomew, he said that GES and GSR were "looking at other options for fellowships".[111] Several witnesses were concerned about detrimental consequences arising from a lack of continuity of Dr McCloy's work.[112]

4.39. A function of BIT is to "foster more inter-departmental discussion about the effectiveness of different means of changing behaviour".[113] The Government told us that a number of departments, including Defra, DECC and DH, have already contributed to Government understanding and knowledge about behaviour change and that heads of professions had a role in disseminating that knowledge.[114] We were also told that government officials, particularly members of the GES and GSR, sometimes went into other departments to help disseminate knowledge.[115]

4.40. It is not clear how, or how well, these different resources work together—how, for example, the work of BIT relates to the Behavioural Science in Government Network, or how departmental scientists and policy makers participate in either. Andrew Lee, Director of the Sustainable Development Commission, also argued that "there is not nearly enough connecting up between the Cabinet Office and Defra, which have now developed quite a lot of expertise in this area. We had a lot of feedback in our work about officials

not knowing where the evidence was, or what other people were doing".[116] The Central Office of Information agreed that the structures to join up the different silos of expertise were not yet in place, though also noted that many of these areas of expertise were focused on particular disciplines. A mechanism to join up experts across disciplines was needed to ensure that interventions were strategically planned, and they suggested the creation of a cross-government network.[117]

4.41. There are a number of different mechanisms in place for sharing knowledge but too much activity can make sharing knowledge more difficult rather than easier. **We recommend that the Cabinet Office, together with the GCSA and CSS, once appointed, review the current mechanisms for sharing knowledge about behaviour change among Government departments with a view to introducing a more streamlined structure.**

4.42. **We recommend further that this revised structure should involve the continuation of work begun on the "inventory of behaviours" in order to establish an archive of behaviour change interventions. This archive should provide accounts of the evaluation of the interventions and include unsuccessful as well as successful interventions.**

[116] Q 601.

[117] BC 76.

CHAPTER 5: THE GOVERNMENT APPROACH TO CHANGING BEHAVIOUR

5.1. In their evidence to us, the Government emphasised three aspects of their general approach to policy making which impact on the use of behaviour change interventions: a preference for non-regulatory policy tools, engagement with a range of organisations through partnership working, and a greater role for local authorities. In this Chapter, we consider the implications of each of these aspects on the effectiveness of interventions to change behaviour.

An emphasis on non-regulatory interventions

5.2. The Government's emphasis on non-regulatory behaviour change interventions can be traced back to the coalition agreement:

> "The Coalition's *Programme for Government* rejects 'the assumption that central government can only change people's behaviour through rules and regulations' and promises that 'our government will be a much smarter one, shunning the bureaucratic levers of the past and finding intelligent ways to encourage, support and enable people to make better choices for themselves'."[118]

5.3. The Minister, Oliver Letwin MP, echoed this sentiment, noting that "over very many years, governments of different persuasions have assumed that the way you achieve change ... is to legislate and then administer".[119] He said that while "there is a considerable place for legislation and regulation ... where we can achieve an effect that otherwise you would achieve by legislation, either directly or through nudge, without having to regulate, we prefer that route ..."[120] BIT was established in order to help achieve this (see Box 7, page 32 below). Dr Halpern, Head of BIT, agreed that governments have tended to use "a relatively limited menu" of policies to influence behaviour and that this meant that an "additional suite of approaches" which reflected a "more nuanced model of what actually drives behaviour change" had been missed.[121]

BOX 7

The role of the Behavioural Insights Team

BIT, a small team of civil servants and academics, is based in the Cabinet Office and led by Dr David Halpern. BIT has a steering group chaired by Sir Gus O'Donnell, Cabinet Secretary, and works with a variety of external experts, including Professor Richard Thaler, co-author of *Nudge*. BIT was established with a two-year sunset clause and so will cease to exist in the summer of 2012.

At present the team is working, in particular, on promoting organ donation, smoking cessation, car labelling, food hygiene and charitable giving. The commonality between the projects, according to the Government, is that they do not involve regulating and involve both prompted choice and partnership with the private sector.[122]

---

[118] BC 114.

[119] Q 703.

[120] Q 706.

[121] *Ibid*.

[122] Q 703.

Dr Halpern identified the origins of what is now BIT in "deregulatory thrust", in part linked to the Better Regulation Executive.[123] He understands the team's role as raising awareness of "less cognitive, less familiar approaches" as alternatives to legislation, pricing mechanisms and advertising and social marketing.[124] Mr Letwin said that BIT was created in order to help Government departments think about "non-regulatory means of achieving behaviour change".[125]

5.4. Mr Letwin gave four reasons for emphasising a non-regulatory approach: effectiveness, cost-effectiveness, less rigid imposition on individuals and reduced burden on business.[126] We discuss the latter within the section on voluntary agreements (see paragraph 5.20 below).

The Government's arguments for a non-regulatory approach

The effectiveness of non-regulatory and regulatory approaches in isolation

5.5. Occasionally, non-regulatory approaches might be the only reasonable way to achieve behaviour change. Professor John Britton, Director of the UK Centre for Tobacco Control Studies, gave an example: "we cannot legislate to stop people smoking in their home but we can educate and nudge people to change".[127] In some policy areas, particularly crime prevention, legislation might already prohibit certain behaviour and the challenge is to achieve greater compliance. In these cases, further regulation may not be a realistic option.

5.6. Aside from these sorts of circumstances, we were given no examples of significant change in the behaviour of a population having been achieved by non-regulatory measures alone,[128] confirming the view of some witnesses that non-regulatory measures in isolation could have little or no effect and that the most effective means of changing behaviour at the population level was a package of different types of interventions. Findings from our case studies supported this view, as did Defra's work on energy efficient labelling (see Box 6, page 27). Professor Michie also observed:

> "... usually examples of legislation being maximally effective are when there is also work done on persuasive communication—for example, seatbelts and the smoking ban. If these legislative measures had been taken out of the blue, I don't think they would have been as effective as having a big communications campaign at the same time. On the other hand, if one just did the persuasive communication, it wouldn't have been effective."[129]

---

123 Q 19.

124 Q 8.

125 Q 703.

126 Q 703.

127 Q 153. There has of course been legislation to encourage people to stop smoking, such as the Health Act 2006 which banned smoking in enclosed public places. This legislation appears to have had an effect on the numbers of individuals who smoke, and consequently who smoke in their homes. Professor Britton was instead referring to a direct ban on smoking in homes.

128 We were given the example of the relatively small changes made to letters sent out by Her Majesty's Revenue and Customs (HMRC) which seem to have had a substantial impact on the levels of response to tax collection letters. We note however that HMRC cannot be sure that the increased response was wholly a result of changes to letters, as other changes to the tax collection process were made simultaneously (BC 114).

129 Q 129.

5.7. Similarly, as Professor Michie suggested, regulatory measures may also be less effective when used in isolation rather than in a comprehensive package of interventions. Professor Kelly and Professor Britton agreed that legislation is likely to be more effective when the public understand the reasons behind it; this means that non-regulatory measures should be used as a means of "explaining and promoting the idea beforehand".[130] Professor Kelly cited the "Clunk Click" marketing campaign encouraging people to wear seat belts, which accompanied seat belt legislation, as an example of such a measure.[131] Mr Letwin made the further point that regulatory measures could sometimes have unintended consequences: that sometimes governments "have discovered, to their horror, that the effect that they sought to achieve has not been achieved and that instead some other effect has occurred—perhaps benign, perhaps counterproductive".[132] Professor Kelly agreed and referred to the counterproductive effects of using strict controls on the price and availability of alcohol in Scandinavia (see Box 3, page 21).[133]

5.8. Nudges are a subset of non-regulatory interventions (see Table 1, page 9) and the points made above about non-regulatory interventions apply. Several witnesses told us that, though some nudges reflect experimental evidence about what influences behaviour, they would be unlikely to have a significant effect if used in isolation. Dr Anable, University of Aberdeen, said in relation to reducing car use, for example, that "nudging will achieve nothing ... over the longer term [and] at the bigger scale".[134] Professor Ray Pawson, Professor of Social Research Methodology, University of Leeds, agreed that "sustained behavioural change is difficult to accomplish and requires more than a well aimed 'nudge' in the right direction".[135] Sara Eppel, Head of Defra's Behaviour Change Centre of Excellence, also said in relation to nudging: "I don't speak up its success … you often need some behavioural intervention to make your policy easier to implement, but you may also end up going for the much harder and faster policies at the end of the day".[136]

The cost-effectiveness of non-regulatory interventions

5.9. The Government have suggested that non-regulatory interventions are a more cost-effective way to change behaviour. Mr Baker, for example, said that "... in terms of value for money, the use of nudge and encouragement, apart from being sometimes as effective as regulation, can also be far more cost-effective for the public purse".[137] The MINDSPACE report also suggests that non-regulatory policy tools could lead to better outcomes at a lower cost.[138] In contrast, Professor Marteau and others, writing for the British Medical

---

130 Q 158.

131 Q 164.

132 Q 703.

133 Q 182. Professor Kelly noted that "in certain parts of Scandinavia, this has brought down consumption in terms of people buying alcohol, but it's led to an increase both in people brewing their own and indeed in smuggling".

134 Q 585.

135 BC 6.

136 Q 299.

138 *MINDSPACE*, *op. cit*, p. 10

Journal, noted in relation to nudges that "[lower cost] cannot be assumed because the cost-effectiveness of nudges has not been evaluated".[139]

5.10. Effectiveness is a necessary prerequisite of cost-effectiveness. If an intervention has no effect then it cannot be cost-effective. Given Mr Letwin's view about nudging that "it is of course open to question whether any of this will have any effect whatsoever",[140] we find it surprising that the Government judge that they are in a position to assert that nudging is generally cost-effective.

Respecting the freedom of the individual

5.11. Finally, the Government argue that non-regulatory approaches are more "respectful of the freedom of the individual".[141] We believe that this is misleading. For example, there is a difference between regulation of the individual and regulation of businesses and only the former will tend to restrict the freedom of the individual (see paragraph 2.18 above). Indeed, an argument can be made that regulating businesses might increase the freedom of individuals by preventing businesses from influencing their behaviour and so creating a more neutral environment in which to make choices. We also draw attention to our conclusion in paragraph 2.20 that the Government should be able to explain why an intervention is a necessary and proportionate means of tackling a problem.

The need for a range of interventions

5.12. Whilst the Government have emphasised non-regulatory approaches, Mr Letwin acknowledged that there were circumstances when regulation was appropriate. The Government, he said, were not arguing "that we can substitute behavioural science and behavioural insights for the entire panoply of regulation. It may well be that there are all sorts of domains in which regulatory action is required to make major shifts—either only regulatory action, or regulatory action allied to other things".[142] As we have said (in paragraph 2.4 above), however, the evidence of officials suggests that the understanding that regulation has its place is not fully appreciated throughout Government departments. Ms Eppel, Head of Sustainable Products and Consumers at Defra, for example, told us:

> "… at the moment, we're giving a much bigger priority to looking at whether behaviour change [non-regulatory and non-fiscal measures] can contribute, because the Government is less willing to do regulation and that is a stated objective ... previously, we'd probably have looked at regulation more methodically".[143]

5.13. **In general, the evidence supports the conclusion that non-regulatory or regulatory measures used in isolation are often not likely to be effective and that usually the most effective means of changing behaviour at a population level is to use a range of policy tools, both regulatory and non-regulatory. Given that many factors may influence behaviour, this conclusion is perhaps unsurprising.**

---

[139] *Judging Nudging: can nudging improve public health*, Marteau et al (BMJ, 2011).

[140] Q 703

[141] BC 114, QQ 54, 58, 77.

[142] Q 715.

[143] Q 294. See also Professor Dame Sally Davies' comments in Q 355.

5.14. **We welcome efforts by the Government to raise awareness within departments of the importance of understanding behaviour, and the potential this has for the development of more effective and efficient policies. We are concerned, however, that emphasising non-regulatory interventions will lead to policy decisions where the evidence for the effectiveness of other interventions in changing behaviour has not been considered. This would jeopardise the development of evidence-based, effective and cost-effective policies.**

5.15. **We therefore urge ministers to ensure that policy makers are made aware of the evidence that non-regulatory measures are often not likely to be effective if used in isolation and that evidence regarding the whole range of policy interventions should be considered before they commit to using non-regulatory measures alone.**

Partnership Working

5.16. The Government told us that "the involvement of private and Voluntary, Community and Social Enterprise sector organisations will be crucial" when they are trying to change behaviour.[144] Much of the evidence we received highlighted the benefits of partnership working, where Government initiatives are supported by other organisations, and suggested that the Government could do more to work with industry, the third sector and local communities to deliver multi-faceted behaviour change interventions through the most appropriate messengers.[145]

5.17. Numerous reasons were provided in favour of partnership working: that interventions undertaken by local communities and social enterprises were an effective way to change behaviour because those who are affected by an issue are the most likely to be able to solve it;[146] that individuals often respond best to messages about behaviour from those within their local community;[147] that the resources of businesses and the third sector were not time-limited in the same way as Governments, enabling greater consistency in their work;[148] that other sectors have a range of expertise about how to influence behaviour which the Government could take advantage of;[149] and that the third sector were particularly good at harnessing community spirit and were trusted messengers for behaviour change interventions.[150] Rory Sutherland, President of Independent Practitioners in Advertising, noted that, in the business world, some brands also engendered trust in a way that governments often do not[151]—a point borne out by the contribution of businesses during the Change4Life (see Box 8, page 37) programme in communicating messages to consumers.[152]

BOX 8

Change4Life

The Change4Life campaign involved over 200 partners drawn from the voluntary sector, businesses and local government. The campaign also involved over 50,000 local community groups.[153] The *Change4Life One Year On* report noted that a number of health charities, including Cancer Research UK, Diabetes UK and the British Heart Foundation ran their own campaigns in support of Change4Life. Businesses also supported the movement, for example by providing free gym access, discounted fruit and vegetables and low-cost bikes.[154] A number of witnesses agreed that the campaign had used partnership working effectively.[155] Tim Duffy, Chief Executive of M&C Saatchi, noted that the Change4Life campaign minimised conflict and Paul Kelly, Head of Corporate Affairs at Asda, said that the campaign worked because there was clarity around the role and responsibilities of all of the partners.[156]

5.18. Witnesses from businesses and the third sector observed, however, that partnerships worked most effectively where there was little or no conflict of interests or "internal conflict".[157] Tony Hawkhead, Chief Executive of Groundwork, agreed, suggesting that the Green Deal was a good example of effective partnership working because everybody involved got something out of it (see Box 9, page 37).[158] By contrast, voluntary agreements, which are established between the Government and businesses to change the way in which businesses operate without regulation, were cited as a particularly controversial form of partnership working because of potential conflicts of interest.

BOX 9

The Green Deal

The proposed Green Deal allows businesses to offer energy efficiency improvements to homes, community spaces and businesses at no upfront cost, and recoup payments through a charge in instalments on the energy bill. Mr Hawkhead argued that the Green Deal provides an example of a partnership where there is a clear role for Government, businesses and the third sector and no conflict of interest:

"The role for the Government ... is quite clearly setting a framework and creating a clear vision for how the Green Deal will work: negotiating with private financiers, setting out the legislation. Business's role ... will be quite clearly to install the home insulation … and probably to lead on some of the behaviour change work because they will be in there ... Where the third sector can come in there is the whole area around fuel poverty. The Green Deal will not work for fuel poverty, we will need to use the levy on our fuel bills to try and deal with that … That is where the trusting relationship that the third sector has uniquely in poorer communities can make the difference …"[159]

Voluntary agreements between Government and businesses

Effectiveness

5.19. Some witnesses from both the business sector and the Government favoured voluntary agreements. Officials from DH cited a report from the Organisation for Economic Co-operation and Development (OECD) which concluded that cooperation between governments and the food industry would be crucial if the problem of obesity were to be tackled successfully.[160] Mr Letwin argued that the Government should try to get businesses to work with them because "one of the very few pieces of extremely strong evidence … is that you can easily create regulations that people will observe in the letter but not in the spirit".[161] Voluntary agreements were not, he said, a means of "handing [businesses] the power". A number of witnesses also referred to work on salt reduction as an example of an effective voluntary agreement.[162] (We note, however, that the salt reduction campaign also publicly named and shamed products particularly high in salt and so its effectiveness cannot be attributed only to the voluntary agreement.)

Burden on businesses

5.20. The Government also argued that voluntary agreements would be less burdensome on businesses than legislation. The evidence we received from businesses themselves was mixed on this point. Paul Kelly, Head of Corporate Affairs for Asda, agreed that Asda had had only positive experiences of voluntary agreements.[163] In contrast, Justin King, Chief Executive of Sainsbury's, said that voluntary agreements could be burdensome on businesses,[164] and that, furthermore, Sainsbury's were "not against legislation" and would in some instances "positively encourage it" if it was easy for businesses to work with.[165] Mr King emphasised that voluntary agreements tended to be short-term, making them more difficult for businesses to engage with properly, and that although legislation could be burdensome, it was more "consistent for everybody" and tended "to stand more the test of time than a voluntary agreement".[166] Dr Susan Jebb, Chair of the cross-Government expert advisory group on obesity, agreed that voluntary agreements could "be much more onerous" and said that it was an issue that the food network of the responsibility deal was thinking about.[167]

Conflict of interests

5.21. Many witnesses expressed scepticism about the effectiveness of voluntary agreements because of the overriding commercial interests of businesses.

---

160 Q 355.

161 Q 738.

162 BC 16, BC 58, BC 108, QQ 355, 560. The Food Standards Agency noted that "the dietary evidence suggests that population salt intakes have seen, on average, a 0.9g reduction from 2001 to 2008" (BC 16). An extra 15% reduction in salt has been promised by manufacturers through the Responsibility Deal Network. Not all witnesses were positive about the voluntary agreement on salt however. Dr Atherton noted that the change in salt consumption achieved so far was "fairly marginal" (Q 455).

163 QQ 544–5.

164 Q 466.

165 Q 456.

166 Q 467. Mr King cited the example of a voluntary agreement on reducing the use of plastic bags to demonstrate this point.

167 Q 562.

Mr King, for example, said that they were the "refuge of scoundrels", tending to appeal to the lowest common denominator,[168] and were often overtaken by political events.[169] Others went further, suggesting that businesses would never be motivated to do anything which impacts their success. Professor Vivienne Nathanson, Head of Science and Ethics at the British Medical Association, for example, told us about her experience of the alcohol network of the Public Health Responsibility Deal (see Box 10, page 39):

> "... the industry, which is at least two thirds of the ... group, is not motivated so far to really look for things that hurt them. They are looking at completely protecting their bottom line which I can understand—they are businesses—but from the health side we want to hurt their bottom line."[170]

Professor Nathanson said that the health organisations on the responsibility deal "believe that, inherently, voluntary agreements won't work and particularly in the alcohol sector. They may have more chance in the food sector—'may' being an important caveat there".[171]

BOX 10

The Public Health Responsibility Deal

The Public Health Responsibility Deal is an example of the Government pursuing voluntary agreements with businesses and other organisations to help achieve policy goals. The Deal was launched by DH to "[tap] into the potential for businesses and other organisations to improve public health and tackle health inequalities through their influence over food, alcohol, physical activity and health in the workplace".[172] It is overseen by a plenary group chaired by the Secretary of State for Health and includes five networks. Four work within a particular area of public health—food, alcohol, physical activity, health at work—and involve representatives of the Government, businesses and health non-governmental organisations (NGOs), who work together to establish "pledges for action".

There is also a fifth network on behaviour change, which

"... seeks to put behavioural science expertise at the disposal of the other networks, enabling them to push the boundaries of their work. The network is also exploring ways in which Responsibility Deal partners can help build the evidence-base for more ground-breaking future work to change behaviour in environments including the retail sector."[173]

Pledges under the deal were published on 15 March 2011 and six health organisations[174] did not sign up. They expressed particular concern with the alcohol network pledges, arguing that they: were too limited with little or no evidence of effectiveness; prioritised industry views; were not specific or measurable and did not indicate what would be a success. They also noted that

there had been no commitment made on alternative actions if the pledges did not reduce levels of alcohol-related harm.[175]

5.22. Other witnesses echoed Professor Nathanson's view. Richard Wright, Director of Sensation, Perception and Behaviour at Unilever, told us that "the reality ... is that any business is in business to make money"[176] and that opportunities to influence behaviour will be taken if they are a means to selling more products.[177] Mr King said that decisions taken by Sainsbury's that might discourage consumption of unhealthy products, for example removing confectionery from their checkouts in some stores, were taken when they were what the customer wanted rather than on the basis of any judgement about improving the health of consumers.[178] Mr Letwin indicated a similar view when he said that working with businesses through voluntary agreements involved thinking about whether the agreement was "possibly in their commercial interest".[179]

Evaluation, timelines and regulation

5.23. A number of witnesses were concerned that mechanisms should be in place to ensure that voluntary agreements were subject to rigorous evaluation, with clear outcome measures and timelines. Dr Jebb said that "it is ... vital that public health bodies and institutions are charged with monitoring and evaluating the success or otherwise of ... delivery".[180] Professor Lindsay Davies, President of the Faculty of Public Health, said that voluntary agreements were an "experiment" and so should not be allowed to "drift on and on and on as a substitute for ... taking harder action, because the obesity epidemic can't wait",[181] a point also made by Professor Nathanson.[182] Other witnesses emphasised the importance of timelines, arguing that if agreements could not be reached or were not effective, then the Government had to be prepared to regulate. Professor Nathanson said, for example, that the Government should be prepared to say "if we don't get a sufficiently challenging-to-the-industry ... agreement, then we would be prepared to regulate on the areas that the voluntary agreement should cover, as well as the areas that will only happen through regulation".[183] Mr Letwin acknowledged this point when he said "we may need to regulate [businesses] and not merely do deals with them".[184]

5.24. Anne Milton MP, Parliamentary Under Secretary of State for Public Health, provided some reassurance in relation to these concerns:

> "... when we publish our response ... and set the outcomes down fairly clearly, we will need to give an indication as to when we would step in. That is quite important, setting clear outcomes, and some timeframes

that we can be judged on as a Government. Also, it is an indication to industry as to where we will step in, if they do not help us get along to that point."[185]

As we note in Box 10 (page 39), some organisations do not feel that these measures were present in the published Public Health Responsibility Deal. The pledge about reducing obesity made by the food network of the Deal does not set outcomes relating to changes in behaviour and does not reflect the available evidence about how to tackle the problem of obesity (see paragraph 7.20 below).

5.25. **The involvement of other organisations to support the Government's behaviour change initiatives may provide valuable opportunities to improve the effectiveness of behaviour change interventions, in particular by allowing a range of messengers to be used to deliver them. We welcome the Government's intention to use such collaborations.**

5.26. **However, we have major doubts about the effectiveness of voluntary agreements with commercial organisations, in particular where there are potential conflicts of interest. Where voluntary agreements are made, we recommend that the following principles should be applied in order to ensure that they achieve their purpose:**

- **The Government should specify clearly what they want businesses to do based on the evidence about how to change behaviour, and what steps they will take to achieve the same result if voluntary agreements are not forthcoming, or prove ineffective.**
- **Voluntary agreements should be rigorously and independently evaluated against measurable and time-limited outcomes.**

5.27. **Given that these principles do not appear to have been applied consistently to the Public Health Responsibility Deal Network, we urge DH, in particular, to ensure that these principles are followed when negotiating further voluntary agreements. In relation to the current agreements, we recommend that DH should state for each pledge what outcomes are expected and when, and provide details of what steps they will take if the agreements are not effective at the end of the stated period.**

The role of local authorities

5.28. Mr Letwin told us that the Government "are very determined to ... decentralise power and to leave local communities and local governments as free as possible to make their own decisions about how they do things".[186] In our two case study policy areas, the role of local authorities in delivering behaviour change interventions has been emphasised in recently published white papers.[187]

---

185 Q 710.

186 Q 739.

187 *Creating growth, cutting carbon* op. cit; *Healthy lives, healthy people* op. cit.

Benefits of decentralisation

5.29. Witnesses described two major benefits of a local approach to changing behaviour. First, different local areas have different local needs and so interventions should reflect these differences.[188] In relation to sustainable transport, much of our evidence agreed that local authorities were best placed to design behaviour change interventions because they were most qualified to assess the need for, and implement, interventions.[189] Similarly, witnesses were mostly positive about the proposed reforms to public health which would move Directors of Public Health into local authorities, suggesting that they would provide opportunities to coordinate behaviour change activity across a range of areas.[190] Professor Dame Sally Davies noted that this shift should mean that local authorities will start to "look at all the things they do—education, planning, cycling paths, transport … through a health lens as well as through the cost lens and the service lens".[191] Dr Frank Atherton, Chairman of the Association of Public Health Directors, told us that "Directors of Public Health [were] ... universally welcoming the move into local authorities, because that's where the levers of change actually exist".[192]

5.30. Secondly, some witnesses suggested that the devolution to local authorities of responsibility for designing and implementing interventions would provide an opportunity to help build the evidence-base for the effectiveness of population level interventions.[193] Mr Letwin said that, in principle, the decentralisation of power should provide a "rich field" for evidence generation—although he acknowledged that it would be important to ensure that mechanisms were in place to take advantage of it.[194]

Possible problems

5.31. Some witnesses expressed doubts about decentralisation however. They questioned whether there were the requisite levels of skill in designing and evaluating interventions at a local level, or adequate mechanisms in place for the dissemination of knowledge, to allow the Government to make the best use of what is learnt about the effectiveness of interventions. In relation to the use of evidence, Paul Sacher, Chief Research and Development Office for MEND Central, and Zoe Hellman, Company Dietician for Weight Watchers, said that commissioners of weight management programmes within Primary Care Trusts did not review evidence accurately and appeared not to understand the most important measures of effectiveness.[195] A similar view was reflected in the evidence we received in relation to our case study on reducing car use to limit carbon emissions (see paragraphs 7.42–43 below). In addition, witnesses suggested that local authorities may not have

---

189 BC 116, BC 121, BC 127, BC 136, BC 141.

190 QQ 449, 573. It was also noted however that these reforms did carry risks. Professor Nathanson, for example, suggested that "the risk in the short term is of fragmentation and ... the ... loss of a really expert resource" (Q 573).

191 Q 377.

192 Q 449.

193 Q 630.

194 Q 739. Dr Atherton made a similar point about building the evidence-base at a local level for health interventions (Q 452).

195 Q 442.

the range of skills and resources necessary to interpret the available evidence.[196]

5.32. Witnesses also expressed concern that devolving responsibility for behaviour change interventions in some policy areas might have a detrimental effect on evaluation.[197] The National Obesity Observatory noted, for example, in relation to the commissioning of weight loss interventions, that:

> "Although quantitative data are lacking, indications are that very few interventions are evaluated to an adequate degree. Problems include: lack of skilled staff; confusion over appropriate evaluation methods; lack of validated measurement tools; insufficient emphasis in the commissioning process; insufficient budgets being allocated to the evaluation component of a programme ..."[198]

5.33. The Government acknowledged the importance of effective evaluation of local initiatives. Mr Letwin told us that the Government had discussed setting up some research apparatus at low cost to "investigate what had been done by one local government in one place, and enable it to be evaluated and transmitted to other local governments in other places".[199] Mr Dowie said the DfT recognised that it had "a responsibility through the ... sustainable transport fund to ensure there is a proper evaluation framework in place".[200] To that end, the department has "published impact evaluation guidance aimed at scheme promoters and evaluation practitioners to help them choose an evaluation approach which is best suited to their evidence needs and helps them design an evaluation which enables the observed impacts to be attributed to the scheme". They have also developed a framework "for evaluating schemes aimed at encouraging sustainable and active travel behaviours".[201]

5.34. In relation to sharing knowledge at a local level, witnesses who had designed and commissioned local interventions told us that there was no mechanism for the broader dissemination of the lessons learnt from their behaviour change programmes.[202] Robin Gargrave from Central YMCA said that while there was some informal knowledge exchange among local organisations, there were no "national data that shows the direction of travel, and also indicates what's working, what's not working and why". He added: "anything that the Government can do to help facilitate that would be most welcome".[203] The DfT stated in its Sustainable Transport white paper however that it would be "stepping back from monitoring" and that "the Local Government Association and local authorities themselves will be responsible for spreading best practice, sharing what works and developing a framework that improves capability across the local transport spectrum".[204]

5.35. Finally, a number of witnesses cautioned that localism should not detract from the important role central government still had to play. Lynn Sloman, Director

of Transport for Quality of Life, said for example that the DfT should continue to foster experimentation and that it should "provide a consistent, long-term direction of travel so that the local authorities and everybody else knows where they are".[205] This was supported by other witnesses in relation to public health.[206]

5.36. **Although decentralising responsibility may provide a useful opportunity to tailor local behaviour change initiatives and to help build the evidence-base for applied behaviour change research at the population level, steps should be taken to ensure that interventions are evidence-based and properly evaluated. To this end, we recommend that the Government:**

- **produce guidance for local authorities on how to use evidence effectively to design, commission and evaluate interventions and on the need to involve experts in the design and evaluation process (see paragraphs 4.25 and 6.3), and provide advice on how to best use the tendering process to ensure value for money;**
- **take steps to ensure that evaluation of interventions, including data collection and reporting of behaviour change outcomes, across local areas is of sufficiently high quality to allow comparisons and analysis;**
- **take steps to ensure that what is learnt by a local government in one place can be readily transmitted to other local governments; and**
- **provide funding only for those schemes which are based on sound evidence. Demonstration of rigorous evaluation and contribution to the evidence-base should be a requirement for future funding for behaviour change interventions.**

[205] Q 631.

[206] QQ 446–7, 573.

CHAPTER 6: EVALUATION OF BEHAVIOUR CHANGE INTERVENTIONS

6.1. A common concern raised by witnesses was the need for greater consistency in the quality of evaluation of government behaviour change interventions, with many suggesting that this was a significant area of weakness.[207] Rigorous evaluation is necessary not only in order to establish whether policies are working, whether they can be improved and whether they represent value for money, but—in the context of behaviour change interventions—also whether they contribute to the development of a much needed evidence-base for the effectiveness of interventions at a population level (see paragraph 3.1 above).

Ensuring effective evaluation

6.2. Witnesses identified the following factors as necessary for effective evaluation:

- building evaluation into a policy design from the outset;
- good outcome measures;
- longitudinal data;
- the use of controls wherever possible;
- sufficient funding for evaluation;
- data on cost-effectiveness.

Building evaluation into policy design

6.3. Several witnesses called for evaluation to be built into policy design from the outset,[208] not least because, as Professor David Gunnell, Professor of Epidemiology at the University of Bristol, observed, it was often the case that "once the policy has been formulated and begun to be rolled out, it is too late to build in an effective evaluation".[209] It is unfortunate, therefore, that, according to Professor Ray Pawson, Professor of Social Research Methodology at the University of Leeds, many evaluations are put out to tender and organised in a way that "excludes the evaluation team from the programme design stage", meaning that they have no influence on fine-tuning an intervention, are unclear about whether results will demonstrate success or failure and often discover that the intervention is "half-baked".[210] Others also highlighted the need to bring in academics at the start of the policy development process to help ensure that evaluations are appropriately designed.[211]

6.4. The Treasury guidance on appraisal and evaluation (the Green Book) works on the basis of the ROAMEF (rational, objectives, appraisal, monitoring, evaluation and feedback) policy making cycle and so appears to provide for

[209] Q 188.

[210] BC 148.

[211] BC 103.

evaluation after implementation.[212] We were encouraged to hear however from Siobhan Campbell, Head of Policy at DECC, that evaluation should not be considered only as the "E" in the ROAMEF but rather that "at the rationale, objective, appraisal stage, there is an expectation that you are using evaluation evidence to inform these decisions that you are making along the way",[213] and Dr McCloy, ESRC Research Fellow in GES, said that one of the key aims of her work with the behaviour change network was to get policy makers to build evaluation into the policy design process at an early stage.[214]

Long-term evaluation and outcome measures

6.5. Several witnesses identified the absence of longitudinal evaluation (that is, evaluation over a prolonged period) as a significant problem.[215] Dr Ian Campbell, Medical Director of Weight Concern, for example, suggested that attitudes in the public sector tended to be short term and that funding was not available to measure outcomes over the longer term.[216] Anne Milton MP, Parliamentary-Under Secretary of State for Public Health, appeared to confirm this observation when she suggested that measures which would show, for example, a reduction in alcohol-related liver disease would take a long time and that that could lead to the accusation that the department was doing something which "maybe will favour our successors in Government".[217] Phillip Darnton, Chair of Cycling England, and Professor Pawson said that another problem was that those conducting evaluations were sometimes asked to report prematurely.[218] John Dowie, Director of Regional and Local Transport at the DfT, agreed that this had been the case with the Sustainable Travel Towns programme (see Box 11, page 46).

BOX 11

Sustainable travel towns pilot

Professor Peter Bonsall, Professor of Transport Planning, University of Leeds, criticised the evaluation of the Sustainable Travel Towns pilots on the ground that "rather too many of these initiatives have been evaluated predominantly by self-reported behaviour, which is ... a recipe for disaster" and that a number were "evaluated by the same team who did the work".[219] Mr Dowie further noted that "because of the drive to get evaluation evidence out" the evaluation would not establish the longitudinal effects of the intervention,[220] meaning that any conclusions about the long-term effectiveness of the intervention and its cost-effectiveness could not be established. We note however that this was a pilot and used randomisation and control techniques effectively, therefore meeting some of the criteria for effective evaluation.

218 BC 148, Q 648.

219 Q 607.

220 Q 662.

6.6. It was suggested to us that a further weakness of the Government's current approach to evaluation is how outcome measures are framed.[221] Outcome measures should be specific, objective and consistent across trials. Appropriate outcome measures enable the success of policies to be monitored throughout their implementation and therefore allow an assessment of their effectiveness in the shorter term, even if the evaluation is intended to continue through to the long term. Several witnesses expressed concern about inappropriate use of outcome measures for behaviour change interventions. In particular, it was noted that attitudes and self-reported behaviours were often used as measures of a behaviour change intervention.[222] The Government acknowledged that sometimes "evaluation has been distorted by being focused on customer attitudes and programme outputs, rather than outcomes".[223] The Targeting Benefit Thieves Campaign provides an example of this confusion (see Box 12, page 47).

BOX 12

The Targeting Benefit Thieves campaign

The Targeting Benefit Thieves campaign began in 2002 and was designed to reduce fraud and error in the benefit system. The Government noted that "the campaign tracked people's attitudes and self-reported behaviour as a result of seeing the campaign. Tracking research indicated that the proportion of claimants who consider it 'very easy' and 'fairly easy' to get away with benefit fraud declined from 41% (Oct 2006) to 29% (March 2010). The proportion of claimants agreeing with the statement, 'the chances of getting caught abusing the benefits system are slim' has declined, falling from 39% (Oct 2006) to 21% (March 2010)".[224] No information was provided about evaluation of the primary interventions outcomes of reducing fraud and error in the benefit system.

6.7. We were particularly concerned by confusion between outcomes and outputs within DH. For example, in relation to the Great Swapathon, we were told that the outcome of the intervention was "to create a million swaps"—although, shortly afterwards, we were told that the outcome measure was, in fact, a decreased health burden in the long term.[225] Measuring the Great Swapathon according to the number of swaps exemplifies a point made by NICE that "evaluations of behaviour change interventions frequently fail to make a satisfactory link to health outcomes".[226]

Using sufficient controls and evaluating complex interventions

6.8. Some evaluations, including the Sure Start and the Health Trainers evaluations (see Boxes 13, page 48 and 15, page 49), have been criticised for not including any, or sufficient, controls. According to Dr Steven Skippon, Principal Scientist, Shell Global Solutions, insufficient controls and poor methodology would increase the chance "that confounding variables will confound the answer".[227]

[223] BC 114.

[224] *Ibid*.

[225] QQ 356–8.

[226] BC 52.

[227] Q 593.

Choosing a method of evaluation is not straightforward. Several witnesses thought that randomised control trials (RCTs) were the "gold standard ... of evaluation".[228] Professor Pawson, on the other hand, challenged this view, arguing that, in some cases, demonstrating the effectiveness of a policy would sometimes require a "comprehensive" or a "multi-method evaluation"[229] rather than a simple "policy on, policy off" comparison.[230] Professor Pawson's argument was supported by other witnesses and we note that Defra's evaluation of their food waste policy uses a range of methods (see Box 14, page 48).

BOX 13

Sure Start

The evaluation of the Sure Start programme was criticised by Professor Gunnell because it could have been rolled out in a way that would have allowed "more robust, randomised evaluation ... it could have been done with better collaboration between researchers and policy makers".[231] Dr Halpern also said that Sure Start arguably did not build in sufficient controls.[232]

6.9. Where RCTs are not possible, some witnesses suggested a natural experiment design (where the evaluation is not by way of a randomised experiment but controlled using existing variation);[233] others suggested a "stepped-wedge" approach (where a policy intervention is rolled out to participants at different times). Small-scale pilots and demonstration projects could also ensure that controls were established—indeed, Professor Britton thought piloting was "crucial".[234] Pilot groups were used effectively for establishing and improving smoking cessation interventions (see Box 1, page 20) and the Sustainable Travel Towns programme made good use of demonstration projects (though in other areas its evaluation could have been improved) (see Box 11, page 46). Professor Kelly noted however that the pilots themselves need to be evaluated properly,[235] and Dr Chatterton cautioned that sometimes pilots would not show the extent of the effects of an intervention at a population level.[236]

BOX 14

Food Waste

Defra's food waste reduction programme, delivered in collaboration with Waste Resources and Action Programme (WRAP), was evaluated using a range of methods, both qualitative and quantitative. Self-reported behaviour, including assessments of awareness and understanding of the campaign, understandings of how to reduce food waste and commitment to reducing food waste. This was accompanied by data about the quantities of food in the waste stream and information from the retail environment about purchasing habits.[237]

237 Q 284.

6.10. We have already concluded, on the basis of the evidence we have received, that using a range of interventions will often be more effective in changing behaviour at a population level than using a single intervention in isolation (see paragraph 5.13 above). But multi-faceted interventions can make evaluation more difficult because of the difficulty in discerning the relative effectiveness of the components of such interventions. Professor Bonsall, for example, said: "it is impossible ever to untangle the particular effects of different components. One can only talk about the packages and draw inferences from the effect of different packages".[238] Professor Britton argued that, while it would be practically possible, disaggregation would take too long. But this, he suggested, should not deter policy makers because, in his view, where there was a sufficient evidence to support trying an intervention, then it should be tried without prevarication.[239] Mr Letwin took a similarly practical approach: what mattered most for government was to be able to judge whether what they had done was working—"it is less important, immediately and practically, to know which bit of it is working".[240]

6.11. Dr Harper, Chief Social Scientist at Defra, however, appeared to be more cautious: there was, she said, more to be done across government "in establishing what works and what's worth investing in, in terms of specific components of packages".[241] She suggested that one approach would be to use more pilots.[242] Mr Baker agreed: "it is possible, even within a complex matrix of interventions, to work out which ones are having particular effects"[243] and Professor Michie drew our attention to the Medical Research Council (MRC) guidance on evaluating complex interventions.[244]

Funding

6.12. Rigorous evaluation, especially using long term objective outcome measures and population-representative samples, cannot be undertaken without adequate funding provision. The Health Trainers programme (see Box 15, page 49) provides an example where the absence of funding impacted adversely on evaluation.

BOX 15

Health Trainers

The Health Trainers programme was cited as a policy based on good evidence (see paragraphs 7.22–23 below) but several witnesses told us that the evaluation could have been better. The BPS health psychology team advised DH that the programme should be rolled out in stages in a 'stepped wedge' design but this was not possible because of insufficient funding.[245] As a result, the programme was evaluated by comparing data before and after the programme. Judy White from the Yorkshire and Humber Health Trainer Team told us that that the quality of the data collected was variable, making it difficult to conduct thorough analysis.[246] Ms White was

unable to provide any comprehensive data on the basis of the evaluation of the Health Trainers programme, particularly in relation to cost-effectiveness.[247] This was in stark contrast to Weight Watchers and MEND, which provided figures for the effectiveness and cost-effectiveness of their interventions (see Box 16).[248]

Cost-effectiveness

6.13. Publicly funded behaviour change interventions should provide value for money. That is self-evident. It was disappointing to find therefore that although private sector companies—such as the Weight Watchers and MEND programmes (see Box 16, page 50)—were able to provide detailed evaluation data (though we did not assess the methodology by which these data were established),[249] we had difficulty in sourcing such data for the Health Trainers programme.

BOX 16

MEND and Weight Watchers

MEND

Paul Sacher, Chief Research and Development Office for MEND Central, said that, since the first MEND programme was delivered in 2002, the programme has undergone "feasibility, pilot, efficacy and effectiveness studies to fully evaluate the outcomes". The programme has been evaluated against a range of outcome measures, including "reductions in body mass index, reductions in waist circumference … improvements in things like cardiovascular fitness, physical activity and sedentary activity levels and again some of the psychosocial measures, so things like self-esteem and body image". Mr Sacher told us that an independent study demonstrated that "the incremental, cost effectiveness ratio of the programme is £1,671 per QALY[250] gained".[251]

Weight Watchers

Zoe Hellman, Company Dietician for Weight Watchers, said that an independent report demonstrated that the cost-effectiveness of the Weight Watchers programme was £1000 per QALY. The results of a recent RCT "compared having access to Weight Watchers versus standard care within primary care" across the UK, Australia and Germany. The study demonstrated that after a year "people who had access to Weight Watchers lost significantly more weight ... and the retention rates were higher".[252]

Conclusions

6.14. **Effective evaluation requires that:**

- **evaluation should be considered at the beginning of the policy design process. External evaluation expertise should be sought, where necessary, from the policy's inception;**

---

247 *Assessing the Value for Money of Health Trainer Services*, Lister (2010).

248 Q 432.

249 Though we note that QALY figures can only be used to demonstrate orders of magnitude and do not provide specific data and we have not investigated how these figures were formulated

250 Quality adjusted life year.

251 Q 432.

252 *Ibid*.

- **relevant outcome measures—as distinct from outputs—should be established at the beginning of the policy development process;**
- **the duration of the evaluation process should be sufficiently long-term to demonstrate that an intervention has resulted in maintained behaviour change;**
- **pilot studies, using population-representative samples, followed by controlled trials assessing objective outcomes should be used whenever practicable; and**
- **sufficient funds should be allocated for evaluation, recognising that establishing what works, and why, is likely to result in better value for money in the long-term.**

6.15. **We find however that, at present, evaluations of government behaviour change interventions often lack one or more of these necessary elements. While we welcome the Government's revision of the Magenta Book, the evaluation guidance for policy makers and analysts, we believe that it could be further improved. We recommend that the Government consult external evaluation experts on the creation of a concise document for policy makers, containing only the most important principles of evaluation. We further recommend that they make clear what steps they will take to ensure that the revised guidance leads to a change in evaluation culture across Whitehall.**

CHAPTER 7: CASE STUDIES

7.1. To assist us in our inquiry, we undertook two case studies. The first looked at government behaviour change interventions to reduce the prevalence of obesity and the second at interventions to reduce car use to limit CO_2 emissions. These policy areas were chosen because they both involve major challenges which require significant changes in behaviour. They differ in that the first policy area is principally concerned with benefiting the individual (though reducing burdens on the health service must also be a concern), the second involves preventing harm to society at large, now and in the future. Where findings from the case studies have been used in the preceding Chapters to inform our more general findings or recommendations, this has been noted in the text. In addition, we have made some more specific recommendations in relation to each case study.

Case Study 1: Tackling obesity

7.2. In 2009, almost a quarter of adults in England were classified as obese and three in 10 children aged between two and 15 were classified as either obese or overweight.[253] Obesity is a major public health problem. It is associated with a number of chronic diseases such as type 2 diabetes and high blood pressure, both major risk factors for cardiovascular disease.[254] A Foresight report ("the Foresight report") on tackling obesity, published in 2007, estimated that, without action, obesity-related diseases would cost society £49.9 billion per year by 2050.[255]

What do we know about how to influence behaviour to reduce obesity?

7.3. The Foresight report concluded that:

- The causes of obesity are complex, encompassing biology and behaviour, but set within a cultural, environmental and social framework.
- For an increasing number of people obesity is an inevitable—and largely involuntary—consequence of exposure to a modern lifestyle, which has included major changes to work patterns, transport, food production and food sales.
- Successfully tackling obesity is a long-term, large-scale commitment.
- The obesity epidemic cannot be prevented by individual action alone and requires a societal approach.
- Preventing obesity is a societal challenge, similar to climate change. It requires partnership between government, science, business and civil society.[256]

7.4. Witnesses who gave evidence to us agreed that the behaviours which lead to obesity are a consequence of a number of interacting influences working at various levels (the individual, family and organisation) and involving social

---

254 *Ibid*.

255 *Tackling obesity: future choices*, Foresight and BIS (2007).

256 *Ibid*.

and environmental factors.[257] As in the Foresight report, some suggested that the environmental determinants of behaviour were particularly important and that, arguably, the current societal environment was one in which unhealthy choices were easier than healthy choices (sometimes described as the "obesogenic environment").[258] Professor Baldwin said, for example, that:

> "... the explanation for [the rise in obesity] is plainly not to be found in a collapse of personal responsibility over this period. Instead the explanation revolves around a toxic combination of readily available cheap high energy food and drink, fewer opportunities for manual labour, an increase in car ownership, changing social norms concerning cooking and eating, and other features of the 'obesogenic' environment ..."[259]

Because behaviour is influenced at many levels, several witnesses commented that a range of interventions would need to be applied simultaneously to be effective.[260]

7.5. The link between health inequalities and obesity was also highlighted by some witnesses,[261] a connection well-documented in the recent Marmot review.[262] Professor Michie argued that this suggested that interventions should be targeted at particular groups: "NICE's review of behaviour change ... has demonstrated, and been supported by lots of evidence since, that interventions that are tailored towards the targeted population tend to be more effective than those that aren't".[263] We note the commitment by DH to take steps to reduce health inequalities, particularly through early intervention and prevention, and look forward to seeing how this will be translated in their forthcoming obesity strategy.

Gaps in the evidence-base

7.6. According to the Association for the Study of Obesity and NICE, the evidence relating to effective behaviour change interventions and obesity at the level of the individual and small groups was clear (and reflected in NICE guidance).[264] But, as with other policy areas, there are significant gaps in the applied research base at the population level. Dr Melvyn Hillsdon, University of Exeter, for example, said:

> "All the theory tells us that there must be some combination of personal, normative and environmental intervention to change population prevalence ... the big question is about population prevalence change, not so much about individually delivered interventions."[265]

Are Government obesity policies evidence-based?

7.7. Bearing in mind what is known about behaviour change interventions and reducing obesity, we have considered the extent to which the Government's

[265] Q 334.

obesity policies are evidence-based. We are aware that our assessment is in advance of the publication of the Government's obesity strategy, which is due shortly.

The "obesogenic environment"

7.8. Several witnesses acknowledged that, following the Foresight report, DH had made efforts to pursue an evidence-based approach to obesity,[266] but they were critical of DH on the ground that insufficient attention was being paid to tackling the wider environment in which decisions are made.[267] Dr Campbell, for example, commented that "confronting the real commercial and environmental stimuli of obesity has not yet been achieved".[268] The current Government have stated that, though they want to assist individuals in taking responsibility for their own health, their obesity strategy will involve changes to the wider environment to make it easier for people to adopt a healthier diet and increase their physical activity.[269]

Change4Life

7.9. Change4Life began in January 2009 and is currently described as the marketing component of the Government's response to the rise in obesity.[270] According to DH, the campaign aims to inspire a societal movement in which everyone who has an interest in preventing obesity, including government, business, healthcare professionals, charities, schools, families or individuals, can play their part (see Box 8, page 37).

7.10. Several witnesses commented positively about the extent to which the Change4Life programme was evidence-based.[271] The Sustainable Development Commission, for example, said that the programme made good use of messengers and provided a good example of how to integrate behavioural sciences into the design of an intervention.[272] Tim Duffy of M&C Saatchi referred to the precise segmentation work undertaken by DH in order to target interventions more accurately. DH itself described to us how piloting was used: the Change4Life convenience stores project was piloted in the North East, after which, given the results of the pilot, the intervention it was rolled out more widely.[273]

7.11. The Change4Life campaign—in particular the Great Swapathon initiative—has, however, not been without criticism. The Great Swapathon provided vouchers to families for discounted food products and activities. But far from encouraging healthy eating, some evidence suggested that providing discounted healthy products actually encouraged people to buy more unhealthy ones.[274] Furthermore, although Sian Jarvis, Director General of Communications at DH, said that there had been some analysis of the extent

to which the Change4Life programme has influenced purchasing behaviour (and that the results were positive)[275], much of the evaluation so far has taken the form of an assessment of brand recognition and claimed change[276]—a worrying example of the lack of outcome measures associated with a behaviour change intervention which we describe in paragraph 6.7 above.

7.12. **It appears that the Change4Life programme has, on the whole, been evidence-based and appropriately targeted. We note the Government's commitment to continue using the brand and urge DH to ensure that future evaluations are robust and establish whether or not the programme is likely to be successful in the longer term.**

Population wide interventions: advertising, marketing and food labelling

7.13. Restrictions on advertising during children's programmes of products high in fat, salt and sugar were introduced by Ofcom in 2007. In June 2010, a NICE report (on preventing cardiovascular disease) recommended that these regulations should be extended on the ground that programmes for older audiences also had a powerful influence on young people.[277] Several witnesses commented on the impact of food marketing and advertising on food purchasing and eating behaviour, particularly on children,[278] noting that tackling food advertising was particularly cost effective because of its low cost and broad reach. Evidence about the impact of wider marketing activities, such as in-store marketing and product promotions, appears to be limited, though Professor Marteau suggested that there is a growing body of evidence that product packaging has an impact on food choice. Furthermore, there is evidence to suggest that television advertising can have a long-term impact on eating behaviour beyond consumption of the product being advertised. [279] In January 2010, DH commissioned an independent review of the regulatory and non-regulatory framework for marketing and promotion of food and drink to children. We await its findings, expected to be published shortly, with interest.[280]

7.14. In relation to food labelling, Anne Milton MP, Parliamentary Under Secretary of State at the DH, said that there was "a huge amount of conflicting evidence".[281] We do not think this is a fair summary. Although some witnesses argued that the impact of food labelling on purchasing and eating behaviour had yet to be established[282], all witnesses who were asked, with the exception of those from DH, agreed that the evidence demonstrated that those labels which included traffic light colours were better understood by consumers than those without.[283] Professor Marteau said, for example: "the evidence shows that people certainly understand ... more clearly ... the nutritional content of the food when traffic light labels are used, compared to a more numerical system" (although, she went on, "what we don't know very

well is the impact of that knowledge on ... purchasing and ... consumption".)[284] A 2009 study by the Food Standards Agency concluded that the labels which achieved the highest levels of comprehension among consumers were: first, a label combining text (the words high, medium and low) and traffic light colours (71%) and, second, a label combining text, traffic light colours and percentage of guideline daily amount (GDA) (70%).[285] According to NICE, front of packaging traffic light labelling helped consumers make more informed choices about food consumption and, as a result, they recommended strongly the introduction of a single, integrated traffic light colour-coded system of food labelling as the national standard.[286]

7.15. Some witnesses asserted that there was not only a connection between traffic light labelling and comprehension, but also between traffic light labelling and behaviour. Asda and Sainsbury's both said they used this labelling on their own-brand products and both provided evidence that the introduction of traffic light labelling led to a decrease in sales of those products with red on the label.[287] Mr King told us, for example, that:

> "... on the introduction of Multiple Traffic Light labelling, against a comparable 12 week period during which fresh ready meal sales grew 26.2%, sales of Be Good To Yourself Easy Steam Salmon and Tarragon (mostly green traffic lights) grew 46.1%, whereas sales of our Taste the Difference Moussaka (mostly reds) decreased by 24%".[288]

7.16. Despite this evidence, the Government have decided to pursue a system of labelling based on percentage GDA. Ms Milton justified this decision on the basis that they were trying to achieve a system that was "consistent" and "meaningful", and "relevant to all the groups" that they were "trying to target".[289] Officials from DH gave a similar account. They said that the decision was based on evidence that a consistent approach was most likely to be effective, and that they did "not believe that traffic lights would have been consistently adopted by the food industry".[290] This suggests to us that the Government's policy on food labelling was determined not by the evidence but by what could be achieved through voluntary agreement with the food industry.

7.17. **We invite the Government to explain why their policy on food labelling and marketing of unhealthy products to children is not in accordance with the available evidence about changing behaviour. Given the evidence, we recommend that the Government take steps to implement a traffic light system of nutritional labelling on all food packaging. We further recommend that the Government reconsider current regulation of advertising and marketing of food products to children, taking a more realistic view of the range of programmes that children watch.**

Partnership working and voluntary agreements

7.18. The Foresight report favoured tackling obesity through a partnership between government, science, business and civil society. In Chapter 5 we suggested that Change4Life is a positive example of partnership working (see Box 8, page 37). DH is also pursuing voluntary agreements with businesses as part of their attempt to change the environment through the Public Health Responsibility Deal (see Box 10, page 39). The first agreements under the food network of the Deal were published in March 2011. The only pledge relating to obesity is:

> "We will provide calorie information for food and non-alcoholic drink for our customers in out of home settings from 1 September 2011 in accordance with the principles for calorie labelling agreed by the Responsibility Deal".[291]

The Government's principles for calorie labelling are that calorie information should be: displayed clearly and prominently at point of choice; provided for standardised food and drink items sold; provided per portion, item or meal; and, displayed in a way that is appropriate for the consumer.[292]

7.19. In Chapter 5, we noted that the pledges made by the alcohol network were criticised by a number of health organisations (see Box 10, page 39). The pledge made by the food network is more specific than those made by the alcohol network and gives a defined time period for its completion. DH has not, however, specified the outcome measures which it will use to establish whether or not this pledge has had an impact on purchasing and eating behaviour, and when and on what basis they will make a decision on whether it should pursue alternative action to change behaviour. Moreover, this pledge does not reflect the evidence about the need to make substantial changes to the environment in order to tackle obesity at a population level, or the evidence that traffic light labels are the most effective form of labelling (see paragraphs 7.14–7.17 above).

Conclusion

7.20. **We draw attention to our recommendation in paragraph 5.27 about the failures of all current pledges made by the Public Health Responsibility Deal. Moreover, obesity is a significant and urgent societal problem and the current Public Health Responsibility Deal pledge on obesity is not a proportionate response to the scale of the problem. If the Government intend to continue to use agreements with businesses as a way of changing the population's behaviour, we urge them to ensure that these are based on the best available evidence about the most effective measures to tackle obesity at a population level. In particular, they should consider the ways in which businesses themselves influence the behaviour of the population in unhealthy ways. If effective measures cannot be achieved through agreement, the Government must pursue them through other means.**

---

[291] *The Public Health Responsibility Deal, op. cit.*

[292] *Ibid.*

Weight management interventions

7.21. Although there is evidence about how to change behaviour when interventions are targeted at individuals (for example through commercially provided weight loss programmes which encourage changes to diet and physical activity behaviour),[293] some witnesses suggested that, at present, many weight management interventions are poorly evaluated. As a result, there is a lack of understanding about how these interventions affect behaviour, particularly in the long term.[294]

7.22. The Health Trainers programme allows clients to select goals and the majority choose to pursue changes in eating and physical activity. The design of this intervention was informed by health psychologists from the BPS working within DH under the previous Government. Health Trainers' practice is based on the Health Trainer Handbook developed by health psychologists on the basis of evidence of effective techniques for changing behaviour, including motivational interviewing, specific goal setting, self-monitoring, feedback and goal review. These techniques are directed towards enhancement of individual motivation and self-efficacy for change. The importance of these principles is identified in 2007 NICE guidance on behaviour change based on a review of available evidence.

7.23. The programme is also designed to reduce health inequalities, by targeting those in lower socio-economic groups and ethnic minorities.[295] The Health Trainers intervention is an example of effective collaboration between policy makers and experts leading to the development of evidence-based policies. There have however been problems with evaluation of the programme, particularly because of a lack of adequate controls as a result of insufficient funding and the poor quality data collected in local areas (see Box 15, page 49).

7.24. Problems with the evaluation of the Health Trainers programme reflect wider concerns about a lack of evidence-based commissioning and proper evaluation of weight management interventions at the local level (see paragraph 5.32 above). The National Obesity Observatory has developed a Standard Evaluation Framework for weight management interventions in order to support high quality evaluation.[296] The extent to which this is used is however unclear.[297]

Conclusion

7.25. Given these concerns about evidence-based commissioning and evaluation, **we recommend that DH should commission a review of the provision of weight management services, including the Health Trainers programme, across the country. We recommend further that NICE should compile a list of approved weight management services which adhere to their best practice guidance. If the Health Trainers programme is included in this list, we recommend that the**

Government should continue the programme, particularly in the light of its focus on tackling health inequalities.

Case Study 2: reducing car use

7.26. Greenhouse gas emissions from transport represent 21% of the total United Kingdom domestic emissions. Emissions from private car use constitute 78% of that figure, representing 17% of total emissions or 91.5 million tonnes of CO_2 in 2008. Although technological measures are important in reducing emissions, it is argued they are unlikely to be sufficient to achieve the necessary reduction in carbon emissions in the short term.[298] A significant reduction in car use is also needed.

What does the evidence say about how to reduce car use?

7.27. An individual's choice of transport mode is influenced by a number of factors. Social norms, habitual and automatic behaviour and public transport infrastructure have been identified as particularly important. For many drivers, it appears that environmental awareness is not an important factor, although people can be motivated to change their driving habits because of the health benefits of walking and cycling.[299] Changing choice of transport mode is likely to require a range of interventions, including interventions to change individual behaviour or attitudes, interventions to change the environment, and regulatory and fiscal measures.[300] Dr David Metz, former CSA at the DfT, observed with regard to the latter that without such 'upstream' regulatory and fiscal disincentives, a reduction in car use by some will tend to be offset by others taking advantage of reduced congestion.[301]

7.28. Many witnesses observed that "mode choice" was not the only factor in reducing car use. Professor Goodwin noted, for example, that little over a quarter of the decline in car use over the past decade could be accounted for by individuals using different modes of transport, the remainder was as a result of shortening journey distances and fewer journeys being undertaken.[302] Other witnesses cited the increased use of telecommunications and changing commuting patterns as significant factors.[303]

Fiscal measures and disincentives to car use

7.29. Many witnesses argued that policies that provide a direct disincentive to car use were most effective, if accompanied by improvements to alternative transport services. Successful examples of this included parking controls and road user charges,[304] and vehicle ownership taxes and fuel duties. While the latter are likely to be an effective intervention, it was acknowledged that they might fall disproportionately on rural drivers.[305] Examples of effective non-fiscal disincentives included measures to reduce road capacity and to calm

traffic, and pedestrianisation of city centres.[306] There is substantial evidence about the impact of the latter from European cities.[307]

Infrastructure

7.30. Some witnesses argued that "urban form", where the physical environment is designed to suit lifestyles, has developed around roads and cars in the United Kingdom. This creates a strong lock-in to cars as the primary form of personal transport and the car is seen by many as more convenient than other modes of transport.[308] While infrastructural changes alone may not be sufficient to change behaviour,[309] they are an effective and often necessary component of a package of interventions. This view is supported by the results of the DfT Sustainable Travel Towns pilots (see Box 18, page 64) which showed that there was a correlation between increases in cycling and bus use and investment in infrastructure, and that marketing and promotion without changes to infrastructure had little effect.[310]

7.31. Changes to infrastructure have to be appropriately targeted to the people, places and journeys which are most susceptive to influence.[311] The Cycling Demonstration Town programme, for example, suggested that infrastructure improvement was best focused on main routes to important destinations such as schools, workplaces and shopping centres.[312]

Information provision

7.32. Whilst information provision in isolation may have limited effect,[313] evidence suggests that large-scale education campaigns, together with other measures such as fiscal interventions and improvements to infrastructure, can be effective in changing behaviour.[314] The DfT agreed that behaviour change usually requires a package of interventions of which the provision and presentation of information is one aspect.[315] The provision of information and personalised travel planning were features of the Sustainable Travel Towns pilots and, according to some witnesses, they had a high impact and were cost-effective.[316]

Strengths and weaknesses of the evidence-base

7.33. A number of witnesses suggested that there now exists an extensive and well-researched evidence-base in the area of mode choice, in contrast to other policy areas, and that lack of knowledge and experience are not the main barrier to successful initiatives to change behaviour.[317] The UKCRC Centre

for Diet and Activity Research Centre suggested, however, that there is limited evidence from well-designed studies to indicate the most effective interventions to change travel mode share in the population. This reflects the point made above that there is a lack of applied research at a population level. This did not, they said, mean that there were no effective interventions but rather that approaches which showed promise should be developed further and more rigorously evaluated.[318]

7.34. Some witnesses identified, in particular, a lack of evidence about how to reduce car use for medium-length trips. This is an important gap in the evidence-base, as figures suggest that trips of less than 10 miles only contribute 36% of carbon emissions from cars, while trips of more than 10 miles account for 64%.[319] Transport for Quality of Life agreed that interventions intended to reduce carbon emissions should focus on medium and longer trips.[320] **We recommend that the DfT should prioritise funding to research the most effective behaviour change interventions to reduce car use for medium and longer-length journeys and undertake pilots of those interventions as soon as possible.**

Are the Government's policies based on the evidence?

7.35. The Government's approach to changing travel behaviour was outlined in the *Creating Growth, Cutting Carbon* white paper published in January 2011. Key elements are:

- promoting and enabling choice rather than restricting choice;
- integrated policy packages;
- promoting alternatives to travel (see paragraph 7.28); and
- the localism agenda (the Sustainable Transport Fund).

Promoting and enabling choice

7.36. The DfT focus on promoting and enabling choice is consistent with the Government's more general approach in favour of non-regulatory and non-fiscal measures (see paragraphs 5.2–5.15 above). As a result, the Government's sustainable transport policy is marked by an absence of significant fiscal and regulatory disincentives to change behaviour. But, as we have said (in paragraph 7.29), the evidence indicates that strong disincentives, many of which are likely to be financial, are a key element in changing travel-mode choices. **Bearing in mind our concern (see paragraph 5.14 above) that the Government's preference for non-regulatory interventions may lead officials to give insufficient consideration to regulatory and fiscal interventions, we urge the DfT to ensure that evidence for both non-regulatory and regulatory measures is taken into account when formulating policies to reduce car use.**

7.37. An emphasis on promoting and enabling choice also confirms the importance of having an infrastructure which provides a broader range of cheap and

---

[318] BC 139.

[319] BC 126, BC 127, BC 140.

[320] BC 127.

efficient public transport services. We were told that European cities with low levels of car use have consistently spent far more per person on infrastructure. Cycling England said in relation to cycling, for example: "levels of expenditure on cycling in successful European towns and cities ... were at least £10 per head of population per year. By contrast, analysis of Local Transport Plan outturn expenditure data for English local authorities, carried out at our request by the Department for Transport, demonstrated that the average level of spend by English local authorities was less than £1 per head of population per year".[321] In our seminar on reducing car use, it was noted that spend per person in Copenhagen was around £40 per head of population per year.[322]

7.38. The Sustainable Transport Fund (see paragraphs 7.44–7.46) will provide for improvements to infrastructure in a local context, though, we were told, it would "not support major rail, passenger transport or road infrastructure enhancements, which would be more appropriately funded from other sources".[323] Ms Sloman of Transport for Quality of Life highlighted concerns that:

> "... at a time when Local Authorities are facing severe cutbacks, they will be in a position where they are cutting money for Sunday bus services, socially supported bus services, all sorts of other local transport services and yet getting funding to promote bus use. We certainly know from the Sustainable Travel Town evaluation that if you have a worsening service, promotion of it isn't going to get more people using it."[324]

But in response, Mr Dowie said that the DfT "still have ... a very substantial local capital programme".[325] **As the evidence suggests that good infrastructure is a prerequisite for, and greatly enhances, the effectiveness of other "smarter choices" measures, we strongly encourage the DfT to ensure that, wherever possible in a time of financial stringency, a sufficient proportion of funds is maintained to make effective improvements and changes to infrastructure.**

Integrated policy packages

7.39. The DfT has embraced the use of integrated policy packages as part of its promoting and enabling choice agenda. The Sustainable Travel Towns (STT) initiative (see Box 18, page 64) and the Cycling Cities and Towns programme (see Box 19, page 65) are evidence of the department's commitment to using a whole range of "smarter choices" (see Box 17, page 63) initiatives together with small-scale infrastructure change.

7.40. A number of witnesses welcomed this emphasis on encouraging "smarter choices" within a package of interventions that included other harder measures and the provision of infrastructure, noting that packages are more cost-effective. Ms Sloman said, for example, that "it is by combining the better infrastructure, the better services and the encouragement for people to use those that you get more bang for your buck. You achieve more change

325 Q 642.

for each pound you spend because you are not just improving the service, you are telling people about it".[326] Simon Houldsworth, Transport Policy Manager for Darlington, agreed that "without the package you will not get the benefits or the value for money that travel behaviour delivers".[327]

7.41. **Whilst we welcome the DfT's emphasis on the use of policy packages, we note they do not include regulatory and fiscal measures and so do not wholly reflect the evidence about how to change transport mode choice. This suggests that their effectiveness and, in turn, their cost-effectiveness could well be limited.**

BOX 17

"Smarter Choices"

The term "smarter choices" was used by most witnesses in relation to interventions to change travel behaviour. This term originated with the 2004 DfT report, *Smarter choices: changing the way we travel.*[328]

There was disparity across the evidence we received about what sorts of interventions should be classified as "smarter choices". Some witnesses told us that "smarter choices" interventions comprise both "soft" measures, such as personal travel planning and local transport marketing, and "hard" measures, such as improvements to infrastructure and pedestrianisation.[329] Others excluded "hard" measures from their descriptions, equating "smarter choices" only with "soft measures".[330] The 2004 report on smarter choices suggests the latter definition—"soft measures"—is more accurate. The 2004 report describes itself as exploring the impact of soft factor interventions and does not address improvements to infrastructure or pedestrianisation. The DfT appear to use this term to describe any intervention that does not make use of regulation or fiscal policy.

Dr Anable, Centre for Transport Research, University of Aberdeen, was clear that "smarter choices" should not be understood as synonymous with "nudges". She noted that "smarter choices" could include nudges but were also about changing social practices and a new approach to policy formulation.[331]

Localism and the sustainable transport fund

7.42. Several witnesses agreed that local authorities were well placed to implement effective interventions to change travel behaviour because they were responsible for local transport infrastructure.[332] Some, however, sounded a note of caution, on the ground that not all local authorities had the necessary range of professional skills and resources to research and interpret the evidence about how to change behaviour (see paragraph 5.31 above).[333] Transport for Quality of Life, for example, said that it was common for "smarter choices" or other behaviour change teams to be employed on short-

326 Q 647.

327 *Ibid.*

328 Professor Goodwin told us that the report was originally entitled "soft measures" (Q 588).

333 BC 121, BC 127, BC 136.

term contracts in local authorities. This has prevented local authorities from building up the necessary expertise.[334]

7.43. A similar point was made in relation to a lack of skills within local authorities to evaluate interventions properly.[335] Mr Dowie told us that the DfT was not expecting local authorities to have these skills and that the department had a responsibility to ensure that an evaluation framework was in place. To that end they have published evaluation guidance for sustainable transport interventions (see paragraph 5.33 above).[336] We note however that the Sustainable Transport white paper states that local authorities themselves will be responsible for sharing what works and developing a framework to improve capability at the local level (see paragraph 5.34 above).

BOX 18

The Sustainable Travel Towns initiative

The STT initiative ran between 2004 and 2009 in Darlington, Peterborough and Worcester. The pilots were designed to explore the effectiveness of "smarter choices" measures, therefore excluding fiscal or regulatory measures. Each of the towns employed multi-faceted packages of interventions incorporating a range of non-regulatory and non-fiscal measures, such as:

- The provision of infrastructure: on a modest scale and with a focus on cycling and pedestrians.
- The provision of new services, such as car sharing schemes, car clubs and community transport services.
- The provision of education and propaganda.
- Emphasis on community involvement.
- The engagement of individuals through consultation exercises, competitions, newsletters and feedback.[337]

This package of measures achieved a reduction in the number of car driver trips by 9% and car driver distance by 5–7%,[338] though witnesses raised some concerns about its evaluation (see paragraph 6.5 above).

7.44. The local sustainable transport fund is the successor to the STT pilots (see Box 18, page 64). The fund will make £560 million available over four years for "smarter choices" local sustainable travel interventions. The DfT describes the purpose of the fund as giving "local transport authorities the opportunity, working in partnership with their communities, to identify the right solutions that meet the particular challenges faced in their areas and deliver the greatest benefits for their communities".[339]

7.45. The department has developed an Enabling Behaviour Change Information Pack for bidders to the Sustainable Transport Fund. The Pack sets out the

[339] *Ibid*.

evidence about effective interventions from Cycling Cities and Towns and the STT pilots. It is intended to help those who bid for funding to base their bids on the available evidence about what works.[340] Whilst we acknowledge that this is a useful development, we note that the guidance simply lists the interventions and does not provide analysis of their effectiveness or contain very much about the use of fiscal measures and other disincentives to car use. Though we recognise that some disincentives to reduce car use would need to be implemented centrally (such as changes to fuel pricing policy), there are still others that are available to local authorities (such as increased parking charges, pedestrianisation and road user charges) and it will be particularly important that central government provides direction in relation to such disincentives in the light of the suggestion from some witnesses that local authorities are reluctant to implement these measures for fear of competition from other cities and lost revenue.[341]

BOX 19

Cycling Cities and Towns

The Cycling Cities and Towns programme has built on the first six cycling demonstration towns. The demonstration towns used multi-faceted packages of interventions to increase cycling, including "new cycle infrastructure; Bikeability cycle training; intensive programmes targeted at schools and workplaces; initiatives to remove barriers to cycling by providing equipment, building skills and increasing confidence; and awareness-raising campaigns under strong brands".[342] These towns saw an average increase in cycling of 27%. The Cycling Cities and Towns programme is based on the evidence of effectiveness of interventions in the demonstration towns.

7.46. **Although we welcome the principle of DfT's Local Sustainable Transport Fund, the initiative is based on a pilot project which was incompletely evaluated and so did not provide evidence about the long-term effectiveness of interventions. Furthermore, as we have noted in paragraph 7.41, the Sustainable Travel Towns pilot did not wholly reflect the evidence about how to change transport mode choice.**

7.47. **We commend DfT's recognition that, if responsibility for interventions is to be devolved to local agents, guidance to commissioners on the evidence and an evaluation framework are necessary. We note, however, that current guidance does not take into account the evidence about the need for strong disincentives to car use needed to achieve significant changes in behaviour and fails to provide any analysis of the evidence associated with effective interventions.**

7.48. We are not clear about the extent to which Government intend to reduce carbon emissions by reducing car use but, if they hope to achieve a significant reduction, the evidence suggests that regulatory and fiscal disincentives to car use will be required. **We recommend that the**

Government (a) establish and publish targets for a reduction in carbon emissions as a result of a reduction in car use; (b) publish an estimate of the percentage reduction in emissions which will be achieved through reducing car use and the timescale for its achievement; and (c) set out details of the steps they will take if this percentage reduction is not achieved by this time.

CHAPTER 8: CONCLUSIONS AND RECOMMENDATIONS

Definitions, categorisation and the ethics of behaviour change interventions (Chapter 2)

Interventions and ethical acceptability

8.1. The idea of the Government intervening to change people's behaviour will often be controversial, and so it is important that ministers are always able to explain the evidence-base of any proposed behaviour change intervention, and why it is a necessary and proportionate means of addressing a well-defined problem (paragraph 2.20).

Understanding what influences behaviour (Chapter 3)

Applied research at a population level

8.2. There is a lack of applied research at a population level to support specific interventions to change the behaviour of large groups of people (including a lack of evidence on cost-effectiveness and long-term impact). This is a barrier to the formulation of evidence-based policies to change behaviour. To address this problem, the Government will need both to evaluate their own behaviour change interventions rigorously and establish new evidence by commissioning and funding more applied behavioural research on this scale (paragraph 3.10).

Evidence-based policy (Chapter 4)

Are Government policies evidence-based?

8.3. We acknowledge that there will be occasions when it is legitimate for a government not to implement behaviour change interventions for which there is good evidence of effectiveness. In these circumstances, however, we believe that ministers have a responsibility to explain why they have decided not to do so (paragraph 4.7).

8.4. We agree with the principle, stated in the Government's *Principles of Scientific Advice*, that ministers should explain publicly their reasons for policy decisions, particularly when a decision is not consistent with scientific advice and, in doing so, should accurately represent the evidence. This places a responsibility on scientists and social scientists within government to ensure that ministers are provided with accurate and up-to-date advice on the available evidence about how to change behaviour so that they can identify where and why they are not basing a policy on the evidence (paragraph 4.8).

Addressing the barriers to evidence-based policy

8.5. We urge ministers to consult their departmental Chief Scientific Advisers about whether the amount of money spent on applied behaviour change research at a population level is sufficient to meet their policy needs (paragraph 4.16).

Translation of research

Role of Government scientists

8.6. We recommend that, at the earliest opportunity, the Government appoint a Chief Social Scientist who reports to the Government Chief Scientific Adviser and is an independent expert in social science research to ensure the provision of robust and independent social scientific advice (paragraph 4.23).

8.7. We further recommend that the Government consider whether existing mechanisms for the provision of social scientific advice, in particular advice on behavioural science, are fit for purpose. This should include consideration of how departmental Chief Scientific Advisers and social scientists within departments can best work together to provide up to date social scientific advice to support evidence-based behaviour change interventions (paragraph 4.24).

Better links between the academic and policy making communities

8.8. Departmental Chief Scientific Advisers, whether or not they have experience of the sciences of human behaviour, should be responsible for establishing and maintaining contacts with leading behavioural scientists with expertise relevant to their policy areas and for consulting them as necessary (paragraph 4.30).

Behavioural insights for policy makers

8.9. We recommend that the Cabinet Secretary, in consultation with the Government Chief Scientific Adviser and Chief Social Scientist, once appointed, should take steps to ensure that civil servants with responsibility for policy making have the necessary understanding of the importance of changing behaviour and can identify the most appropriate people to consult in their own departments about the development of behaviour change interventions (paragraph 4.32).

Guidance to policy makers

8.10. We recommend that the Cabinet Office, in consultation with the Chief Social Scientist, once appointed, consider how to consolidate the available guidance in a form which is evidence-based and accessible to policy makers (paragraph 4.35).

8.11. We further recommend that the National Institute for Clinical Excellence updates its 2007 Behaviour Change Guidance and considers whether accessible, multi-disciplinary guidance could be provided in relation to health-related behaviour change policies, particularly to offer more explicit advice on how behaviour change techniques could be applied to reduce obesity, alcohol abuse and smoking (paragraph 4.36).

Sharing knowledge across Government

8.12. We recommend that the Cabinet Office, together with the Government Chief Scientific Adviser and Chief Social Scientist, once appointed, review the current mechanisms for sharing knowledge about behaviour change among government departments with a view to introducing a more streamlined structure (paragraph 4.41).

8.13. We recommend further that this revised structure should involve the continuation of work begun on the "inventory of behaviours" in order to establish an archive of behaviour change interventions. This archive should provide accounts of the evaluation of the interventions and include unsuccessful as well as successful interventions (paragraph 4.42).

The Government approach to changing behaviour (Chapter 5)

The need for a range of interventions

8.14. In general, the evidence supports the conclusion that non-regulatory or regulatory measures used in isolation are often not likely to be effective and that usually the most effective means of changing behaviour at a population level is to use a range of policy tools, both regulatory and non-regulatory. Given that many factors may influence behaviour, this conclusion is perhaps unsurprising (paragraph 5.13).

8.15. We welcome efforts by the Government to raise awareness within departments of the importance of understanding behaviour, and the potential this has for the development of more effective and efficient policies. We are concerned, however, that emphasising non-regulatory interventions will lead to policy decisions where the evidence for the effectiveness of other interventions in changing behaviour has not been considered. This would jeopardise the development of evidence-based, effective and cost-effective policies (paragraph 5.14).

8.16. We therefore urge ministers to ensure that policy makers are made aware of the evidence that non-regulatory measures are often not likely to be effective if used in isolation and that evidence regarding the whole range of policy interventions should be considered before they commit to using non-regulatory measures alone (paragraph 5.15).

Partnership working and voluntary agreements

8.17. The involvement of other organisations to support the Government's behaviour change initiatives may provide valuable opportunities to improve the effectiveness of behaviour change interventions, in particular by allowing a range of messengers to be used to deliver them. We welcome the Government's intention to use such collaborations (paragraph 5.25).

8.18. However, we have major doubts about the effectiveness of voluntary agreements with commercial organisations, in particular where there are potential conflicts of interest. Where voluntary agreements are made, we recommend that the following principles should be applied in order to ensure that they achieve their purpose:

- The Government should specify clearly what they want businesses to do based on the evidence about how to change behaviour, and what steps they will take to achieve the same result if voluntary agreements are not forthcoming, or prove ineffective.
- Voluntary agreements should be rigorously and independently evaluated against measurable and time-limited outcomes (paragraph 5.26).

8.19. Given that these principles do not appear to have been applied consistently to the Public Health Responsibility Deal Network, we urge the Department of Health, in particular, to ensure that these principles are followed when

negotiating further voluntary agreements. In relation to the current agreements, we recommend that the Department of Health should state for each pledge what outcomes are expected and when, and provide details of what steps they will take if the agreements are not effective at the end of the stated period (paragraph 5.27).

The role of local authorities

8.20. Although decentralising responsibility may provide a useful opportunity to tailor local behaviour change initiatives and to help build the evidence-base for applied behaviour change research at the population level, steps should be taken to ensure that interventions are evidence-based and properly evaluated. To this end, we recommend that the Government:

- produce guidance for local authorities on how to use evidence effectively to design, commission and evaluate interventions and on the need to involve experts in the design and evaluation process, and provide advice on how to best use the tendering process to ensure value for money;
- take steps to ensure that evaluation of interventions, including data collection and reporting of behaviour change outcomes, across local areas is of sufficiently high quality to allow comparisons and analysis;
- takes steps to ensure that what is learnt by a local government in one place can be readily transmitted to other local governments; and
- provide funding only for those schemes which are based on sound evidence. Demonstration of rigorous evaluation and contribution to the evidence-base should be a requirement for future funding for behaviour change interventions (paragraph 5.30).

Evaluation of behaviour change interventions (Chapter 6)

Ensuring effective evaluation

8.21. Effective evaluation requires that:

- evaluation should be considered at the beginning of the policy design process. External evaluation expertise should be sought, where necessary, from the policy's inception;
- relevant outcome measures—as distinct from outputs—should be established at the beginning of the policy development process;
- the duration of the evaluation process should be sufficiently long-term to demonstrate that an intervention has resulted in maintained behaviour change;
- pilot studies, using population-representative samples, followed by controlled trials assessing objective outcomes should be used whenever practicable; and
- sufficient funds should be allocated for evaluation, recognising that establishing what works, and why, is likely to result in better value for money in the long-term (paragraph 6.14).

8.22. We find however that, at present, evaluations of Government behaviour change interventions often lack one or more of these necessary elements. While we welcome the Government's revision of the Magenta Book, the

evaluation guidance for policy makers and analysts, we believe that it could be further improved. We recommend that the Government consult external evaluation experts on the creation of a concise document for policy makers, containing only the most important principles of evaluation. We further recommend that they make clear what steps they will take to ensure that the revised guidance leads to a change in evaluation culture across Whitehall (paragraph 6.15).

Case studies (Chapter 7)

Case study 1: tackling obesity

Change4Life

8.23. It appears that the Change4Life programme has, on the whole, been evidence-based and appropriately targeted. We note the Government's commitment to continue using the brand and urge the Department of Health to ensure that future evaluations are robust and establish whether or not the programme is likely to be successful in the longer term (paragraph 7.12).

Population wide interventions: advertising, marketing and food labelling

8.24. We invite the Government to explain why their policy on food labelling and marketing of unhealthy products to children is not in accordance with the available evidence about changing behaviour. Given the evidence, we recommend that the Government take steps to implement a traffic light system of nutritional labelling on all food packaging. We further recommend that the Government reconsider current regulation of advertising and marketing of food products to children, taking a more realistic view of the range of programmes that children watch (paragraph 7.17).

Voluntary agreements

8.25. We draw attention to our recommendation about the failures of all current pledges made by the Public Health Responsibility Deal (see paragraph 8.19). Moreover, obesity is a significant and urgent societal problem and the current Public Health Responsibility Deal pledge on obesity is not a proportionate response to the scale of the problem. If the Government intend to continue to use agreements with businesses as a way of changing the population's behaviour, we urge them to ensure that these are based on the best available evidence about the most effective measures to tackle obesity at a population level. In particular, they should consider the ways in which businesses themselves influence the behaviour of the population in unhealthy ways. If effective measures cannot be achieved through agreement, the Government must pursue them through other means (paragraph 7.20).

Weight management interventions

8.26. We recommend that the Department of Health should commission a review of the provision of weight management services, including the Health Trainers programme, across the country. We recommend further that the National Institute for Clinical Excellence should compile a list of approved weight management services which adhere to their best practice guidance. If the Health Trainers programme is included in this list, we recommend that the Government should continue the programme, particularly in the light of its focus on tackling health inequalities (paragraph 7.25).

Case study 2: reducing car use

Weaknesses of the evidence-base

8.27. We recommend that the Department for Transport should prioritise funding to research the most effective behaviour change interventions to reduce car use for medium and longer-length journeys and undertake pilots of those interventions as soon as possible (paragraph 7.34).

Promoting and enabling choice: the role of regulation and infrastructure

8.28. Bearing in mind our concern that the Government's preference for non-regulatory interventions may lead officials to give insufficient consideration to regulatory and fiscal interventions (see paragraph 8.15), we urge the Department for Transport to ensure that evidence for both non-regulatory and regulatory measures is taken into account when formulating policies to reduce car use (paragraph 7.36).

8.29. As the evidence suggests that good infrastructure is a prerequisite for, and greatly enhances, the effectiveness of other "smarter choices" measures, we strongly encourage the Department for Transport to ensure that, wherever possible in a time of financial stringency, a sufficient proportion of funds is maintained to make effective improvements and changes to infrastructure (paragraph 7.38).

Integrated policy packages

8.30. Whilst we welcome the Department for Transport's emphasis on the use of policy packages, we note they do not include regulatory and fiscal measures and so do not wholly reflect the evidence about how to change transport mode choice. This suggests that their effectiveness and, in turn, their cost-effectiveness could well be limited (paragraph 7.41).

Localism and the Sustainable Transport Fund

8.31. Although we welcome the principle of the Department for Transport's Local Sustainable Transport Fund, the initiative is based on a pilot project which was incompletely evaluated and so did not provide evidence about the long-term effectiveness of interventions. Furthermore, (see paragraph 8.30), the Sustainable Travel Towns pilot did not wholly reflect the evidence about how to change transport mode choice (paragraph 7.46).

8.32. We commend the Department for Transport's recognition that, if responsibility for interventions is to be devolved to local agents, guidance to commissioners on the evidence and an evaluation framework are necessary. We note, however, that current guidance does not take into account the evidence about the need for strong disincentives to car use needed to achieve significant changes in behaviour and fails to provide any analysis of the evidence associated with effective interventions (paragraph 7.47).

8.33. We recommend that the Government (a) establish and publish targets for a reduction in carbon emissions as a result of a reduction in car use; (b) publish an estimate of the percentage reduction in emissions which will be achieved through reducing car use and the timescale for its achievement; and (c) details of the steps they will take if this percentage reduction is not achieved by this time (paragraph 7.48).

APPENDIX 2: LIST OF WITNESSES

Evidence

Evidence is published online at www.parliament.uk/hlsciencesub1 and available for inspection at the Parliamentary Archives (020 7219 5314).

Evidence received by the Committee is listed below in order of receipt and in alphabetic order. Witnesses without a * gave written evidence only. Witnesses marked with a * gave both oral and written evidence. Witnesses marked with ** gave oral evidence and did not submit any written evidence.

Oral evidence in chronological order

*	(QQ 1–50)	Dr David Halpern, Head of the Behavioural Insights Team, Cabinet Office, and the Government Economic and Social Research Team
*	(QQ 51–85)	Dr Sunjai Gupta, Head of Public Health Strategy and Social Marketing, Department of Health, Ms Sian Jarvis, Director-General of Communications, Department of Health, Dr Gemma Harper, Chief Social Scientist, Department for Environment, Food and Rural Affairs and Central Office of Information
*	(QQ 86–138)	Professor Susan Michie, Professor of Health Psychology, University College London, Professor Elizabeth Shove, Professor of Sociology, Lancaster University, Professor Imran Rasul, Professor of Economics, University College London, Dr Wendy Ewart, Director of Strategy, Medical Research Council (MRC), and Dr Dawn Woodgate, Economic and Social Research Council
*	(QQ 139–184)	Professor Mike Kelly, National Institute for Clinical Excellence, Professor John Britton, University of Nottingham and Director of the UK Centre for Tobacco Control Studies, and Dr Tim Chatterton, University of the West of England
*	(QQ 185–225)	Professor Lyndal Bond, Leader of the MRC programme "Evaluating the Health Effects of Social Interventions", Professor Ray Pawson, Professor of Social Research Methodology, University of Leeds, Professor David Gunnell, Professor of Epidemiology in the School of Social and Community Medicine, University of Bristol, Dr Siobhan Campbell, Head of Policy Evaluation, Department of Energy and Climate Change, and Mr Mike Daly, Department for Work and Pensions
*	(QQ 226–261)	Institute of Practitioners in Advertising, M&C Saatchi, and Unilever
*	(QQ 262–282)	Drinkaware, Groundwork, and Swanswell
**	(QQ 283–329)	Department of Energy and Climate Change, Department for Environment, Food and Rural Affairs, and Growing Against Gangs Foundation

*	(QQ 330–349)	Dr Melvyn Hillsdon, University of Exeter, Dr Ian Campbell, Medical Director of Weight Concern, and Professor Theresa Marteau, King's College London and University of Cambridge
*	(QQ 350–386)	Department of Health and Professor Erik Millstone, Professor of Science Policy, University of Sussex
*	(QQ 387–430)	Living Well West Midlands, Great Yarmouth Community Trust, Yorkshire and Humber Health Trainer Team and Central YMCA
*	(QQ 431–455)	Ms Katherine Kerswell, Group Managing Director of Kent County Council, and former president of the Society of Local Authority Chief Executives (SOLACE), Association of Public Health Directors, Weight Watchers, and MEND Central
*	(QQ 456–475)	Sainsbury's
*	(QQ 476–502)	Diageo
*	(QQ 503–554)	Asda, and the Fitness Industry Association
*	(QQ 555–574)	UK Faculty of Public Health, British Medical Association, and Dr Susan Jebb, Head of Nutrition and Research, MRC, and Chair, Cross-Government Expert Advisory Group on Obesity and the Responsibility Deal Food Network
*	(QQ 575–594)	Dr Stephen Skippon, Principal Scientist, Shell Global Solutions, Dr Jillian Anable, Centre for Transport Research, University of Aberdeen, and Professor Phillip Goodwin, Centre for Transport and Society, University of the West of England
*	(QQ 595–628)	Dr Lorraine Whitmarsh, Environmental Psychologist, Cardiff University, Professor Peter Bonsall, Professor of Transport Planning, University of Leeds, Sustainable Development Commission, and Professor David Banister, Director, Transport Studies Unit, University of Oxford
*	(QQ 629–675)	Department for Transport, Darlington Council, Worcestershire Council, and Transport for Quality of Life
*	(QQ 676–701)	Sustrans, RAC Foundation, Cycling England, and Stagecoach UK Bus
*	(QQ 702–740)	Mr Oliver Letwin MP, Minister of State, Cabinet Office, Ms Anne Milton MP, Parliamentary Under Secretary of State for Public Health, and Mr Norman Baker MP, Parliamentary Under Secretary of State for Transport

Alphabetical Order

Action on Smoking and Health (BC 82)

Advertising Association (BC 102)

Ajinomoto (BC 99)

** Dr Jillian Anabel, University of Aberdeen

Professor Kevin Anderson, Mr Dan Calverley and Dr Alice Bows, University of Manchester (BC 140)

Association for the Study of Obesity (ASO) (BC 58)

Astarte Programme (BC 92)

** Dr Frank Atherton, President of the Association of Public Health Directors

Professor Thomas Baldwin, University of York (BC 66)

* Professor David Banister, University of Oxford (BC 119)

Professor Erik Bichard, University of Salford (BC 23)

Dr Alison Bish and Professor Susan Michie, University College London (BC 29)

** Dr Peter Blake, Head of Integrated Transport, Worcestershire Council

* Professor Lyndal Bond, Programme Leader of the MRC Programme: "Evaluating the Health Effects of Social Interventions" (BC 150)

* Professor Peter Bonsall, University of Leeds (BC 125, 155)

Mr Donald Bowler (BC 120)

* ESRC Centre for Business Relationships, Accountability, Sustainability and Society (BRASS) (BC 46)

* ESRC Centre for Business Relationships, Accountability, Sustainability and Society (BRASS) and the School of City and Regional Planning, Cardiff University (BC 135)

Brighton and Hove Food Partnership (BC 59)

British Academy (BC 78, 134)

British Association for Applied Nutrition and Nutritional Therapy (BANT) (BC 22)

British Heart Foundation (BC 48)

* British Medical Association (BMA) (BC 53)

British Retail Consortium (BRC) (BC 47)

British Psychological Society (BC 105)

British Trust for Conservation Volunteers (BTCV) (BC 77)

Mr Eric Britton, New Mobility Agenda and World Streets (BC 142)

Cambridge Weight Plan (BC 49)

Camden Weight Loss Research Team (CAMWEL) (BC 44)

The Campaign Company (TCC) (BC 89)

** Dr Ian Campbell, Medical Director, Weight Concern

Professor Martin Caraher, City University London (BC 19)

* Central Office of Information (COI) (BC 76)

* Central YMCA (BC 85)

UKCRC Centre for Diet and Activity Research (CEDAR) and the Behaviour and Health Research Unit (BHRU), Institute of Public Health, University of Cambridge (BC 139)

Centro (BC 137)

Mr Kelvin Chan, University of Cambridge (BC 55)

** Dr Tim Chatterton, University of the West of England, Bristol

Professor Robert Cialdini, Arizona State University and Steve Martin, Influence at Work (BC 13)

Claradan and ClaradanMetrics (BC 60)

Dr John Coggon LLB, PhD, University of Manchester (BC 93)

Dr Adam Corner, Dr Lorraine Whitmarsh, Professor Nick Pidgeon and Professor Greg Maio, Cardiff University (BC 31)

Joan Costa-Font, London School of Economics (BC 3)

Countryside and Community Research Institute (CCRI) (BC 39)

Cyclists' Touring Club (CTC) (BC 130)

Cycle to Work Alliance (BC 143)

* Cycling England (BC 131, 163)

Andrew Dapaah, Tinashe Chirenje, Ann Paraiso, Vivienne Richards, Lucy Reynolds and Kazira von Selmont, Leicester University Medical Students (BC 112)

Andrew Darnton, AD Research & Analysis Ltd (BC 86)

** Professor Lindsey Davies, President, UK Faculty of Public Health

* Department of Health (BC 151, 161)

* Department for Transport (BC 138)

Development Education Association (DEA) (BC 63)

* Diageo (BC 115)

Dr Diane Dixon and Professor Marie Johnston (BC 9)

Professor Paul Dolan, Dr Dominic King, Dr Robert Metcalfe, Dr Ivo Vlaev (BC 103)

Do Something Different Behaviour Change Programme (BC 18)

* Drinkaware (BC 98, 154)

** Mr Tim Duffy, Chief Executive, M&C Saatchi

Dr Mike Esbester, Oxford Brookes University (BC 113)

Sandy Evans, ProHealthClinical (BC 69)

** Dr Wendy Ewart, Director of Strategy, Medical Research Council

* Fitness Industry Association (BC 159)

Dr Bennett Foddy and Dr Eric Mandelbaum, Oxford University (BC 56)

Food and Drink Federation (FDF) (BC 73)

Food Standards Agency (FSA) (BC 16)

Friends of the Earth and Campaign for Better Transport (BC 145)

Dr Benjamin Gardner and Dr Phillippa Lally, University College London (BC 68)

* Dr Benjamin Gardner, Professor Susan Michie, University College London and Professor Nichola Rumsey, University of the West of England (BC 43)

Gateway Family Services (BC 12)

Global Action Plan (BC 51)

* Professor Phil Goodwin, University of the West of England (BC 133)

* Government Economics Service (GES) and the Government Social Research Service (GSR) (BC 24)

* Government (BC 114) (joint departmental submission)

* Great Yarmouth Community Trust (BC 32)

The Green Alliance (BC 107)

Greener Journeys' (BC 129)

Professor Frances Griffiths, University of Warwick (BC 34)

** Professor David Gunnell, University of Bristol

Halton and St Helens—NHS Health Improvement Team (BC 26)

** Mr Tony Hawkhead, Chief Executive, Groundwork

Health and Safety Laboratory (HSL) (BC 87)

Health and Well-Being Alliance (BC 4)

Health, Exercise, Nutrition for the Really Young (HENRY) (BC 62)

HERD Consulting, Mark Earls and Dr Alex Bentley, Durham University (BC 104)

** Dr Melvyn Hillsdon, University of Exeter

Home Office (BC 144)

** Mr Simon Houldsworth, Transport Policy Manager, Darlington Council

Institute for Government (BC 100)

* Institute for Practitioners in Advertising (IPA) (BC 101, 156)

Interaction (BC 40)

International Association for the Study of Obesity (IASO) (BC 91)

** Dr Susan Jebb, Head of Nutrition and Research, Medical Research Council, and Chair, Cross-Government Expert Advisory Group on Obesity and the Responsibility Deal Food Network

Professor Peter John, University of Manchester (BC 8)

Dr Rhys Jones, Dr Jessica Pykett and Dr Mark Whitehead, Aberystwyth University (BC 65)

Keep Britain Tidy (BC 70)

* Mr Paul Kelly, External Affairs and Corporate responsibility Director, Asda (BC 158)

** Ms Katherine Kerswell, Group Managing Director of Kent County Council, and former president of the Society of Local Authority Chief Executives (SOLACE)

* Mr Justin King, Group Chief Executive, Sainsbury's (BC 157)

Mr Robert Langford, Telford and Wrekin Community Health Services (BC 35)

Leeds Metropolitan University, Centre for Food Nutrition and Health (BC 79)

Carolyn Lester, Public Health Wales (BC 10)

* Oliver Letwin MP, Minister of State, Cabinet Office (BC 162)

Dr Alan Lewis MA, PhD: Director, Transport & Travel Research Ltd and Mr John Porter MSc: Director, Interactions Ltd (BC 126)

Lifestyle service, South Staffordshire PCT (BC 20)

APPENDIX 3: CALLS FOR EVIDENCE

The House of Lords Science and Technology Select Committee has appointed a sub-committee, chaired by Baroness Neuberger, to investigate the use of behaviour change interventions to achieve policy goals.

Introduction

To meet many of the societal challenges we are currently facing—such as achieving an 80% reduction in carbon emissions by 2050 or reducing the burden on the health service as a result of smoking, drinking or the rise in obesity—individual and collective behaviour will need to change significantly. Governments, therefore, are becoming increasingly interested in understanding how they can influence the way we behave using a range of different types of behaviour change policy interventions that rely on measures other than prohibition or the elimination of choice. Recent reports, such as the Cabinet Office issue paper *Personal Responsibility and Behaviour Change* (2003), the Government Social Research Unit's *Behaviour Change Knowledge Review* (2008) and the Cabinet Office and Institute for Government report *MINDSPACE: Influencing behaviour through public policy* (2010), are indicative of this growing interest.

The subject is complex. Choosing a behaviour change intervention or a mix of interventions to achieve particular policy goals in particular contexts draws on understanding developed in a large variety of research disciplines, including health psychology, social psychology, behavioural economics, neuroscience and sociology. The insights provided by the development and application of social marketing techniques also make a valuable contribution.

Some behaviour change interventions are recognised as having been very successful. A recent review of more than 1,000 evaluations of health behaviour change interventions has shown that theory- and evidence-based behaviour change interventions can be effective across a range of behaviour change domains. In relation to smoking, for example, the simultaneous application of a number of different types of interventions, including a ban on smoking in public, marketing campaigns to highlight the dangers of smoking and improved and better advertised smoking cessation services within the National health Service is said to have led to a significant reduction in the number of smokers over the last few years. Other interventions, such as efforts to reduce alcohol misuse, have been less successful. We shall be examining, amongst other things, what appears to make one intervention more effective than another.

Scope of the inquiry

The inquiry will examine our current state of knowledge about what interventions can effectively influence behaviour, how behaviour change interventions which have been designed on the basis of that knowledge can be used to achieve policy goals, and what factors should be taken into account by government in determining whether a particular behaviour change intervention is appropriate. It will look at the evidence-base that supports current behaviour change interventions and at the effectiveness of those interventions.

In particular, the inquiry seeks to examine:

- the policy implications of recent developments in research on behaviour change;

- whether current government behaviour change interventions are evidence-based, whether such interventions are appropriately evaluated, and if lessons have been learnt from the process and then applied to further interventions;
- whether there is sufficient expertise within public services (for example, local authorities and the NHS) to ensure that interventions are evidence-based, and implemented and evaluated effectively;
- the extent to which behaviour change interventions require a mixture of different tools to succeed;
- how behaviour change interventions and activities are coordinated across government and beyond;
- the extent to which, and ways in which, government should be accountable to, or engage with, the wider public about the use of behaviour change policy interventions;
- the role of industry and the voluntary sector in shaping behaviour patterns;
- the relationship between government, industry and the voluntary sector in promoting behaviour change to achieve policy goals; finally,
- the social and ethical issues surrounding the use of behaviour change interventions by government.

Case study 1: Tackling obesity

The Committee will conduct two case studies as part of the wider inquiry. The first case study will look at the use of behaviour change policy interventions to tackle obesity. Obesity remains a major challenge for society. In 2008, almost a quarter of adults in England were classified as obese; and 16.8% of boys aged 2 to 15 and 15.2% of girls were also classified as obese, an increase from 11.1% and 12.2% respectively in 1995.[343]

A 2007 Foresight report on obesity, *Tackling Obesities: Future Choices*, called for a systems approach to behaviour change interventions to tackle obesity and, in 2008, the Government launched *Healthy weight: healthy lives*, a cross-government strategy for England which introduced a number of interventions. Nonetheless, prevalence rates amongst some childhood and adolescent groups and adults continue to rise. These trends predict worsening public health, increased pressure on the health service and a very large cost to the national economy.

Questions

Research and Development

1. What is known about how behaviour can be influenced? What special considerations apply to addictive behaviour?

2. What are the policy implications of recent developments in research on behaviour change?

[343] *Statistics on obesity, physical activity and diet: England 2010*, The Information Centre for Health and Social Care, NHS.

3. Is there adequate research capability within the United Kingdom to support the current pace of developments in behaviour change policy interventions? Is there sufficient funding for the evaluation of behaviour change interventions?

Translation

4. Are there adequate structures and expertise across government and the public services more generally to support the translation of research developments in behaviour change into policy interventions?

Policy design and evaluation

General

5. What should be classified as a behaviour change intervention?

6. How should different levels of intervention (individual, organisational, community and national) and different types of intervention (legislative, fiscal, educative) interact in order to achieve policy goals more effectively?

7. Should behaviour change interventions be used in isolation or in combination with other policy interventions?

Practical application

8. Have publicly funded behaviour change interventions been both evidence-based and subject to effective evaluation? How successful have such interventions been?

9. Within government, how are the lessons learnt from the success or lack of success of behaviour change interventions fed back into the design of future interventions? Are lessons learned from industry and voluntary sector behaviour change activities also taken into account?

10. What mechanisms exist, at national and local government level, to provide advice and support during the design, piloting, implementation and evaluation of behaviour change interventions in order to ensure that they achieve intended policy goals and also cultural changes within government and public services more generally?

Cross-government coordination

11. What mechanisms exist within government to coordinate and implement cross-departmental behaviour change policy interventions?

12. What mechanisms exist within government to cascade learning and best practice on behaviour change policy interventions?

Ethical considerations

13. When is it appropriate for the state to intervene to influence the behaviour of members of the public and how does this differ from when it is appropriate for the commercial or voluntary sector to intervene? In particular, when should this be done by outright prohibition and when by measures to encourage behaviour change? Are some methods of producing behaviour change unacceptable? Which and why?

14. Should the public be involved in the design and implementation of behaviour change policy interventions and, if so, how? Should proposed measures for

securing behaviour change be subject to public engagement exercises or consultation? Should they be piloted? Do considerations differ in the case of interventions aimed at changing addictive behaviour?

International comparisons

15. What lessons can be learnt from previous successful or unsuccessful behaviour change interventions in other countries? Which countries provide the most helpful examples of best practice? Are behavioural change interventions generally transferable between different societies?

Tackling Obesity

16. The Committee would particularly welcome submissions on behaviour change interventions, whether in the public sector, the private sector or by voluntary organisations, designed to tackle obesity, in the United Kingdom or internationally, in order to examine:

(a) the latest developments in the evidence-base in relation to changing eating and physical activity behaviour;

(b) who are the most effective agents for the delivery of behaviour interventions to tackle obesity;

(c) how current behaviour change interventions tackle obesity and what use is made of available scientific evidence;

(d) whether such interventions are appropriately designed and evaluated; and

(e) what lessons have been learnt and applied as a result of the evaluation process.

The Committee would also be interested to hear about any other issues not already covered by this call for evidence that are relevant to the scope of the inquiry.

Case study 2: Travel-Mode choice interventions to reduce car use in towns and cities

Greenhouse gas emissions from transport represent 21% of the total United Kingdom domestic emissions. Emissions from private car use constitute 78% of that figure, representing 17% of total emissions or 91.5 million tonnes of CO_2 in 2008. Although technological measures are important in reducing emissions and may be effective in the long-term they are not sufficient to achieve the necessary reduction in carbon emissions in the short-term. Getting individuals to reduce the amount that they use their cars is necessary if the UK's carbon reduction targets are to be met successfully.

Behaviour change interventions to encourage people to travel more sustainably have become an integral part of transport policies in recent years, featuring in the previous Government's *Low Carbon Transport Strategy* of 2009. To date, however, such interventions do not appear to have led to a major change in transport mode choice, or a significant reduction in CO_2 emissions from transport.

The Committee invites evidence on the following questions

Questions

17. The Committee would welcome submissions on behaviour change interventions, whether in the public sector, the private sector or by voluntary organisations, designed to change travel-mode choice in order to reduce car use in towns and cities, in the United Kingdom or internationally, in order to examine:

(a) what are the most influential drivers of behaviour affecting an individual's choice of mode of travel;

(b) what is the role of infrastructure in encouraging and facilitating changes in travel-mode choice;

(c) what are the latest developments in the evidence-base in relation to changing travel-mode choice and the implications of those developments for policy;

(d) what are the most appropriate type and level of interventions to change travel-mode choice;

(e) who are the most effective agents for the delivery of behaviour interventions to change travel-mode choice;

(f) how do current behaviour change interventions seek to change travel-mode choice and what use is made of available scientific evidence;

(g) are current policy interventions addressing both psychological and environmental barriers to change;

(h) are policy interventions appropriately designed and evaluated;

(i) what lessons have been learnt and applied as a result of the evaluation of policy; and

(j) what lessons can be learnt from interventions employed in other countries.

The Committee would also be interested to receive evidence on the broader scope and questions outlined in the first call for evidence, where it is of relevance to this case study.

APPENDIX 4: SEMINAR ON BEHAVIOUR CHANGE INTERVENTIONS TO PREVENT AND TACKLE OBESITY HELD AT THE HOUSE OF LORDS

19 October 2010

Members of the Sub-Committee present were Lord Alderdice, Lord Crickhowell, Baroness Hilton of Eggardon, Lord Krebs, Baroness Neuberger (Chairman), Baroness O'Neill of Bengarve, Lord Patel, Baroness Perry of Southwark, the Earl of Selborne and Lord Warner. In attendance were Daisy Ricketts (Clerk) and Rachel Newton (Policy analyst).

The speakers were: Richard Cienciala (Obesity Team, Department of Health); Professor Ken Fox (Centre for Exercise, Nutrition and Health Sciences, University of Bristol); Dr Susan Jebb (Chair of the Cross Government Expert Advisory Group on Obesity and Head of Population Nutrition and Health, Medical Research Council Human Nutrition Research); Professor Mike Kelly (Director, Public Health Excellence Centre, National Institute for Clinical Excellence); Professor Susan Michie (Professor of Health Psychology, University College London).

Other participants were: Dr Mike Rayner (Director of the University of Oxford's Public Health and Primary Health Care Division); Dr Julie Waumsley (Chair of the Obesity Working Group, British Psychological Society).

An introduction to the causes of obesity and the role of behaviour change interventions to prevent and tackle obesity (Dr Susan Jebb)

Dr Jebb outlined the changes in the prevalence of obesity among children and adults since 1993; the rate of obesity had continued to increase in adults but had slowed and arguably begun to plateau in children. A number of serious health risks had been shown to arise from obesity.

The factors which cause obesity were numerous and interlinking; some related to the individual directly, and some arose from the environment. Physical activity and levels of food consumption were argued to be the two most important factors in causing obesity but were in part determined by biological factors and also impacted by an individual's psychology and environmental factors.

Evidence about treating obesity through individual level behaviour change interventions had been shown to be strong. Effective treatment options for obesity included bariatric surgery, pharmacotherapy, or diet and exercise interventions. Key elements of successful interventions included awareness and motivation to change, realistic goal-setting, confidence to succeed, improved dietary habits, increased physical activity and self-monitoring of behaviours. The major challenge however was to move beyond individual level interventions and drive behaviour change on a public health scale.

In relation to preventing obesity, there had been few examples of controlled interventions with detailed evaluation, and few were successful in attenuating weight gain. There was greater evidence about how to influence positively diet and activity behaviours but little data on the sustainability or cost-effectiveness of these interventions. Better evaluation of public health interventions was identified as a key area for improvement.

The theoretical base for obesity prevention suggested that changing dietary behaviour required initiatives to make products and the environment healthier alongside initiatives to change people's attitudes and motivation.

The Nuffield Ladder set out the range of public health interventions in increasing order of intrusiveness.[344] Specific evidence about effectiveness was lacking in relation to incentives and disincentives, including marketing practices.

An introduction to the National Institute for Clinical Excellence guidance on behaviour change and obesity (Professor Mike Kelly)

Professor Kelly summarised the key difficulties faced in creating the National Institute for health and Clinical Excellence's (NICE) obesity and behaviour change guidance. Causal relations between interventions and their outcome were distal, and trying to show cause and effect from complex interventions in complex settings was difficult. Data about interventions was compromised as a result of poor planning of the interventions and the lack of specificity about intended outcomes. Behavioural models were selectively applied without reference to the evidence, and causal links between interventions and outcomes were often not articulated. There was confusion about the level at which interventions and outcomes operated, and an absence of systematic evaluation of interventions.

The guidance noted that an intervention plan should be developed on knowledge of the target audience and take account of the socioeconomic and cultural context. The plan should be as specific as possible about the content of the behaviour to be changed and clarify which underlying theories made explicit the causal links between actions and outcomes.

Training should focus on generic competencies, such as critical evaluation of the evidence and the use of clear outcome measures. At an individual level people should be helped to develop accurate knowledge about the health consequences of their behaviour in order promote positive feelings toward the outcome of behaviour change. Interventions should enhance people's belief in their ability to change, help them to form plans and goals for changing behaviour over time, and enable them to develop skills to cope with difficult situations and conflicting goals. Social approval was an important element of successful interventions. Population level interventions should be consistent with those delivered to individuals and communities.

Better evaluation was an important part of the guidance. Where possible, the effectiveness, acceptability, feasibility, equity and safety of interventions should be evaluated using appropriate outcome measures. Funding applications and project plans for new interventions should include specific provision for their evaluation and monitoring.

Changing behaviour in relation to obesity: eating and physical activity (Professor Susan Michie)

Professor Michie outlined the factors which needed to be understood before behaviour could be successfully changed: the context, the nature of the behaviour, the range of interventions available, evidence-based techniques, and the identity of those who need to take action.

---

[344] *Public health: ethical issues*, Nuffield Council on Bioethics (2007)

Behaviour change had been shown to require simultaneous and consistent intervention at the individual, community and population level. Behaviour resulted from interactions between a person's psychological and physical capability, motivation, and physical and social opportunities. Interventions should address all three of these factors: capability, motivation and opportunity. Motivation encompassed the reflective (deliberative, systematic decision-making) and the automatic (emotion and habit-based) systems.

Arguably current Government proposals emphasised personal responsibility and choice over state regulation of commercial interests. This was based on the premise that behaviours that led to obesity were the result of the reflective rather than the automatic system, and underplayed the role of context, stimulus and emotion in driving people's behaviour. It was argued that this approach did not acknowledge the role of industry in influencing the automatic drivers of food consumption by a variety of subtle persuasive techniques. It was argued that, given the serious harm caused by obesity, the Government had a responsibility to counteract the methods of behavioural control employed by industry.

Evidence from systematic reviews and randomised controlled trials from a range of population groups, showed that weight loss was consistently associated with behaviour change techniques of self-monitoring, goal-setting and review, action planning, information provision, barrier identification and relapse prevention. The NHS Health Trainers Programme was identified as an example of an effective intervention which was based on good evidence. The programme was delivered by trained behaviour change specialists

Discussion

The role of the food industry in causing obesity, and the extent to which they would help tackle the problem, was discussed. The reduction in salt levels in food was given as an example of a successful voluntary change by industry. It was argued that encouraging industry to get their profits from healthy products would be a big challenge but that collaboration with industry would be necessary to achieve population level changes in dietary habits.

The need to improve evaluation was then discussed. Those who funded research should not provide money to projects unless evaluation was built in from the beginning. Involving people in evaluation was viewed as key; the Health Trainers programme was a good example of where this had been done well. It was proposed that extrapolating from other fields would make a broader range of evidence available; more studies should be done into the effectiveness of interventions rather than the aetiology of obesity, and there should be a greater focus on using logic to extrapolate conclusions rather than straightforward empiricism. Lessons learnt from unintended consequences of interventions should not be ignored.

It was noted that it could be difficult to learn lessons from interventions in other countries. For example, the government of Finland had done much to change eating and activity behaviour. The population of Finland however was small and homogenous; findings could therefore not easily be transferred to large culturally and individualistic populations, such as the United Kingdom's.

The question of whether genetic factors may have led to a plateau in prevalence of obesity was discussed. Against this conclusion was the fact that there were different levels of plateau in high and low-income groups, and in United Kingdom and the United States. Furthermore, studies have shown that if adults were

exposed to an environment in which they overate, they all gained weight; no individuals were resistant to weight gain.

The extent to which change achieved by programmes at an individual level could be seen to impact the behaviour of a population, in comparison to that achieved by changes to the macro context, was questioned. Road safety was identified as an area in which the changes to the macro environment successfully changed behaviour. Coronary heart diseases were reduced by individual and population level interventions. Interventions at both levels should be used and could be complementary.

Finally, the relationship between reflective cognitive and automatic processes was discussed. Cognition should be seen as important in treating obesity because the decision to eat less must be a conscious one to overcome the biological drive to eat to meet energy needs. It was argued that cognitive processes were less important in preventing obesity; many interventions at an associative non-cognitive, or automatic, level were effective in changing behaviour. The Government should seek to change behaviour at both a cognitive and an automatic level. It was argued that the Government has particular responsibility for the environment in which people make choices; there would be no point motivating somebody to exercise more if there was no safe space for them to do so.

Applications of behaviour change theory to physical activity interventions (Professor Ken Fox)

Professor Fox outlined the background and purpose of exercise psychology. Physical behaviour was closely related to an individual's self-esteem and self-perception; understanding the meaning and value of a behaviour to an individual enabled an understanding of their motivation. Self-perception and self-determination theories provided useful frameworks for strategies for physical activity interventions. The theories should be tailored for different target groups using pre-intervention qualitative research and social marketing principles.

The challenges in applying behaviour change theory to physical activity interventions included developing a menu of strategies derived from several theories; no one theory covered everything. Randomised controlled trials could be difficult to establish and did not always identify which parts of an intervention produce change. In many interventions robust measurement of outcomes was not achieved. A key element of physical activity interventions was the quality of the leader and good training of leaders was essential.

Examples of successfully delivered, evidence-based interventions included a randomised controlled trial to evaluate physical activity as a treatment for depression by the Universities of Bristol and Exeter, and a project to increase physical activity in older people.

Changes to the environment had been very difficult to get funded and had taken a long time to complete. This should however be viewed as a very important element in making it easier for people to increase their levels of physical activity.

An introduction to obesity policy for England (Mr Richard Cienciala)

Mr Cienciala noted that the new public health white paper would be published later in the year (December 2010),[345] and would provide more information on the

[345] *Healthy Lives, Healthy People*, DH (November 2010)

Government's approach; he outlined what was already known about that approach. It would be proposed that a new Public Health Service would be created, which would protect public health spending through ring-fenced budgets and weight allocations toward the most disadvantaged areas. It would be proposed that much action on public health would shift to a local level.

Business would have a key role to play alongside communities and local Government, as they could have a huge influence on people's diets and activity levels. The Government would create a new public health responsibility deal with businesses. A number of networks had already been set up on topics including food, physical activity, alcohol and behaviour change, through which businesses could develop and deliver a set of commitments.

The role of central government would be to lead on initiatives which were best done once and at a national level, such as national campaigns. Central government would also lead cross-Government effort and collaborations with businesses. They would ensure a strong focus on data and evaluation; the Government would continue to draw on expert analysis, NICE guidance and other academic literature, including considering the cost-effectiveness of existing interventions and initiatives. On obesity specifically, thinking in these areas was supported by an Expert Group which considered the strengths and weaknesses of the evidence-base, and emerging evidence for policy implications. The National Obesity Observatory had published a standard evaluation framework to support high quality, consistent evaluation of weight management interventions to increase the evidence-base.

Approaches to obesity were summarised as being likely to reflect four key areas: informing, educating and 'norming' behaviour; creating an enabling environment; supporting the provisions of effective services; and facilitating the sharing of best practice, data and evidence. There would be a strong interest on exploring how the latest in behavioural science could be applied and building on lessons learnt from current initiatives, such as Change4Life, the National Child Measurement Programme, the Convenience Stores Programme and Walk Once a Week.

Discussion

The relationship between public health and public goods was discussed. Reducing obesity should be seen as a public good but was argued to be a matter of health promotion rather than health protection.

The role of businesses was further discussed and scepticism was expressed about the willingness of the food industry to self regulate. The Government had been clear that the responsibility deal networks were an opportunity for businesses to collaborate with Government and make voluntary changes, but if they do not take this opportunity other means of achieving the same end would be considered. It was noted that the Government should be very specific about the changes that they would like industry to make.

The role of the environment in causing obesity was then discussed. Obesity could be considered the logical consequence of the environment; individuals have to make an effort not to be obese. This demonstrated the importance of infrastructure to support healthy behaviours, particularly in relation to physical activity. This was related to the fact that individuals tended to be more motivated to take the easy option; changing the environment could make healthy choices less difficult.

The connection between social norms and self-esteem was noted. An individual's understanding of their self should be understood partly as a reflection of society; where obesity was normal, people would be less motivated to lose weight. People should therefore be educated about the damaging effects of obesity.

The evidence for "nudges" was discussed. Scepticism was expressed about the evidence for "nudges" and the extent to which the concept was promoted for ideological reasons, rather than its practical usefulness. It was noted that piloting and evaluation of nudge techniques was very important to the Government. Nudges were not the only tool available to Government but should be seen as complementary to other approaches.

APPENDIX 5: SEMINAR ON BEHAVIOUR CHANGE AND TRAVEL BEHAVIOUR HELD AT THE HOUSE OF LORDS

26 January 2011

Members of the Sub-Committee present were Baroness Hilton of Eggardon, Lord Krebs, Lord May of Oxford, Baroness Neuberger (Chairman), Baroness O'Neill of Bengarve, Baroness Perry of Southwark and the Earl of Selborne. In attendance were Daisy Ricketts (Clerk) and Rachel Newton (Policy analyst).

The speakers were: Dr Jillian Anable, University of Aberdeen, Centre for Transport Research); Dr Sally Cairns (University College London and Senior Research Fellow of the Transport Research Laboratory); John Dowie (Director of the Regional and Local Transport Directorate, Department for Transport); Dr David Ogilvie (Medical Research Council Epidemiology Unit and UKCRC Centre for Diet and Activity Research, Cambridge); Dr Steve Skippon (Principle Scientist, Shell Global Solutions).

Other participants were: Professor Philip Goodwin (University of the West of England); Ms Carey Newson (Behaviour Change Specialist, Transport for Quality of Life).

An overview of current policies to change travel behaviours to reduce car use (Mr John Dowie)

Mr Dowie noted that available measures for changing travel behaviour included creating modal choices through improvements to public transport services and infrastructure, fiscal and regulatory measures, information provision and marketing. Historically, transport policy had been focused on infrastructure but there had been an increasing recognition that alternative persuasive techniques to change behaviour were also required. He noted that changes to infrastructure were not as effective in isolation as when combined with these sorts of techniques.

Past initiatives with the Department for Transport (DfT) had included small scale demonstration projects but the future policy direction was towards large scale, integrated policy packages. The Sustainable Travel Towns programme was introduced to test the potential of an integrated approach. It ran between 2004 and 2009 and was funded by £10 million of DfT funding together with £5 million of local funding. The towns of Darlington, Peterborough and Worcester were chosen after a competition; the three towns had varying socioeconomic contexts. The towns employed a range of measures, including personal travel planning, public transport information and marketing, travel awareness campaigns, cycling and walking promotions and car clubs. The results across all three towns showed a 9% reduction in car trips; a 10 to 22% increase in bus trips; a 26 to 30% increase in cycle trips; and a 10 to 13% increase in walking trips. The Cycle Demonstration Towns programme was conducted on the same basis; results demonstrated a 27% increase in cycling levels across the participating towns.

The Local Transport White Paper, *Creating Growth, Cutting Carbon*, published in January 2011,[346] placed localism at the heart of the transport agenda. The Paper recognised the need for behavioural change and used the Nuffield Ladder of Interventions to argue that the starting point should not be to restrict choice but to enable and encourage more healthy and sustainable choices. The Local

[346] *Public health: ethical issues*, *op. cit.*

Sustainable Travel Fund would provide £560 million to local authorities over four years to build on the previous successful Sustainable Travel Towns and Cycling Towns programmes.

The DfT was also developing policies on alternatives to travel to help reduce car use. These included promoting information and communications technology to reduce the need for travel and working across the public sector to promote alternatives to travel. Eco driving was also an area of policy interest.

Embedding learning from behavioural science within Government was an important concern. An in-house toolkit had been developed for policy makers in the DfT and knowledge about behaviour change was being shared with local authorities.

Discussion

The results from the Sustainable Travel Towns were discussed further. The percentage increase in cycling was from a low base. The evaluation was completed at a time when the programmes were still running and it was not yet clear whether the improvements would persist. For an investment of only £10 million however it was considered by some to be a successful programme and to have provided good value for money.

The meaning of the word "nudge", in the context of "nudging not nannying", was discussed. It was suggested that "nudge" ought to be interpreted narrowly to include only soft or light touch measures. It was suggested that ministers faced a dilemma because there was a broadly held view that harder measures were necessary in transport to lock in traffic reduction. Nudges would not be sufficient alone but needed to form part of a package of interventions. It was argued that the Sustainable Travel Towns demonstration showed that light touch interventions targeted to individuals were complementary to infrastructure changes.

The discrepancies between the levels of car use in the United Kingdom and in Continental Europe were discussed. Different levels of investment in interventions were identified as a key reason for this.

The role of behaviour change in delivering emissions reductions (Dr Steve Skippon)

Dr Skippon argued that the effects of carbon emissions were cumulative and that even modest delays in reducing emissions would result in a much higher likelihood of a global temperature rise. The projected trend across Europe was continued growth in light duty (cars, vans and motorbikes) kilometres travelled. Shell's transport emissions modelling suggested that, for the EU light duty sector, the best achievable reduction in carbon emissions as a result of technology alone could mean that by 2050 annual emissions would be reduced by 80%. However such reductions would not happen quickly enough to limit the accumulation of carbon in the atmosphere and so global temperature rises. Changes to travel behaviour would therefore be necessary in addition to technology change because they could be implemented early and so have an impact on cumulative emissions.

A number of ways in which to change behaviour to reduce emissions from car use were identified, including a reduction in journeys undertaken, travel mode choice, downsizing of vehicles, and adoption of fuel-efficient driving styles. Modelling showed that the changes in behaviour that could be achieved through voluntary measures, such as public awareness and information campaigns and travel planning, would have some impact on cumulative emissions, but not enough. Changes could also be brought about by strong measures, including measures to

encourage modal shift like parking restrictions, and higher taxes on larger vehicles. Modelling suggested that these strong measures would be more effective in limiting cumulative emissions than the voluntary measures. Behaviour change would not be sufficient in isolation however. The full range of technological options would also be required if transport's contribution to global targets was to be approached.

Dr Skippon provided examples of the potential impact of behaviour change interventions in the road transport sector in the United States. He stressed that it was hard to translate conclusions from interventions in the United States, as the opportunities for behaviour change were very different there. For example, many more people drove large cars and so vehicle downsizing could have more of an impact than in Europe.

An introduction to the factors that influence travel behaviours and the possible mechanisms and interventions to affect those behaviours (Dr Jillian Anable)

Dr Anable noted that the separation of behaviour and technology was not a useful polarisation. Travel behaviour was not just about mode choice but encompassed the sort of cars that were purchased, how they were driven and how much they were used. Carbon pathways analysis conducted by the DfT showed that distance of trips was an important consideration. Short trips (under 5 miles) accounted for 20% of carbon emission. The Sustainable Travel Towns project demonstrated that the largest proportion of total reduction in car use (in terms of distance driven) came from small changes to the longest trips, although the most significant changes in behaviour as a result of the programme was seen in short trips.

Recent studies suggested that car use had peaked and that the downward trend in the uptake of sustainable travel modes was starting to reverse. There was also a drop in the number of people who held a driving licence. The reasons for these patterns were not known, although it was noted that a recent survey by the RAC identified changing attitudes toward travel.

Behaviour change was identified as a two way process, which was more flexible and volatile than was usually understood: some people gave up driving and started to use public transport, and others stopped using transport and started to drive on a continuous basis. Each decision-making process needed to be targeted differently to achieve net movement in a sustainable direction.

There had been examples of successful behaviour change, including the Sustainable Travel Towns project, the London congestion charge, pedestrianisation and public transport investment. Behaviour change was shown to result from a combination of many different determinants, encompassing factors subjective and objective to the individual, and subjective and objective to the collective.

Interventions had traditionally been classified either as structural, or collective and motivational. Examples of structural interventions included fiscal measures, provisions of alternative modes of transport, regulatory interventions and land use planning. Examples of collective and motivational interventions included information provision and social marketing. All of these interventions should be considered to be behavioural.

Dr Anable explained the language of "smarter choices" which was used often in relation to travel interventions. It was commonly understood to include psychological techniques to influence behaviour through engaging with individuals, rather than infrastructure. Some of the policy lessons that had been

learnt through the use of smarter choices, including in the Sustainable Travel Towns programme, were: behaviour change was greater where service improvements were combined with marketing and promotion; marketing and information was rarely sufficient on its own; medium length and commuter trips offered the best opportunity in terms of car mileage savings; local context and partnerships were important; behaviour change needed to be locked-in to prevent rebound; and individual behaviour changes would be diluted by a lack of regional and national policy consistency.

The strengths of the evidence-base were identified as case studies, behavioural and psychological studies and econometric studies. The weaknesses were longitudinal studies, controlled design, action research, and understanding social practices and interpersonal influences.

Optimism about technology and pessimism about behaviour amongst policy makers was not based on good evidence. Policymakers were not using the evidence when they focused on the individual and the rational and when they emphasised the evaluation of the impacts of separate policy instruments.

Discussion

The availability of systematic reviews of the evidence about how to reduce car use was discussed. It was suggested that there was a large volume of material but few high quality methodological studies, such as randomised controlled trials. The necessity of randomised controlled trials was discussed. Some suggested that, while it is not always possible to use them, wherever possible controlled trials or other high quality methodologies should be employed. It was noted that it was not always appropriate to attempt to evaluate the different components of packages of interventions separately, since a range of measures was often necessary in order for any change in behaviour to be achieved.

The financial cost of car use was discussed. Perceived cost was considered to be more important than actual cost, and initiatives to shift the cost of car use so that it was less fixed and more directly correlated to distance travelled were discussed. It was noted that such initiatives would be difficult to introduce and that the losses to certain groups would be large.

The potential proportion of achievable change was discussed. Some suggested that change could only be sought on the margins, in around 5% of the population. Others disagreed, arguing that there was potential to change the behaviour of 30% of the population over a period of two to five years.

The impact of age on travel behaviour was discussed. It was noted that there was a real decline in car use amongst the elderly and young adults. Amongst the elderly, responses to stopping using cars varied widely depending on their expectations and capabilities. Young urban professionals were identified as a group who tended not to use cars, and this was considered to be a new trend. There was a high proportion of cycling among this group, particularly in London. Bicycle brands were becoming more expensive, which suggested that some people saw a bike as a status symbol in the same way that many people saw cars. It was not clear however how the behaviour of young urban professionals would change as they grew older.

An overview of the challenges of conducting effective evaluations for interventions designed to change travel behaviours (Dr Sally Cairns)

Dr Cairns outlined the key questions for an evaluation to consider: what has happened to travel behaviour; why have the changes occurred and to what extent

can they be attributed to the interventions; and, what are the wider implications of those changes. The example of the Sustainable Travel Towns programme was used to illustrate this.

Evaluating what happened in the Sustainable Travel Towns was achieved by comparing data from the towns with national trends. Town data included household travel surveys, surveys in schools and workplaces, and counts of vehicles, cyclists, pedestrians and bus passengers. National data used included the National Travel Survey (specific data for medium sized urban areas) and the National Road Estimates (urban roads data). The value of triangulation of data sources was emphasized.

The evaluation of why changes occurred in the Sustainable Travel Towns was informed by in-depth interviews with those delivering initiatives, local authority officials, bus companies, those responsible for data collection and other relevant organisations. Contextual data was also gathered on the towns, such as population changes and levels of employment in order to understand what else might have caused change. Some of this information in relation to bus use in Worcester was demonstrated in graphical form; the graph showed the changes in bus patronage relative to the implementation of different initiatives. It was noted that change had been achieved through a combination of improvements in services, discounted fares and promotional campaigns, and it was not possible to assess the effect that any one of those measures would have had in isolation. It was noted that no long term follow-up was being conducted in the Sustainable Travel Towns following the initial evaluation, but that this could be insightful.

The key lessons identified for future evaluation were that good practice usually included controls or benchmarking; triangulation of data sources; and understanding not only what had happened but the context in which it had happened. Full evaluation could give invaluable results but was likely to be complex, time consuming, expensive and not a precise science.

Travel behaviour interventions from a public health perspective (Dr David Ogilvie)

Dr Ogilvie provided an overview of the evidence for travel behaviour interventions from a public health perspective. It was often unrealistic to expect to be able to test the whole causal chain, from intervention to ultimate health improvement, within a single study. The benefits of physical activity for health were clearly established; the greater current challenge was evaluating the impact of interventions to change travel behaviour on overall levels of physical activity.

Outcome measures for travel behaviour and physical activity were not synonymous. Questionnaires were widely used for estimating physical activity and energy expenditure from the time or distance travelled, but the precision of these estimates could be improved by measuring behaviour more objectively using devices such as accelerometers, heart-rate monitors and Global Positioning System receivers.

It was suggested that randomised controlled trials could be applied to some interventions but not all. They were underused in travel interventions; personalised travel planning provided a good opportunity for controlled trials but they had not been used. Sometimes a ‘natural experiment’ approach was more appropriate, particularly for interventions such as charging schemes and infrastructure changes. The Medical Research Council was developing guidance on the evaluation of natural experimental studies.

The 2009 report from the House of Commons Health Committee on health inequalities was cited as providing a list of desirable qualities of a robust evaluation.[347] Among the most important of these was adjustment for the counterfactual; even if there were no external control group, other methods were available for estimating what might have happened without the intervention. Social distribution of effects was also identified as an important measure. Behaviours and their impacts were socially patterned and evaluations should seek to identify which groups in the population had experienced the benefits and harms of a given intervention.

Discussion

The impact of investment in infrastructure was discussed. It was noted that the Sustainable Travel Towns programme cost £10 per person per year. In Copenhagen £40 per person per year was invested in infrastructure and they had far lower rates of car use. It was suggested that investment was related to impact. Following the evaluation of the Sustainable Travel Towns, one estimate suggested an investment of £20 per person per year in "smarter choice" measures was needed. It was noted that road user charging does not cost money but rather creates revenue, though this is only one form of intervention, which may not be effective in isolation.

It was noted that not only do other European countries spend more but that they have been spending more consistently for longer. That had not happened in the United Kingdom; when something had been shown to work, it had often been stopped. It was suggested that there was a danger in comparing the United Kingdom to Europe, as levels of car use in Europe would not be matched quickly. There was considered to be large potential for change in the United Kingdom but change would take time.

[347] Health Committee, 3rd report (2008–09): *Health Inequalities* (HC Paper 286)

APPENDIX 6: ETHICS AND BEHAVIOUR CHANGE SEMINAR HELD AT THE HOUSE OF LORDS

10 February 2011

Members of the Sub-Committee present were Baroness Neuberger (Chairman), Baroness O'Neill of Bengarve, Lord Patel and the Earl of Selborne. In attendance were Daisy Ricketts (Clerk) and Rachel Newton (Policy analyst).

The speakers were: Professor Thomas Baldwin (Department of Philosophy, University of York); Professor Luc Bovens (Department of Philosophy, Logic and Scientific Method, London School of Economics); Professor Theresa Marteau (Professor of Health Psychology, Kings College London).

Other participants were: Professor Richard Ashcroft (School of Law, Queen Mary, University of London); Dr Bennett Foddy (Institute for Science and Ethics, University of Oxford); Dr Jessica Pykett (Institute of Geography and Earth Sciences Aberystwyth University).

An introduction to ethics in policy making (Professor Thomas Baldwin)

Professor Baldwin argued that it was a core value of liberal societies that citizens should be treated as rational agents, capable of taking responsibility for constructing their own lives. He outlined JS Mill's 'harm principle': the only reason that governments can exercise power against the will of an individual is to prevent harm to others. This principle would however limit the role of Government in public health to health protection and health promotion through the provision of advice (except where others might be harmed, as by smoking or failing to take steps to prevent the transmission of infectious or contagious diseases).

Professor Baldwin suggested that the example of obesity demonstrated that the 'harm principle' would not provide an adequate approach for Government intervention. He noted that obesity was not an infectious disease and that, although there had been much advice about healthy eating and exercise, rates of obesity continued to rise. He argued that the rise in obesity had not been caused by a collapse in personal responsibility but rather by changes in physical and social environment (as claimed in the Foresight report).[348] Tackling obesity was nevertheless a matter for Government because of its implications for the health of the population and the financial burden on public funds. Professor Baldwin suggested therefore that Government had a broad responsibility for the welfare of citizens that went beyond protecting them from harm from others. He further noted that the example of obesity highlighted the significance of equality; child obesity was correlated very closely with social deprivation.

The example of obesity linked three core aims for public policy: protecting personal responsibility, dealing with major challenges to public welfare, and promoting equality (at least equality of opportunity for health). The stewardship model proposed by the Nuffield Council on Bioethics (NCOB) illustrated how these values could work together: the Government's role was to act as 'steward' of the public environment in which individuals can exercise responsibility for their own choices. The NCOB proposed, in the light of this, that public policies should be seen as rungs of a ladder, with the bottom rungs representing minimal and less

348 *Tackling obesity: future choices*, *op. cit.*

controversial interventions, and higher rungs representing more intrusive intervention that require stronger justification.[349]

The NCOB recommended that governments should start at the bottom of the ladder and only move to policies higher up the ladder when a lower rung policy was not working; there was reason to think that a higher rung policy would be more effective; and when the goal of the policy was important enough to warrant more intrusive intervention. Professor Baldwin noted that the NCOB ladder had found its way into current Government policy, including the Public Health White Paper *Healthy Lives, Healthy People*.[350] It was used in this White Paper to justify avoiding the regulation of businesses, although the Nuffield Ladder was only intended to apply to policies directed at individuals.[351]

Intervening to change behaviour: factors influencing acceptability to members of the public (Professor Theresa Marteau)

As a psychologist, Professor Marteau outlined how what was known about human behaviour and evidence for the effectiveness of interventions, might bear on the judgments about the ethical acceptability of behaviour change.

Professor Marteau said that behaviour could be explained by dual process models of human behaviour, which distinguished between the reflective system and the impulsive system. The model represented the reflective system as driven by conscious decisions, taking into account considerations of the future and requiring a high cognitive capacity. It represented the impulsive system as driven by immediate perceptual input, giving no consideration to the future, operating quickly and requiring little or no conscious cognitive capacity. Professor Marteau said it was widely agreed that much behaviour was driven primarily by the automatic system, and was therefore closely linked to our environment, both physical and social. Professor Marteau outlined some experiments which demonstrated the impact of the physical environment on behaviour.

Professor Marteau argued that those who thought that behaviour was as driven primarily by the reflective system often took a negative attitude towards changing the physical environment to produce behaviour change. Conversely, those who thought that behaviour was primarily driven by the automatic system took a positive attitude towards intervening to change the environment, sometimes claiming that such interventions enabled individuals to behave as they really want to behave. Professor Marteau noted that most people mistakenly thought that the reflective system was most influential in causing behaviour. Psychologists referred to this misunderstanding as the 'fundamental misattribution error'.

Professor Marteau then discussed how evidence of effectiveness of interventions could affect public acceptability. She used the example of financial incentives for stopping smoking to demonstrate that though an intervention might initially be conceived negatively, public levels of acceptability might improve with evidence of effectiveness. Professor Marteau offered two examples of current policies to demonstrate that government's trade off the effectiveness of an intervention against other considerations. First, it was estimated that the current Government policy of placing a very low cost price minimum on alcohol would save 27 lives per year, whereas imposing a minimum cost of 40p per unit was estimated to save

[349] *Public health: ethical issues*, *op. cit.*

[350] *Healthy Lives, Healthy People*, *op. cit.*

[351] *Public health: ethical issues*, *op. cit.*

almost ten times as many lives. Secondly, a voluntary agreement on salt reduction in the United Kingdom achieved a reduction in average daily intake of 1g, saving 6000 lives per year by reducing cardio-vascular diseases, whereas regulation that reduced the average daily intake by 4g would, it was estimated, save 20000 lives per annum. Professor Marteau noted that these examples raised ethical question about the other factors which governments might consider more important than effectiveness, and the extent to which this affected the acceptability of an intervention.

Discussion: when, and how, is it appropriate for the Government to intervene to change people's behaviour?

The discussion began with consideration of whether governments could only restrict choice to prevent harm to others, or whether they could justifiably also intervene to prevent individuals harming themselves. It was noted that it was considered appropriate for government to intervene to restrict children's choices because they weren't considered to have full ability to make rational choices.

The implications of knowledge about the automatic and reflective system of behaviour for measures to restrict choice were discussed. First, it was noted that understanding behaviour demonstrated that people sometimes behave in ways which they do not really want (for example, 77% of smokers wanted to stop smoking and 70% of people who were obese wanted to lose weight). It was suggested that this might explain why some policies which were at first unpopular and considered unacceptably restrictive of choice, became accepted, indeed welcomed when effective. This could justify implementing unpopular policies; though a policy might initially restrict choice, it might then allow individuals to behave in the way they want to behave. Others noted that if governments assumed that they knew what people 'really' wanted better than the individuals themselves, this might be the start of a slippery slope and could be used to justify interventions which were not acceptable.

Secondly, some policies which restricted choice for some enabled choice for others. For example, restricting alcohol consumption through fiscal measures could restrict choice for some by making it more expensive to drink, but might enable choice for others who could walk home safely at night (assuming a reduction in crime and anti-social behaviour as a result of reduced alcohol consumption). Certain restrictions on individual choice limit population harm and could be justified on Millian and many other grounds. Alcohol, smoking and obesity also harm the population by their cost to the NHS and, in the case of alcohol, increased rates of crime. It could therefore be argued that tackling these problems did prevent harm to others, so fell within the meaning of the 'harm principle'.

The role of social norms was then discussed. It was suggested that understanding the impact of social norms entailed understanding automatic and reflective processes which determined behaviour. Science had not been able to explain how and why social norms were produced but they reflected views of what was acceptable. For example, socials norms of alcohol consumption made interventions in this policy area difficult. If it was understood how to create a culture in which nobody would boast of having been "legless" this would support, or provide an alternative to, health promotion measures restricting access to alcohol.

Discussion: what makes a policy intervention coercive and how is this related to the restriction of choice?

A problem found during the course of the inquiry was outlined: those opposed to the use of legislation and fiscal policies to change behaviour had often defended their position by arguing that such measures were coercive. They had moreover cited the Nuffield Ladder in support of this claim. It was noted that in the text of the Nuffield report there was no claim that the top of the ladder represented forms of coercion, only that it represented more powerful or intrusive interventions. They were however characterised as coercive in a box within the report.[352]

It was argued that a distinction should be drawn between policies which were coercive and those which required coercive backing. Even interventions at the bottom of the Nuffield Ladder might require coercive backing if introduced as a matter of public policy, for example if businesses were legally required to provide certain information on food packaging. It was noted that coercion was felt by many to be intrinsically bad but that legislation was not in and of itself coercive. If legislation was seen as coercive, then the rule of law was itself a form of coercion. The link between coercion and financial incentives to change health behaviour was also discussed. It was noted that though the media sometimes described incentives as a form of coercion or bribery, it was very difficult to "pin the coercive tail to the incentive donkey".

The Ladder was intended as a mechanism for thinking about issues of acceptability in the first instance; it was not meant to be the last word on policy justification. It was suggested that the Ladder was being asked to do more than it was capable of doing by policy makers, particularly in the Public Health White Paper *Healthy People, Healthy Lives*.[353] Though the Ladder was useful, it only had one dimension, and so did not reflect the complexity of policy interventions. For example, providing information was at the bottom of the Ladder but the provision of information could be legally required, and the requirement would have the same coercive backing as other legislation.

Freedom of choice was discussed. It was suggested that the Nuffield Ladder had been used by policy makers because it fitted in with a politically "popular choice agenda". It was noted that there was a wide range of understandings about what sorts of choice should be protected. These included: freedom to make equal choices, freedom to choose as we like, equal freedom to choose as we like, or freedom as non-domination by others. There were problems with all of these understandings of freedom, but the conception of freedom as non-domination by others should be given particular consideration.

Ethics and "Nudge" (Professor Luc Bovens)

Professor Bovens first defined the concept of nudging, citing four criteria that made an intervention a nudge: the intervention must not restrict choice; it must be in the interests of the person being nudged; it should involve a change in the architecture or environment of the choice; it should exploit a mechanism of less than fully deliberative choice. These were relevant to judging what make a nudge permissible.

Professor Bovens noted that most people's immediate reaction to nudging was to think that they were being manipulated. He discussed the differences between

---

[352] *Ibid.*

[353] *Healthy Lives, Healthy People, op. cit.*

subliminal advertising and nudging. He noted that there were two sorts of transparency; transparency could mean that people were told about an intervention or it could mean that people were able to discern for themselves that an intervention had been implemented. In the case of subliminal messaging, the first sort of transparency makes no difference to whether the messaging is manipulative. Similarly, for some interventions, such as placing health food first in a cafeteria, the first sort of transparency might prevent it from working as well. The second sort of transparency, that a perceptive person should be able to discern the intervention, was considered the most important sort.

Professor Bovens highlighted four other facts which should be considered when thinking about the ethics of nudging: the urgency of the problem to be solved; the cost of the intervention for responsible agents (not only financial cost but the cost, for example, of restriction of choice or intrusiveness); the extent to which the nudge is in the interests of the person being nudged; the identity of the organisation doing the nudging.

Discussion: are nudges ethically acceptable?

The extent to which businesses nudge people was considered. It was noted that experiments showed that food adverts influenced people's behaviour in ways that they were not aware of. Adverts exploited the same mechanisms but advertising was not generally considered unethical, unless it was deceptive or inappropriately targeted, for example, at children.

The justifiability of governments intervening to change social norms was discussed. It was suggested that many people would not be happy for government to seek to change the culture of society. Others argued that it was legitimate for the government to look at social norms which were already changing, as in the case of binge drinking.

In conclusion, it was agreed that thinking about choice was very difficult and there was a tendency to fall back on the 'harm principle'. The problem however was that governments would not be able to protect all choices and so they must decide which were most important. Thinking about choice was complicated by different conceptions of autonomy, particularly given the distinction between automatic and reflective choices. The extent to which autonomy should include both automatic and reflective choices was considered. How autonomy was conceived would have a direct impact on the acceptability of nudging, which sought to influence automatic choices. The concepts of informed and fully informed choices were then discussed. It was argued that there was often hypocrisy in public policy, particularly medical ethics, about whether only informed choices should be protected. It was agreed that governments should think very carefully about what they what they meant if they said that an intervention would restrict choice.

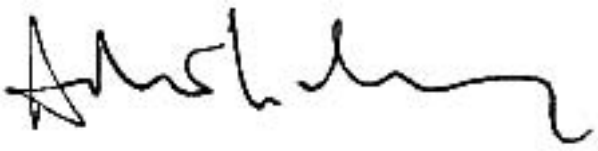
Foreword

This White Paper outlines a radical shift in the way we tackle public health challenges. We have to be bold because so many of the lifestyle-driven health problems we see today are already at alarming levels.

Britain is now the most obese nation in Europe. We have among the worst rates of sexually transmitted infections recorded, a relatively large population of problem drug users and rising levels of harm from alcohol. Smoking alone claims over 80,000 lives every year. Experts estimate that tackling poor mental health could reduce our overall disease burden by nearly a quarter. Health inequalities between rich and poor have been getting progressively worse. We still live in a country where the wealthy can expect to live longer than the poor.



The dilemma for government is this: it is simply not possible to promote healthier lifestyles through Whitehall diktat and nannying about the way people should live. Recent years have proved that one-size-fits-all solutions are no good when public health challenges vary from one neighbourhood to the next. But we cannot sit back while, in spite of all this, so many people are suffering such severe lifestyle-driven ill health and such acute health inequalities.

We need a new approach that empowers individuals to make healthy choices and gives communities the tools to address their own, particular needs. The plans set out in this White Paper put local communities at the heart of public health. We will end central control and give local government the freedom, responsibility and funding to innovate and develop their own ways of improving public health in their area. There will be real financial incentives to reward their progress on improving health and reducing health inequalities, and greater transparency so people can see the results they achieve.

We are simplifying the way we organise things nationally, too, with a dedicated new public health service – Public Health England – taking the place of the complex structures that exist today. The new dedicated service will support local innovation, help provide disease control and protection and spread information on the latest innovations from around the world.

All this will be supported by work with industry and other partners to promote healthy living. New practices and technologies are already revolutionising efforts to prevent sickness and improve health and well-being – from partnerships between the voluntary sector and employers to incentivise people to be more active, to new phone apps that help people lose weight. If we can direct the collective power of this diverse innovation towards a single national purpose, we believe we can make real progress.

The result of all this will be a much more innovative, integrated and dynamic approach to improving public health. Under our plans local innovation will replace central control. People and communities will drive directly the change we need to build a stronger, healthier Britain.

Secretary of State for Health

Executive Summary: Our strategy for public health in England

1. This is a new era for public health, with a higher priority and dedicated resources. This White Paper outlines our commitment to protecting the population from serious health threats; helping people live longer, healthier and more fulfilling lives; and improving the health of the poorest, fastest.

2. It responds to Professor Sir Michael Marmot's *Fair Society, Healthy Lives*[1] report and adopts its life course framework for tackling the wider social determinants of health. The new approach will aim to build people's self-esteem, confidence and resilience right from infancy – with stronger support for early years. It complements *A Vision for Adult Social Care: Capable Communities and Active Citizens*[2] in emphasising more personalised, preventive services that are focused on delivering the best outcomes for citizens and that help to build the Big Society.

3. The goal is a public health service that achieves excellent results, unleashing innovation and liberating professional leadership. This White Paper builds on *Equity and Excellence: Liberating the NHS*[3] to set out the overall principles and framework for making this happen.

4. Subject to Parliament, local government and local communities will be at the heart of improving health and wellbeing for their populations and tackling inequalities. A new integrated public health service – Public Health England – will be created to ensure excellence, expertise and responsiveness, particularly on health protection, where a national response is vital.

5. During 2011, the Department of Health will publish documents that build on this new approach, including on mental health, tobacco control, obesity, sexual health, pandemic flu preparedness, health protection and emergency preparedness, together with documents from other government departments addressing many of the wider determinants of health.

6. The proposals in this White Paper apply to England, but we will work closely with the Devolved Administrations on areas of shared interest.

Seizing opportunities for better health

7. Public health has formidable achievements to its name: clean air and water, enhanced nutrition and mass immunisation have consigned many killer diseases to the history books. There are huge opportunities to go further and faster in tackling today's causes of premature death and illness. People living in the poorest areas will, on average, die 7 years earlier than people living in richer areas and spend up to 17 more years living with poor health. They have higher rates of mental illness; of harm from alcohol, drugs and smoking; and of childhood emotional and behavioural problems. Although infectious diseases now account for only 1 in 50 deaths, rates of tuberculosis and sexually transmitted infections (STIs) are rising and pandemic flu is still a threat.

8. A fuller story on the health of England is set out in *Our Health and Wellbeing Today*, published to accompany this White Paper. The opportunity – and the challenge – is stark, for example:

   a. By improving maternal health, we could give our children a better start in life, reduce infant mortality and the numbers of low birth-weight babies.

   b. Taking better care of our children's health and development could improve educational attainment and reduce the risks of mental illness, unhealthy lifestyles, road deaths and hospital admissions due to tooth decay.

   c. Being in work leads to better physical and mental health, and we could save the UK up to £100 billion a year by reducing working-age ill health.[4]

   d. Changing adults' behaviour could reduce premature death, illness and costs to society, avoiding a substantial proportion of cancers, vascular dementias and over 30% of circulatory diseases; saving the NHS the £2.7 billion cost of alcohol abuse; and saving society the £13.9 billion a year spent on tackling drug-fuelled crime.

   e. We could prevent many of the yearly excess winter deaths – 35,000 in 2008/09 – through warmer housing, and prevent further deaths through full take-up of seasonal flu vaccinations.

A radical new approach

9. The current approach and system is not up to the task of seizing these huge opportunities for better health and reduced inequalities in health. This White Paper sets out a radical new approach that will empower local communities, enable professional freedoms and unleash new ideas based on the evidence of what works, while ensuring that the country remains resilient to and mitigates against current and future health threats. It sets out how our approach will:

    a. protect the population from health threats – led by central government, with a strong system to the frontline;

    b. empower local leadership and encourage wide responsibility across society to improve everyone's health and wellbeing, and tackle the wider factors that influence it;

    c. focus on key outcomes, doing what works to deliver them, with transparency of outcomes to enable accountability through a proposed new public health outcomes framework;

    d. reflect the Government's core values of freedom, fairness and responsibility by strengthening self-esteem, confidence and personal responsibility; positively promoting healthy behaviours and lifestyles; and adapting the environment to make healthy choices easier; and

    e. balance the freedoms of individuals and organisations with the need to avoid harm to others, use a 'ladder' of interventions to determine the least intrusive approach necessary to achieve the desired effect and aim to make voluntary approaches work before resorting to regulation.

10. This approach will: **reach across and reach out** – addressing the root causes of poor health and wellbeing, reaching out to the individuals and families who need the most support – and be:

    - **responsive** – owned by communities and shaped by their needs;
    - **resourced** – with ring-fenced funding and incentives to improve;
    - **rigorous** – professionally-led, focused on evidence, efficient and effective; and
    - **resilient** – strengthening protection against current and future threats to health.

Health and wellbeing throughout life

11. The Government is radically shifting power to local communities, enabling them to improve health throughout people's lives, reduce inequalities and focus on the needs of the local population. This White Paper highlights local innovation and outlines the cross-government framework that will enable local communities to reduce inequalities and improve health at key stages in people's lives, including:

    a. empowering local government and communities, which will have new resources, rights and powers to shape their environments and tackle local problems;

    b. taking a coherent approach to different stages of life and key transitions instead of tackling individual risk factors in isolation. Mental health will be a key element, and we will shortly publish a new mental health strategy;

    c. giving every child in every community the best start in life. We will do this through our continued commitment to reduce child poverty, by investing to increase health visitor numbers, doubling by 2015 the number of families reached through the Family Nurse Partnership programme, and refocusing Sure Start Children's Centres for those who need them most. An Olympic and Paralympic-style sports competition will be offered to all schools from 2012;

    d. making it pay to work through our comprehensive welfare reforms, creating new jobs through local growth and working with employers to unleash their potential as champions of public health;

    e. designing communities for active ageing and sustainability. We will make active ageing the norm rather than the exception, for example by building more Lifetime Homes, protecting green spaces and launching physical activity initiatives, including a £135 million Lottery investment in a Mass Participation and Community Sport legacy programme. We will protect and promote community ownership of green spaces and improve access to land so that people can grow their own food; and

    f. working collaboratively with business and the voluntary sector through the Public Health Responsibility Deal with five networks on food, alcohol, physical activity, health at work and behaviour change. We plan to launch the Deal in early 2011 and expect to be able to announce agreements on further reformulation of food to reduce salt; better information for consumers about food; and promotion of more socially responsible retailing and consumption of alcohol. It will also develop the Change4Life campaign, for example through the 'Great Swapathon', £250 million of partner-funded vouchers to make healthy lifestyle choices easier.

A new public health system with strong local and national leadership

12. To support this new approach and avoid the problems of the past, we need to reform the public health system. Localism will be at the heart of this system, with responsibilities, freedoms and funding devolved wherever possible; enhanced central powers will be taken where absolutely necessary, for example in areas such as emergency preparedness and health protection. Within this system:

    a. Directors of Public Health will be the strategic leaders for public health and health inequalities in local communities, working in partnership with the local NHS and across the public, private and voluntary sectors. The Government will shortly publish a response to the recent consultation on proposed new local statutory health and wellbeing boards to support collaboration across the NHS and local authorities in order to meet communities' needs as effectively as possible.

    b. A new, dedicated, professional public health service – Public Health England – will be set up as part of the Department of Health, which will strengthen the national response on emergency preparedness and health protection.

    c. There will be ring-fenced public health funding from within the overall NHS budget to ensure that it is not squeezed by other pressures, for example NHS finances, although this will still be subject to the running-cost reductions and efficiency gains that will be required across the system. Early estimates suggest that current spend on areas that are likely to be the responsibility of Public Health England could be over £4 billion.

    d. There will be ring-fenced budgets for upper-tier and unitary local authorities and a new health premium to reward them for progress made against elements of the proposed public health outcomes framework, taking into account health inequalities.

    e. The core elements of the new system will be set out in the forthcoming Health and Social Care Bill and will therefore be subject to Parliament's approval.

    f. The best evidence and evaluation will be used, supporting innovative approaches to behaviour change – with a new National Institute for Health Research (NIHR) School for Public Health Research and a Policy Research Unit on Behaviour and Health. There will be greater transparency, with data on health outcomes published nationally and locally.

    g. The Chief Medical Officer will have a central role in providing independent advice to the Secretary of State for Health and the Government on the population's health. He or she will be the leading advocate for public health within, across and beyond government, and will lead a professional network for all those responsible for commissioning or providing public health.

h. Public health will be part of the NHS Commissioning Board's (NHSCB) mandate, with public health support for NHS commissioning nationally and locally. There will be stronger incentives for GPs so that they play an active role in public health.

Making it happen

13. We are implementing our strategy to make early and substantial progress, so that we make a real difference to health from the earliest opportunity. Subject to the passage of the Health and Social Care Bill, the Government plans to:

    a. enable the creation of Public Health England, which will take on full responsibilities from 2012, including the formal transfer of functions and powers from the Health Protection Agency (HPA) and the National Treatment Agency for Substance Misuse (NTA);

    b. transfer local health improvement functions to local government, with ring-fenced funding allocated to local government from April 2013; and

    c. give local government new functions to increase local accountability and support integration and partnership working across social care, the NHS and public health.

14. The transition to Public Health England will be developed in alignment with changes to Primary Care Trusts (PCTs) and Strategic Health Authorities (SHAs), and the creation of the NHSCB. The detailed arrangements will be set out in a series of planning letters throughout the course of 2011.

15. To get the details of the new system right and ensure that it delivers significant improvements to the health of the population, we will be consulting on some elements. A number of consultation questions are set out in Chapter 4 and summarised in Chapter 5 of this White Paper, and we would welcome your views. The consultation on these questions closes on 8 March 2011.

16. The Department of Health has published a review of the regulation of public health professionals by Dr Gabriel Scally. A consultation question about this is in Chapter 4 of this White Paper. We would welcome views on this report.

17. Forthcoming consultation documents will set out the proposed public health outcomes framework, and funding and commissioning arrangements for public health.

1. Seizing opportunities for better health

Summary

Public health has formidable achievements to its name: clean air and water, enhanced nutrition and mass immunisation have consigned many killer diseases to the history books. There are huge opportunities to go further and faster in tackling today's causes of premature death and illness. People living in the poorest areas will, on average, die 7 years earlier than people living in richer areas and spend up to 17 more years living with poor health. They have higher rates of mental illness; of harm from alcohol, drugs and smoking; and of childhood emotional and behavioural problems. Although infectious diseases now account for only 1 in 50 deaths, rates of tuberculosis and sexually transmitted infections (STIs) are rising and pandemic flu is still a threat.

A fuller story on the health of England is set out in *Our Health and Wellbeing Today*, published to accompany this White Paper. The opportunity – and the challenge – is stark, for example:

- **By improving maternal health, we could give our children a better start in life, reduce infant mortality and the numbers of low birth-weight babies.**
- **Taking better care of our children's health and development could improve educational attainment and reduce the risks of mental illness, unhealthy lifestyles, road deaths and hospital admissions due to tooth decay.**
- **Being in work leads to better physical and mental health, and we could save the UK up to £100 billion a year by reducing working-age ill health.[5]**
- **Changing adults' behaviour could reduce premature death, illness and costs to society, avoiding a substantial proportion of cancers, vascular dementias and over 30% of circulatory diseases; saving the NHS the £2.7 billion cost of alcohol abuse; and saving £13.9 billion a year, the societal cost related to drug-fuelled crime.**
- **We could prevent many of the yearly excess winter deaths – 35,000 in 2008/09 – through warmer housing, and prevent further deaths through full take-up of seasonal flu vaccinations.**

Our health and wellbeing today

1.1 Today, people in England are healthier and are living longer than ever before, and have levels of wellbeing that are as good as those in other European countries. Most of the major advances in life expectancy over the last two centuries came from public health rather than healthcare. Public health innovations have included the establishment of clean water and sewage systems that radically reduced infectious diseases; clean air acts that curbed the pollution that killed thousands into the early 1950s; enhanced nutrition that has largely eliminated many birth defects and once common conditions such as rickets; and mass immunisation programmes that have consigned to the history books the infectious diseases that once dominated death certificates.

What is public health?

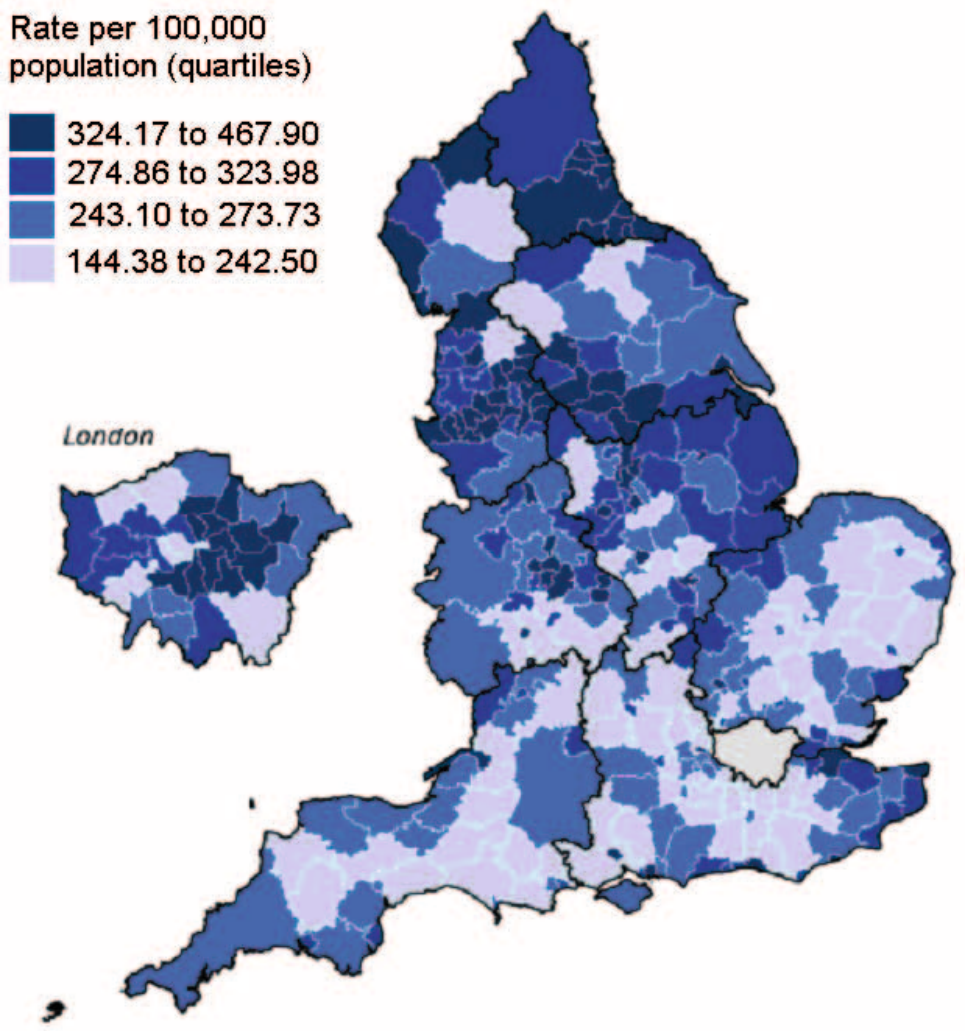
The Faculty of Public Health defines public health as: The science and art of promoting and protecting health and wellbeing, preventing ill health and prolonging life through the organised efforts of society.

There are three domains of public health: health improvement (including people's lifestyles as well as inequalities in health and the wider social influences of health), health protection (including infectious diseases, environmental hazards and emergency preparedness) and health services (including service planning, efficiency, audit and evaluation).[6]

1.2 Infectious diseases now account for only 1 in 50 deaths.[7] However, tuberculosis and STIs are rising, and pandemic flu remains a threat. We expect more people to have long-standing illnesses in future, and common mental health disorders are on the rise. Our causes of premature death are dominated by 'diseases of lifestyle', where smoking, unhealthy diet, excess alcohol consumption and sedentary lifestyles are contributory factors.

1.3 Health inequalities in life expectancy and disability-free life expectancy are large. We know that a wide range of factors affect people's health throughout their life and drive inequalities such as early years care, housing and social isolation. Despite this, our health efforts focus much more on treatment than on the causes of poor health. The NHS spends over £2.7 billion a year on treating smoking-related illness,[8] but less than £150 million on smoking cessation.[9] The Government

will work to re-balance the focus on the causes of ill health and ensure that public health funding is prioritised and not squeezed by other pressures, for example NHS finances, though it will still be subject to the running-cost reductions and efficiency gains that will be required across the system.



1.4 The contrast between what we know about the causes of premature death and illness in our society and the domination of our attention and spending on secondary care represents a profound challenge to our policy and our society as a whole. At a population level, it is not better treatment, but prevention – both primary and secondary, including tackling the wider social factors that influence health – which is likely to deliver greater overall increases in healthy life expectancy.

1.5 In order to meet this challenge, we need to think in more integrated and innovative ways about how we can empower people and communities to make healthier choices in their lives. We need to focus efforts across society on these big opportunities. This is potentially one of the great challenges of our generation – how we can create a public health service, not just a national sickness service.

How healthy and well are we overall?

1.6 People in England are healthier and are living longer than ever. Overall, we enjoy safe air and water, and are well protected from environmental hazards. We also have systems in place to prepare for and respond to new threats such as pandemic flu. However, there are substantial inequalities in health across the country – as there are in other wealthy countries. Figure 1.1 illustrates the variation in mortality of people under 75 in England; further analysis of public health data shows that different areas face different challenges (for instance, the patterns in smoking-related deaths are not the same as those in alcohol-related deaths, which are again different from those in excess winter deaths).[10]

Figure 1.1: Mortality from all causes, persons aged under 75, 2006–08, by local authority
(directly age-standardised mortality)

Source: National Centre for Health Outcomes Development, Compendium of Clinical and Health Indicators.

1.7 Today, English men can expect to live until 78 – longer than in most other comparable nations; however, still not as long as English women, who can expect to live to 82.[11] Life expectancy is expected to continue to rise for both men and women, rising to 81 and 85 years of age respectively by 2020.[12]

1.8 However, many people are still dying at a relatively young age, with more than 1 in 6 deaths occurring before age 65 in 2007.[13] The leading causes of death across all ages are circulatory diseases, cancers and respiratory diseases, which together accounted for 75% of deaths in 2007.[14]

1.9 We know that people suffer a substantial burden of ill health from living with conditions that give them pain, affect their mental health, or prevent them from doing their usual activities, making them dependent on the care of others. The good news is that although we are living longer, there is no strong evidence that the burden of health conditions has increased. Overall, reporting of longstanding illnesses has been stable for 30 years at around 30% of the population[15] and there is evidence that severity has actually lessened. Musculoskeletal conditions, circulatory diseases and mental health disorders account for over 70% of the burden of longstanding ill health.[16]

1.10 Some 15.4 million people in England have a longstanding illness,[17] and this is set to rise. Many of the diseases we now suffer from are linked to lifestyle and ageing. The numbers of people smoking, taking illicit drugs and drinking harmful levels of alcohol have all declined in recent years, but many of us still lead harmful lifestyles.

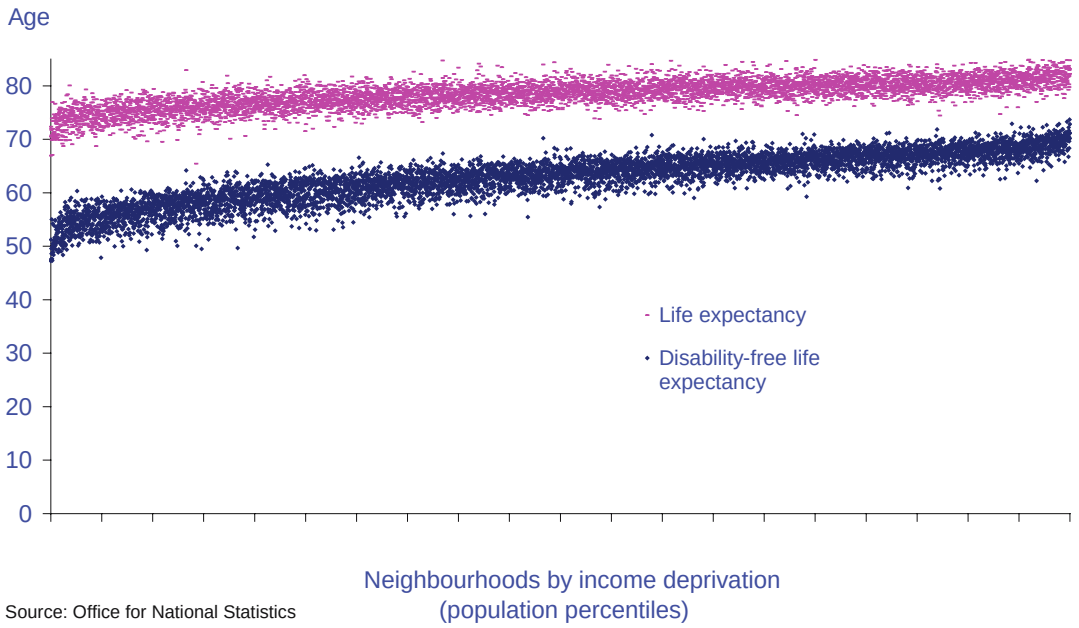
1.11 Wellbeing – a positive physical, social and mental state – is an important part of our health. Good wellbeing does not just mean the absence of mental illness – it brings a wide range of benefits, including reduced health risk behaviour (such as smoking), reduced mortality, improved educational outcomes and increased productivity at work. The data we have on wellbeing suggests that the UK is broadly on a par with France and Germany,[18] but there are likely to be wide variations within this across the country.

Wider factors influencing health, wellbeing and health inequalities

1.12 Our health and wellbeing is influenced by a wide range of factors – social, cultural, economic, psychological and environmental – across our lives. These change as we progress through the key transition points in life – from infancy and childhood, through our teenage years, to adulthood, working life, retirement and the end of life. Even before conception and through pregnancy, social, biological and genetic factors accumulate to influence the health of the baby.

Health inequalities – the evidence

Fair Society, Healthy Lives (2010),[19] the independent review of health inequalities in England commissioned by government and undertaken by Professor Sir Michael Marmot of University College London, sets out the implications of health inequalities. It makes it clear that material circumstance, social environment, psychosocial factors, behaviours and biological factors are all important influences on health. In practice, this means that in order to tackle health inequalities, we need to consider the much broader context of our lives. For instance, helping people into work can be very good for health. It provides not only income, but also – importantly – a stake in society. Early child development and educational attainment are also crucial for future health and wellbeing, as well as improving job opportunities and providing a route out of poverty.



While on the whole we are living longer than ever before, people's health and wellbeing varies significantly across England. And there is a social gradient of health – the lower a person's social position, the worse his or her health. People in disadvantaged areas are more likely to have shorter life expectancy and experience a greater burden of ill health – and there are differences in life expectancy and expectancy of life in good health across the socioeconomic spectrum. This inequality is driven by the underlying social factors that affect people's health and wellbeing – 'the causes of the causes'.

The Marmot Review states there are gaps of up to 7 years in life expectancy between the richest and poorest neighbourhoods, and up to 17 years in disability-free life expectancy (see Figure 1.2). It also highlights wide variation within areas; for instance in London, in one ward in Kensington and Chelsea, a man now has a life expectancy of 88 years, compared with 71 years in Tottenham Green, one of the capital's poorer wards. Low income and deprivation are particularly associated with higher levels of obesity, smoking, mental illness and harms arising from drug and alcohol misuse.

Protected equality characteristics can also have an impact on health. Evidence shows that inequalities based on race, disability, age, religion or belief, gender, sexual orientation and gender identity can interact in complex ways with socioeconomic position in shaping people's health. Some vulnerable groups and communities, for example people with learning disabilities or travellers, have significantly poorer life expectancy than would be expected based on their socioeconomic status alone.[20, 21]

1.13 We are all strongly influenced by the people around us, our families, the communities we live in and social norms. Our social and cognitive development, self-esteem, confidence, personal resilience and wellbeing are affected by a wide range of influences throughout life, such as the environment we live in, the place in which we work and our local community. This impacts on our health and our life chances.

Source: Office for National Statistics

Healthcare services have been estimated to contribute only a third of the improvements we could make in life expectancy – changing people's lifestyles and removing health inequalities contribute the remaining two thirds. Many of the biggest future threats to health, such as diabetes and obesity, are related to public health.[22]

1.14 Figure 1.3 shows how location, take-up of healthcare services (in this case primary care) and deprivation play a role in outcomes for coronary heart disease sufferers in Birmingham – where there is a relationship between mortality and failure to register with a GP and thus receive treatment.

Figure 1.3: Variation in Birmingham – showing stark differences between the location of coronary heart disease patients registered with GPs (a), and the locations where coronary heart disease mortality rates are highest (b)

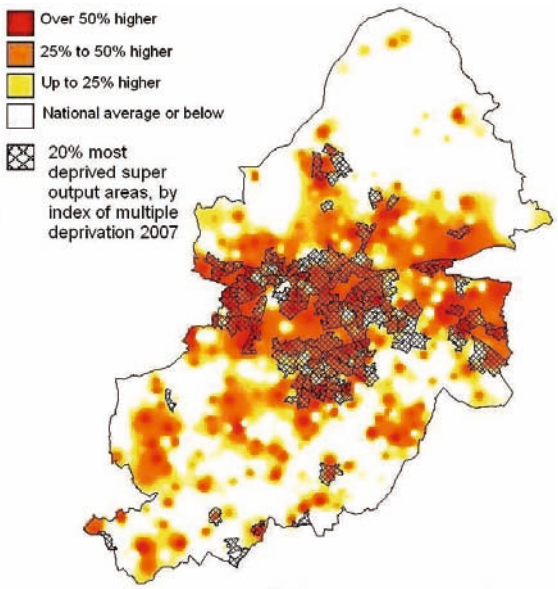

Figure 1.3a: Prevalence of coronary heart disease in Birmingham in 2008/09, according to GP Quality and Outcomes Framework data. Deprivation is also shown.

Figure 1.3b: Mortality from coronary heart disease in Birmingham in 2007-2009, according to data from the Office for National Statistics. Deprivation is also shown.

1.15 Recent research has shown that social networks exert a powerful influence on individual behaviour, affecting our weight, smoking habits and happiness.[23] Even people we do not know directly can affect our health and wellbeing.[24]

1.16 The quality of the environment around us also affects any community. Pollution, air quality, noise, the availability of green and open spaces, transport, housing, access to good-quality food and social isolation all influence the health and wellbeing of the local population. Climate change represents a challenge in terms of long-term health services planning and emergency preparedness.

Health and wellbeing challenges through life

Starting well

1.17 The health and wellbeing of women before, during and after pregnancy is a critical factor in giving children a healthy start in life and laying the groundwork for good health and wellbeing in later life.

1.18 Improving maternal mental health could lead to better outcomes in childhood. Maternal depression and anxiety in pregnancy and during a child's early life affects about 10–15% of pregnant women.[25] Rates are nearly twice as high among mothers living in poverty and three times as high for teenage mothers, and are associated with low birth weight, emotional or conduct disorders and children's later intellectual development.[26]

In one study, the children of women who were depressed at 3 months after giving birth had significantly lower IQ scores at 11 years. They also had problems with attention, had difficulties in mathematical reasoning, and were more likely than other children to have special educational needs.[27]

1.19 There has been substantial progress in reducing infant deaths. In 2008, the infant mortality rate was the lowest ever recorded in England, with fewer than 5 deaths per 1,000 live births in England compared with 18 deaths per 1,000 live births in 1970.[28] However, these rates are higher than in comparable European countries and infant mortality is a key indicator of wider health inequalities. There is a 70% gap in infant mortality between the richest and poorest groups, and rates for some ethnic groups are almost twice the national average.[29]

1.20 There are opportunities to reduce infant mortality further by tackling maternal obesity (around 1 in 5 mothers could be overweight or obese);[30] increasing breastfeeding rates (England has one of the lowest rates in Europe and the current prevalence of breastfeeding at 6-8 weeks is 46.2%[31]) and decreasing smoking in pregnancy (more than 1 in 6 mothers smoke during pregnancy[32]). Smoking rates during pregnancy are much higher among lower socioeconomic groups[33] and teenage mothers.[34]

1.21 A total of 1 in 14 babies in the UK have a low birth weight (which is associated with immediate and longer-term health consequences for babies), a higher rate than the average for EU15 and EU27 countries.[35] This could also be improved by reducing smoking during pregnancy.[36]

1.22 Children's development is crucial for their future health and wellbeing and better early years support could make a big difference. Good parent–child relationships help build children's self-esteem and confidence and reduce the risk of children adopting unhealthy lifestyles. A total of 1 in 10 children are estimated to have emotional or behavioural problems,[37] which increase the risk of poor health and wellbeing both in childhood and later life.[38]

At birth, babies have around a quarter of the brain neurons of an adult. By the age of 3, the young child has around twice the number of neurons of an adult – making the early years critical for the development of the brain, language, social, emotional and motor skills.

Developing well

1.23 There are opportunities to reduce road accidents – the leading cause of accidental death and injury of children in the UK, resulting in almost 21,000 injuries in 2009.[39] There are strong social and regional variations, so this lends itself to a tailored local approach.

1.24 Progress is being made in tackling childhood obesity – the rise among 2–10-year-olds from 1 in 10 children in 1995 to almost 1 in 7 in 2008 appears to be levelling off.[40] However, more than 1 in 5 children are still overweight or obese by age 3.[41] Rates are higher among some black and minority ethnic (BME) communities and in lower socioeconomic groups.[42]

Through social networks, obesity can actually be 'spread' by person-to-person interaction. Social norms affect other health areas too: if more than half of a student's social network smoke, then that student's risk of smoking doubles.[43]

1.25 Teenagers and young people are among the biggest lifestyle risk-takers. About 1 in 5 young adults say they have recently used drugs, mostly cannabis.[44] Rates of STIs such as chlamydia are increasing, with 15–24-year-olds the most affected group. Around 1 in 10 of the people who get an STI will become re-infected within a year.[45] Teenage conceptions are at a 20-year low (40 cases per 1,000 under 18s), but are still high compared with Western Europe.[46]

1.26 Teenage years are a crucial time for health and wellbeing in later life. Half of lifetime mental illness (excluding dementia) starts by the age of 14.[47] More than 8 out of 10 adults who have ever smoked regularly started smoking before 19,[48] and one study found that 8 in 10 obese teenagers went on to be obese as adults.[49]

1.27 Around 1 in 3 young adults drink to the point of drunkenness, the highest rates among any age group.[50] Accidents due to alcohol (including drink-driving accidents) are the leading cause of death among 16–24 year-olds.[51]

Living well

1.28 Many premature deaths and illnesses could be avoided by improving lifestyles. It is estimated that a substantial proportion of cancers[52] and over 30% of deaths from circulatory disease[53] could be avoided, mainly through a combination of stopping smoking, improving diet and increasing physical activity.

1.29 Reducing smoking rates represents a huge opportunity for public health – smoking is the single biggest preventable cause of early death and illness. There are 2 million fewer smokers now than a decade ago, but 1 in 5 adults still smoke.[54] Smoking is estimated to cost the NHS at least £2.7 billion a year in England.[55]

1.30 2 out of 3 adults are overweight or obese.[56] The estimated cost to the NHS of obesity-related conditions is £4.2 billion each year, and diabetes is rising sharply.[57] Around 7 in 10 people consume more salt than is recommended[58] (leading to an estimated 1 in 3 people with high blood pressure[59]); only 3 in 10 adults eat the recommended 5 portions of fruit and vegetables a day;[60] and only 3 or 4 in 10 adults say they do the recommended levels of physical activity every week.[61]

1.31 The majority of the population either do not drink alcohol at all or, if they do drink, they do so within the Government's lower-risk limits.[62] However, regular heavy drinking is leading to a rapid rise in liver disease, which is now the fifth biggest cause of death in England. Drunkenness is associated with almost half of assaults and more than a quarter of domestic violence incidents.[63]

1.32 We have the lowest levels of illicit drug use since the British Crime Survey began measuring it in 1996. However, we have some of the highest levels of illicit drug use in Europe. More than 1 in 12 adults used an illicit drug in the last year.[64] As well as being exposed to health risks, drug users are more likely to be involved in crime (such as theft and prostitution), to be unemployed and to lose contact with friends and family.

1.33 Diagnoses of STIs are increasing. STIs can have serious consequences for health,[65] including infertility. More than 1 in 4 people with HIV are unaware that they are infected and around 1 in 2 new cases are diagnosed too late.[66]

1.34 Preventing mental ill health represents a huge opportunity: estimates of the burden of mental ill health range from 9%[67] to 23%[68] of the total health burden in the UK. The health and economic cost in England was estimated as £77.4 billion in 2003.[69] There is evidence that mental ill health disproportionately impacts on people from black and ethnic minority communities, the homeless and other socially excluded groups.[70]

1.35 People with mental ill health are much more likely to smoke and die younger, and a large number of people with mental health problems also have alcohol or drug problems. Over 1 in 3 people with a mental disorder smoke.[71]

One study found the life expectancy of people with schizophrenia was 15–20 years lower than that of the general population.[72]

1.36 A total of 1 in 10 people are carers, and analysis of census data shows that 1 in 5 carers providing over 50 hours of care a week say they are in poor health, compared with 1 in 9 non-carers.[73]

1.37 Improving the environment in which people live can make healthy lifestyles easier. When the immediate environment is unattractive, it is difficult to make physical activity and contact with nature part of everyday life. Unsafe or hostile urban areas that lack green spaces and are dominated by traffic can discourage activity. Lower socioeconomic groups and those living in the more deprived areas experience the greatest environmental burdens.

Working well

1.38 The health and wellbeing of people of working age is critical to supporting the economy and society. Being in work is in general good for health, while being out of work can lead to poorer physical and mental health.[74]

1.39 Reducing working-age ill health has the potential to save the UK up to £100 billion a year, around the size of the entire annual NHS budget.[75] Around 172 million working days were lost to sickness absence in 2007, at a cost to the economy of over £13 billion.[76]

Some 17% of people claiming incapacity benefit have a musculoskeletal condition, many of which are preventable.[77]

1.40 Taking a preventive approach to mental health presents a significant opportunity for reducing absence from work: 9.8 million working days were lost in Britain in 2009/10 due to work-related stress, depression or anxiety alone.[78]

Ageing well

1.41 Our population is ageing rapidly, but we are living longer and staying fitter for longer – today's 65-year-olds are more active and well than ever before.[79] Maintaining social networks, being part of a community and staying active all benefit health and wellbeing in later life. By 2024, an estimated 50% of the population will be over the age of 50, due to a combination of increased life expectancy and low birth rates. This is particularly significant in rural areas: the average age of rural residents is nearly six years older than people living in urban areas.[80]

1.42 Dementia affects around 750,000 people in the UK and numbers are expected to double by 2030.[81] The annual costs of dementia in the UK amount to £17 billion.[82] Half of dementias have a vascular component; by improving diet and lifestyle in earlier life we can significantly reduce their impact.

1.43 A total of 1 in 4 older people have symptoms of depression requiring professional intervention.[83] Better treatment for this group could improve their health outcomes considerably. Estimates suggest that around 1 in 10 older people experience chronic loneliness, with people living in deprived areas experiencing much higher rates.[84]

Life expectancy at 65 is now more than 20 years for women, and more than 17 years for men – higher than it has ever been.[85]

1.44 There are increasing numbers of frail older people, and many people over 65 are also carers. In winter 2008/09, there were 35,000 excess deaths[86] in England, many of which could have been prevented.[87]

1.45 Each year 1 in 3 people over 65 and almost 1 in 2 people over 85 experience one or more falls, many of which are preventable.[88] Hip fracture is the most common serious injury related to falls in older people. Around 76,000 hip fractures occur in the UK each year,[89] costing the NHS £1.4 billion, and numbers may double by 2050.[90]

Seizing these opportunities

1.46 This White Paper sets out how society can seize these opportunities to improve the public's health and wellbeing and reduce health inequalities. The new system:

- will have a strategic focus on the outcomes that matter most;
- focus on doing what works in order to make the biggest difference;
- harness efforts across society – individuals, families, local and national government, and the private, voluntary and community sectors – to tackle these issues; and
- put local government in a leadership role as, given the huge variations across the country, local councils are best placed to address the particular issues that their areas face.

2. A radical new approach

Summary

The current approach and system is not up to the task of seizing these huge opportunities for better health and reduced inequalities in health. This White Paper sets out a radical new approach that will empower local communities, enable professional freedoms and unleash new ideas based on the evidence of what works, while ensuring that the country remains resilient to and mitigates against current and future health threats. This approach will reach across and reach out – addressing the root causes of poor health and wellbeing, reaching out to the individuals and families who need the most support – and be:

- **responsive** – owned by communities and shaped by their needs;
- **resourced** – with ring-fenced funding and incentives to improve;
- **rigorous** – professionally-led and focused on evidence; efficient and effective; and
- **resilient** – strengthening protection against current and future threats to health.

Protecting the population from health threats should be led by central government, with a strong system to the frontline. But beyond that, local leadership and wide responsibility across society is the way to improve everyone's health and wellbeing, and tackle the wider factors that influence it, most effectively. Efforts should be focused on the outcomes that matter most, doing what works best to get there, with transparency about outcomes to enable accountability. When central government needs to act, the approach will reflect the core values of freedom, fairness and responsibility by strengthening self-esteem, confidence and personal responsibility; positively promoting healthy behaviours and lifestyles; and adapting the environment to make healthy choices easier. We will balance the freedoms of individuals and organisations with the need to avoid harm to others, and we will use a 'ladder' of interventions to determine the least intrusive approach possible, aiming to make voluntary approaches work before resorting to regulation.

Reaching across and reaching out – addressing the root causes of ill health

2.1 There has not been enough focus on the root causes of ill health. Mental and physical health and wellbeing interact, and are affected by a wide range of influences throughout life.

2.2 Central government can play a part in shaping some of these influences and must have a firm grip both on protecting people against serious health threats and on preparing for emergencies. However, top-down initiatives and lectures from central government about the 'risks' are not the answer. And while the NHS will continue to have a critical role to play, it cannot tackle all the wider factors on its own.

2.3 A new approach is needed, which gets to the root causes of people's circumstances and behaviour, and integrates mental and physical health. The latest insights from behavioural science need to be harnessed to help enable and guide people's everyday decisions, particularly at the key transition points in their lives, such as when they start or leave school, start a family or retire.

2.4 Wider factors that shape the health and wellbeing of individuals, families and local communities – such as education, employment and the environment – also need to be addressed in order to tackle health inequalities.

2.5 Responsibility needs to be shared right across society – between individuals, families, communities, local government, business, the NHS, voluntary and community organisations, the wider public sector and central government:

- **Individuals should feel that they are in the driving seat for all aspects of their and their family's health, wellbeing and care.** This applies to people maintaining their wellbeing and preventing ill health; if they have a long-term condition, keeping as well as possible and managing it to avoid it worsening; and being true partners in their care so that decisions are shared as far as possible, based on the right information and genuine dialogue with health professionals. For public health as for social care, the vision is services and support delivered in a partnership between individuals, communities, the voluntary sector, the NHS and local government – including wider support services such as housing.

- **Local government is best placed to influence many of the wider factors that affect health and wellbeing.** We need to tap into this potential by significantly empowering local government to do more through real freedoms, dedicated resources and clear responsibilities, building on its existing important role in public health.

- **The NHS continues to have a crucial role.** Preventing ill health, screening for disease, supporting people with long-term conditions, improving access to care for the whole population and tackling health emergencies are all key functions that the NHS provides. GPs, community nurses, allied health professionals, dentists and pharmacists in the community, and hospital-based consultants and nurses all play a vital part.
- **Charities, voluntary organisations and community groups already make a vital contribution.** They provide services to individuals and communities, act as advocates for excluded groups and catalysts for action. The Government will encourage partnership working and opportunities for providers from all sectors to offer relevant services.
- **Businesses must take more responsibility for the impact of their practices on people's health and wellbeing.** The Government will work collaboratively with business and the voluntary sector through a new Responsibility Deal.
- **Employers from all sectors should look to support the health and wellbeing of their staff.** There are potentially major benefits for them and their staff if they do. The NHS will lead the way on this.
- **Central government will continue to play an important role.** We will directly co-ordinate activity to protect people from serious health threats and emergencies. And we will create the right system and incentives to free-up local communities to improve health and reduce inequalities, doing only what is necessary across central government to enable this. In all cases, we will ensure that we use proportionate and effective approaches, reflecting the core values of freedom, fairness and responsibility.

Responsive – owned by communities, shaped to meet their needs

2.6 Centralisation has failed. There have been far too many central initiatives, with power hoarded in Whitehall. Multiple top-down targets about improving health and reducing inequalities have been imposed on local communities.

2.7 We will end this top-down government. It is time to free up local government and local communities to decide how best to improve the health and wellbeing of their citizens, deciding what actions to take locally with the NHS and other key partners, without undue interference from the centre.

2.8 We propose to do this through new freedoms and funding for public health in local government. This will be supported by a proposed public health outcomes framework and a 'health premium', which will incentivise local government and communities to improve health and reduce inequalities, while leaving them free to decide how best to do this, in line with local needs. Data will be published to make it easier for local communities to compare themselves with others across the country and to incentivise improvements.

2.9 We have been working closely with partners, and will shortly consult on detailed proposals for a public health outcomes framework, so that local communities, local government, the NHS and other key partners have an opportunity to shape it. This will sit alongside the proposed NHS outcomes framework[91] and social care outcomes framework.[92] We propose that the public health outcomes framework should cover five broad 'domains' of public health:

- Domain 1 – Health protection and resilience: protecting people from major health emergencies and serious harm to health;
- Domain 2 – Tackling the wider determinants of ill health: addressing factors that affect health and wellbeing;
- Domain 3 – Health improvement: positively promoting the adoption of 'healthy' lifestyles;
- Domain 4 – Prevention of ill health: reducing the number of people living with preventable ill health; and
- Domain 5 – Healthy life expectancy and preventable mortality: preventing people from dying prematurely.

Resourced – based on ring-fenced funding, with incentives to improve

2.10 Public health budgets have been squeezed. Prevention has not enjoyed parity with NHS treatment, despite repeated attempts by central government to prioritise it. Public health funds have too often been raided at times of pressure in acute NHS services and short-term crises.

2.11 It is time to prioritise public health. The Government will ring-fence public health funds from within the overall NHS budget to ensure that it is prioritised, although it will still be subject to the running-cost reductions and efficiency gains that will be required across the system.

2.12 Alongside the shift of power from Whitehall to local communities we will allocate ring-fenced funds for public health to local authorities to enable them to secure better health and reduce inequalities, working with the NHS and other key partners in their areas.

Rigorous – professionally-led and focused on evidence; efficient and effective

2.13 The system has often let the workforce down. Public health professionals have been disempowered and their skills not sufficiently valued when compared with their counterparts in NHS acute services. We need to address the imbalance, so that prevention and public health enjoy true parity with treatment.

2.14 Subject to the passage of the Health and Social Care Bill, the Government proposes to set up a new public health service – Public Health England. This will be a uniting force for the wider family of professionals who also spend time on improving people's lives and tackling inequalities.

2.15 There is patchy use of evidence about 'what works'. Despite much activity at both national and local levels, further progress is needed to build and apply the evidence base for 'what works' and to ensure that resources are used most effectively and are linked to clear health outcomes. A culture of using the evidence to prioritise what we do and test out innovative ideas needs to be developed, while ensuring that new approaches are rigorously evaluated and that the learning is applied in practice.

2.16 The Government will harness the information revolution to make the best use of evidence and evaluation and support innovative approaches to behaviour change throughout society.

Resilient – strengthening protection against current and future threats to health

2.17 The current system for health protection is fragmented. The UK has responded excellently to public health incidents and emergencies in recent years, but the system lacks integration and is over-reliant on goodwill to make it work. A stronger, more integrated system is needed, which is equipped to meet future threats and has a clear line of sight from the top of government to the frontline.

2.18 The Government is therefore taking forward proposals for enhancing the functions of the Secretary of State for Health, making accountabilities in the system clearer and creating a new streamlined public health service to lead health protection and public health efforts across the country.

Intervening effectively

2.19 When central government needs to act, we will balance the freedoms of individuals and organisations with the need to avoid harm to others. We will aim to make voluntary approaches work before resorting to regulation.

2.20 The arguments about when it is appropriate for government to intervene in people's health and to what extent have become oversimplified. They are often presented as a straightforward choice between two extremes – intrusive intervention into people's lives or completely hands-off. These fail to capture the wide range of interventions that are available and the need to make decisions on a case-by-case basis about which to use.

2.21 A more sophisticated approach is needed. As Richard Reeves' independent report *A Liberal Dose?*[93] concluded, there is no 'magic equation' for how and when government should intervene. But there are some sensible criteria that government can apply, reflecting our core values.

2.22 **First, the Government will recognise that protecting and improving people's health covers a wide spectrum of issues that demand very different approaches.** The issues range from serious biological, chemical and infectious disease threats where central government must take a strong lead, to diseases such as diabetes, heart disease and depression, which are linked to people's lifestyles and situations and require local solutions that are tailored to people's different needs.

2.23 **Second, the Government will balance the freedoms of individuals and organisations with the need to avoid serious harm to others.** We will look carefully at the strength of the case before deciding to intervene and to what extent. This must be based on a rigorous assessment of the evidence about health and wider harms, with the potential benefits balanced against the social and economic costs to individuals, organisations and wider society.

2.24 **Third, the Government will consider different approaches for different groups of the population, taking account of the significant barriers that some people face.** We will treat capable, responsible and informed adults as adults. We will treat children differently as they rely more on adults to help make decisions or to make decisions for them when they are very young. We should also recognise that some individuals may need more support because they face particular barriers. We need to use different approaches for different people, drawing on the latest evidence from behavioural science to do this.

A 'ladder' of interventions

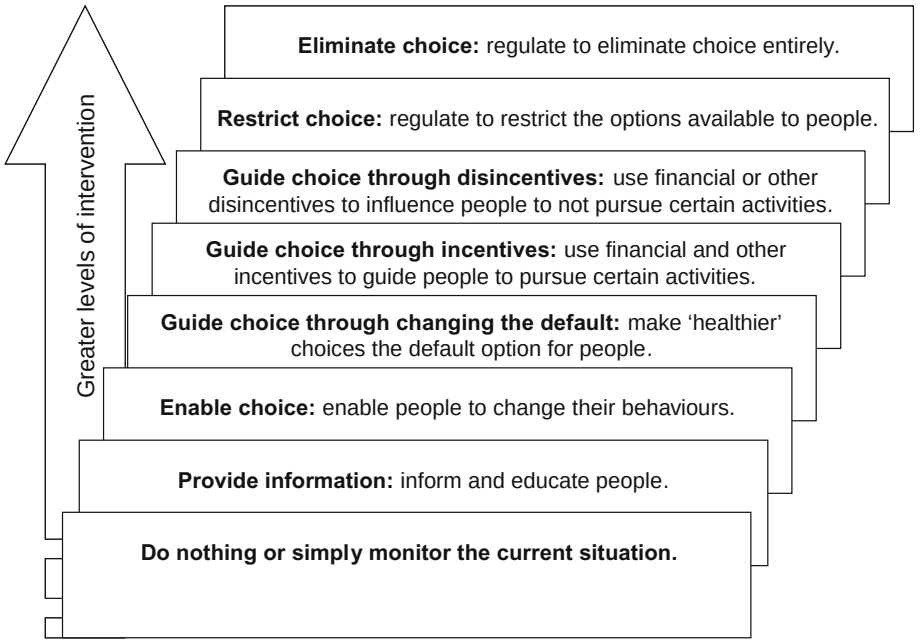
2.25 The public expect government to prepare for and tackle serious, unavoidable threats and emergencies – such as radiation, chemical spills, pandemic flu or terrorism – on their behalf. These cases can demand direct intervention from a range of central government departments and need the firm grip of the Secretary of State for Health.

2.26 There are also some activities that it makes sense to do once at national level rather than repeat many times over at local level. This includes making sure that air, food and water meet safety standards; buying vaccines and planning immunisation programmes; providing specialist expertise to support local incidents; and legislating to ban some types of drugs.

2.27 Across all these areas, government needs to keep up its guard, ensuring that it is vigilant against existing and emerging health threats and is fully prepared to respond if and when they arise.

2.28 When it comes to improving people's health and wellbeing, we need a different approach. We cannot just ban everything, lecture people or deliver initiatives to the public. This is not justified and will not work. Nor should we have one-size-fits-all policies that often leave the poorest in our society to struggle.

2.29 Few of us consciously choose 'good' or 'bad' health. We all make personal choices about how we live and behave: what to eat, what to drink and how active to be. We all make trade-offs between feeling good now and the potential impact of this on our longer-term health. In many cases, moderation is often the key.



2.30 All capable adults are responsible for these very personal choices. At the same time, we do not have total control over our lives or the circumstances in which we live. A wide range of factors constrain and influence what we do, both positively and negatively.

2.31 The Government's approach to improving health and wellbeing – relevant to both national and potential local actions – is therefore based on the following actions, which reflect the Coalition's core values of freedom, fairness and responsibility. These are:

- strengthening self-esteem, confidence and personal responsibility;
- positively promoting 'healthier' behaviours and lifestyles; and
- adapting the environment to make healthy choices easier.

2.32 The Nuffield Council on Bioethics' 'intervention ladder' shows the range of potential approaches which could be used to promote positive lifestyle changes in this way (see Figure 2.1).[94] The options range from the least intrusive into people's lives (such as just providing information) to the most intrusive (eliminating people's choice about what they do through legislation):

Figure 2.1: A ladder of interventions

2.33 Where the case for central action is justified, the Government will aim to use the least intrusive approach necessary to achieve the desired effect. We will in particular seek to use approaches that focus on enabling and guiding people's choices wherever possible.

2.34 This includes changing social norms and default options so that healthier choices are easier for people to make. There is significant scope to use approaches that harness the latest techniques of behavioural science to do this – nudging people in the right direction rather than banning or significantly restricting their choices.

2.35 Working through our new Public Health Responsibility Deal, the Government will aim to base these approaches on voluntary agreements with business and other partners, rather than resorting to regulation or top-down lectures. However, if these partnership approaches fail to work, the Government will consider the case for 'moving up' the intervention ladder where necessary. For example, if voluntary commitments from business are not met after an agreed time period, we will consider the case for introducing change through regulation in the interests of people's health.

3. Health and wellbeing throughout life

Summary

The Government is radically shifting power to local communities, enabling them to improve health throughout people's lives, reduce inequalities and focus on the needs of the local population. This chapter highlights local innovation and outlines the cross-government framework that will enable local communities to reduce inequalities and improve health at key stages in people's lives, including:

a. **empowering local government and communities, who will have new resources, rights and powers to shape their environments and tackle local problems;**

b. **taking a coherent approach to different stages of life and key transitions, instead of tackling individual risk factors in isolation.** Mental health will be a key element, and we will shortly publish a new mental health strategy;

c. **giving every child in every community the best start in life.** We will support this through our continued commitment to reduce child poverty, by investing to increase health visitor numbers, doubling by 2015 the number of families reached through the Family Nurse Partnership (FNP) programme, and refocusing Sure Start Children's Centres for those who need them most. An Olympic and Paralympic-style sports competition will be offered to all schools from 2012;

d. **making it pay to work,** through comprehensive welfare reforms, creating new jobs through local growth and working with employers to unleash their potential as champions of public health;

e. **designing communities for active ageing and sustainability.** We will make active ageing the norm rather than the exception, for example by building more Lifetime Homes, protecting green spaces and launching physical activity initiatives, including a £135 million Lottery investment in a Mass Participation and Community Sport legacy programme and a volunteer led walks programme. We will protect and promote community ownership of green spaces and improve access to land so that people can grow their own food; and

f. **working collaboratively with business and the voluntary sector through the Public Health Responsibility Deal** with five networks on food, alcohol, physical activity, health at work and behaviour change. We plan to launch the Deal in early 2011 and expect to be able to announce agreements on further reformulation of food to reduce salt; better information for consumers about food; and promotion of more socially responsible retailing and consumption of alcohol. It will also develop the Change4Life campaign, for example through the 'Great Swapathon', £250 million of partner-funded vouchers to make healthy lifestyle choices easier.

A partnership approach through life

3.1 This White Paper is the Government's response to *Fair Society, Healthy Lives* – the Marmot Review.[95] It adopts an approach which addresses the wider factors that affect people at different stages and key transition points in their lives, and reflects the review's principle of 'proportionate universalism' – by which the scale and intensity of action is proportionate to the level of disadvantage.

3.2 The Government wants all parts of society taking responsibility for health and wellbeing. This White Paper supports the shift to make that happen across government, outlining the high-level framework to empower local communities to deliver local change, and highlighting the opportunities for local government, the private and voluntary sectors to play their part.

3.3 This change will only happen if we base our approach on the reality of people's lives, rather than on policy areas considered in isolation. Consequently, this chapter is framed around those key points and stages in people's lives when mental and physical health outcomes can be most strongly influenced.

3.4 We expect most action to happen at a local level: helping people improve their mental and physical health, wellbeing and resilience, and tailoring support to the different needs of individuals and families at different stages in their lives. By giving local government control of public health resources, we will shift power and accountability to local communities and create healthy places to grow up and grow older in, with new partnerships in important areas, such as housing, planning, schools and transport. As set out in the previous chapter, the role of central government will be to establish a framework so that local action can be most effective, and to do nationally only the things that need to be done at that level. This includes working across multiple departments to address the wider determinants of health through the new Cabinet Sub-Committee on Public Health. This chapter sets out the range of actions we will take across central government.

Starting well

3.5 Starting well, through early intervention and prevention, is a key priority for the Government, developing strong universal public health and early education with an increased focus on disadvantaged families. This approach, proportionate universalism, was advocated in the Marmot Review into health inequalities.

3.6 In local government, there will be new opportunities to develop integrated local strategies between public health services, children's services and the NHS, aligning outcomes and resources. At neighbourhood level, increased numbers of health visitors, working with children's centres and GPs, will lead and deliver the Healthy Child programme, alongside the evidence-based Family Nurse Partnership (FNP) programme. These services, working with partners, will support families to build

community capacity as part of the Big Society. Supporting parents with parenting programmes has a positive impact on both parents' and children's wellbeing and mental health. The Healthy Child Programme also includes breastfeeding support and a range of proven preventive services.

3.7 High-quality universal services will form the foundations to ensure the strongest outcomes for children and their parents. The Department of Health will work with the NHS to continue to strengthen the preventive aspects of maternity services. The Department for Education will continue to offer all families 15 hours a week of high-quality free nursery care for preschool children. The Healthy Child Programme will continue to be delivered by increased numbers of health visitors and their teams, the primary care team, midwives and early years workers, all providing support to families.

3.8 The Department of Health will increase investment in health visitors, through a four-year transformational programme, and will publish a plan shortly. Health visitors will have a new role in building a stronger local community, in partnership with local voluntary and community groups, peer support and befriending networks. The proposed health and wellbeing board and the Joint Strategic Needs Assessment will be key mechanisms to enable high-quality public health input into the commissioning of health visiting services and to strengthen the critical links with other services such as early years services, including children's centres, maternity services and primary care.

3.9 We will also do more to improve the outcomes of those families in need of more intensive support by doubling the capacity of the FNP programme and supporting health visitors to work with families needing additional early intervention. The first phase of single Community Budgets for families with complex needs will enable a focus on prevention through locally co-ordinated support for families with multiple problems.

3.10 Children's centres locally will focus particularly on engaging with families where children are at risk of poor outcomes to ensure that they are ready to thrive when they start school. They will act as hubs for family support and as a base for voluntary and community groups. They will also be alert to children who may be being harmed and take the necessary action to protect them.

3.11 Central government will continue to tackle child poverty, aiming to eradicate it by 2020, and will publish a strategy for child poverty in the spring. We are also committed to investigating a new approach to supporting vulnerable families, potentially through intensive intervention models such as Family Intervention Projects and group parenting programmes.

3.12 Wider society, including employers, has a role to play in supporting families. The Department of Health will work in partnership with employers to encourage breastfeeding-friendly employment policies, through pilots involving an acute NHS trust, over 300 children's centres in areas with low breastfeeding rates, a primary school and a secondary school.

Developing well

3.13 The shift of power from central government to schools and local communities provides new opportunities and incentives to forge local partnerships to deliver better health outcomes for children and young people. The pupil and health premiums will ensure that funding is weighted to address inequalities and narrow the gap in health and education.

3.14 We expect excellent health and pastoral support to continue to be a hallmark of good schools. Good schools understand well the connections between pupils' physical and mental health, their safety, and their educational attainment. However, it is not for government to tell schools how they should do this. Schools will be able to draw on additional expertise from local health professionals and children's services, to best meet the needs of their pupils.

3.15 Directors of Public Health (DsPH) will be able to work with their local authority children's services colleagues, schools and other partners to determine local strategies for improving child health and wellbeing. They will be supported by consolidation of existing guidance into best practice resources for schools, further education and training providers. The Healthy Schools, Healthy Further Education and Healthy Universities programmes will continue to be developed by their respective sectors, as voluntary programmes, collaborating where appropriate and exploring partnership working with business and voluntary bodies.

3.16 Good schools will be active promoters of health in childhood and adolescence, because healthy children with high self-esteem learn and behave better at school. Within the current non-statutory personal, social and health education (PSHE) framework, schools will provide age-appropriate teaching on relationships and sexual health, substance misuse, diet, physical activity and some mental health issues. The Department for Education (DfE) will conduct an internal review to determine how they can support schools to improve the quality of all PSHE teaching, including giving teachers the flexibility to use their judgement about how best to deliver PSHE education. Schools will also have a role in tackling these issues as part of their pastoral role, linking to local agencies and community groups where appropriate. Central government will also bring together a group of experts to identify non-legislative solutions to tackling low levels of body confidence and will take account of their views when developing policy.

3.17 As young people move through their teenage years and make the transition into adulthood, our aim is to strengthen their ability to take control of their lives, within clear boundaries, and help reduce their susceptibility to harmful influences, in areas such as sexual health, teenage pregnancy, drugs and alcohol. And they should have easy access to health services they trust, for example accredited 'You're Welcome' young-people-friendly services. Public health funding, alongside the new early intervention grant, will allow local areas to develop a tailored approach that responds to the needs, age and vulnerability of the young person, and particularly targets at-risk groups.

3.18 Improving self-esteem and developing positive social norms throughout the school years should be the focus of local strategies and will be supported by information about effective behavioural interventions for self-esteem. We need to develop approaches that tackle the root causes of failure, rather than reacting to behavioural problems with programmes designed to tackle their symptoms. School-based mental health promotion can improve self-esteem and reduce risky behaviour, particularly for those at higher risk.

3.19 Families will be supported to make informed choices about their diet and their levels of physical activity, including through updated guidelines on physical activity. The Department of Health will broaden the Change4Life programme to take a more holistic approach to childhood issues, for instance covering mental wellbeing and strategies to help parents talk to their children about other health issues and behaviour, such as alcohol. The Department for Education will maintain existing standards for school food.

3.20 Children need access to high-quality physical education (PE), so DfE will ensure the requirement to provide PE in all maintained schools is retained and will provide new support to encourage a much wider take up of competitive team sports. The Department for Culture, Media and Sport (DCMS) will create an Olympic and Paralympic-style school sports competition, which will be offered to all schools from 2012, building on Change4Life clubs in schools. This year the Government is supporting walking and cycling in schools through the Department of Health's Living Streets 'Walk Once A Week' initiative and the Department of Transport's (DfT) funding for Bikeability cycle training. We are working towards every child being offered high-quality instruction on how to ride safely and confidently by the end of year 6 of school.

3.21 The Healthy Child Programme for school-age children will continue to be commissioned to provide those developing services with a clinical evidence based framework, including an expanded talking therapies service. The National Child Measurement Programme will continue to run, providing local areas with information about levels of overweight and obesity in children to inform planning and commissioning of local services.

3.22 Responding to local need, the school nursing service will work with other professionals to support schools in developing health reviews at school entry and key transitions, managing pupils' wellbeing, medical and long-term condition needs and developing schools as health-promoting environments. The Department of Health is developing a new vision for school nurses, reflecting their broad public health role in the school community.

London vs New York schools walking competition

Technological advances and behavioural insights are blended together in this innovative approach to encouraging exercise in children. Pupils at two secondary schools in London were offered incentives to walk to school through Step2Get, using new near field communication (NFC) technology. In a partnership between Intelligent Health and Transport for London (TfL), each student was provided with a swipe card which they touched on receivers placed on lampposts along a safe walking route to school.

Each completed walk to school was converted to points and these were redeemed as rewards as part of an online game. There was a resulting 18% shift to walking. For every £1 invested in Step2Get, there was a £24 benefit to TfL and the local authority, linked to a reduction of 48% in police time due to less overcrowding at bus stops and on buses and fewer accidents.

In 2011/12, secondary schools in London will compete against those in New York using the same NCF technology. An estimated 30,000 students will take part, with each school competing to accumulate the greatest number of completed walks along the safe routes to school. The overall winning city will be announced at the time of the 2012 London Olympic and Paralympic Games.

There is a strong theme of behavioural science underlying this initiative. Reframing the concept of exercise as a fun and positive game taps into salience, while rewards and the social aspect strongly incentivise a change in behaviour.

As part of the London 2012 legacy, the technology will be available as a social enterprise to any school in the world. This will encourage thousands of children worldwide to walk safely and be more active, and will reduce carbon dioxide emissions associated with travel.

www.intelligenthealth.co.uk/services/schools.html

3.23 For children and adolescents with mental health problems, central government will support interventions that promote mental health resilience and effective early treatment, including talking therapies, thus reducing the likelihood of problems extending into adulthood. The Department of Health will shortly set out its approach in a mental health strategy. We will continue to tackle violence and abuse that can damage the physical and mental health of children, either through

direct experience or witnessing violence in their household. Child protection services will also be able to work more closely with public health within local government. Safeguarding duties will of course continue to apply to health services commissioned under the new arrangements for local government.

3.24 Central and local government are responsible for protecting children through tobacco control legislation and enforcement, including preventing sales to under-18-year-olds.

3.25 Since the prohibition of tobacco advertising, the only way that tobacco products can be promoted is at the point of sale. The Government will look at whether the plain packaging of tobacco products could be an effective way to reduce the number of young people taking up smoking and to help those who are trying to quit smoking. The Government wants to make it easier for people to make healthy choices, but will clearly need to make sure that there is good evidence to demonstrate that plain packaging would have a public health benefit, as well as carefully exploring the competition, trade and legal implications of the policy. Details on how we propose to proceed will be set out in the Tobacco Control Plan.

3.26 The recent legislation to stop tobacco sales from vending machines will come into effect on 1 October 2011, so removing an easy source of cigarettes from under-age smokers and a source of temptation for adults trying to quit. We are also considering options for the display of tobacco in shops, recognising the need to take action both to reduce tobacco consumption and to reduce burdens on businesses. An announcement about this will follow shortly.

3.27 Adolescence is a significant transition point for young people, particularly young disabled people, those with special educational needs and those not in education, employment or training. The forthcoming Special Educational Needs and Disability Green Paper will set out in detail the Government's plans to improve outcomes for children and young people, to promote greater choice for their families across health, education, social care and other services, and to support transitions.

3.28 To support the transition from school to further education or work, the Government has pledged to create up to 75,000 additional apprenticeship places by 2014/15. We are committed to the participation of all 16 and 17-year-olds in education or training and to raising the participation age to 18 by 2015. We will ensure that young people have access to independent, high-quality careers advice – supporting young people not in training or education to get a good start to their working life. We will improve self-esteem, and promote personal responsibility and a more engaged and cohesive society through National Citizen Service, which we will pilot for around 10,000 young people in summer 2011.

Living well

3.29 For a long time, central government's default position has been to solve problems by drawing more power to the centre and lecturing people about how to live well. This often does not work. Therefore, we are turning to local communities to devise local solutions which work for them, to create the right kind of environment and build a critical mass of opinion to change behaviours.

3.30 Rather than central government nagging individuals and businesses to become more healthy, we believe that sustained behaviour change will only come about with a new approach – genuine partnership. A key component of our approach is the Public Health Responsibility Deal. We are working collaboratively with business and the voluntary sector, and have established five networks on food, alcohol, physical activity, health at work and behaviour change. We plan to launch the Deal in early 2011 and expect to be able to announce agreements on further reformulation of food to reduce salt; better information for consumers about food; and promotion of more socially responsible retailing and consumption of alcohol. And during January 2011's Change4Life 'Great Swapathon', partners will give £250 million of vouchers to make healthy lifestyle choices easier.

Change4Life Convenience Store Programme

This partnership between the Department of Health and the Association of Convenience Stores is aimed at increasing the availability and sales of fresh fruit and vegetables in convenience stores in deprived areas. Work includes the positioning of dedicated fruit and vegetable chiller cabinets in prominent positions and the use of Change4Life branding.

By March 2010, 160 stores in four regions were retailing fresh fruit and vegetables using the popular Change4Life brand. By March 2011, Change4Life convenience stores will be active in every region of the country. Evaluation shows an increase in sales of fruit and vegetables of up to 50% in some stores. Participating stores have also seen total sales rising across the board by an average of 11%, and the percentage of customers saying the store was a good place to shop overall rising from 43% to 54%.

Many stores have used the programme to engage with local schools and cooking clubs and are supporting them through fruit tuck shops, providing fruit at parents' evenings and providing fresh ingredients for use in cooking lessons at cost price.

3.31 The Department for Environment, Food and Rural Affairs' (Defra) Fruit and Vegetable Task Force has recommended that food containing fruit or vegetables with other types of food should be added to the 5 A DAY licensing scheme. This work is ongoing with industry and the voluntary sector. In addition, Government Buying Standards for food will support more balanced choices in areas that central government is directly responsible for, such as in its own workplaces.

3.32 Active travel and physical activity need to become the norm in communities. The Department of Health will support local areas by providing good evidence on how to make regular physical activity and healthy food choices easier for their populations, for example by sharing learning from the experiences of the nine 'Healthy Towns', as well as sustainable travel and cycle towns. Initial evidence from the first round of cycle towns showed that there was an increase in cycling across all social groups combined with a reduction in sedentary behaviour and single car use, when compared with people in similar towns.

3.33 Local sustainable transport, including active travel, will be supported through the Department for Transport's £560 million Local Sustainable Transport Fund. We will also be outlining how we will further support local authorities to take forward sustainable transport in the upcoming Local Transport White Paper.

Health inequalities, sustainability and climate change

'The sustainability agenda and climate change can help frame the way healthy communities and places are created… and create conditions that enable everyone to flourish equally.'[96]

The cognitive bias of most people means that they are likely to discount the future for the sake of the present and are more likely to respond to instant rewards.[97] The Marmot Review argues that climate change is one of the biggest public health threats of the 21st century,[98] with the potential to increase health inequalities. There are community responses that can help address long-term challenges like climate change while having a positive impact on health in the short-term, through:

- active travel – delivering low-cost health improvements and reducing emissions;
- green spaces – improving mental health and the quality of community life, offering some protection from the expected increase in heatwaves and flooding;
- spatial planning – promoting local ownership and occupation of public spaces;
- behaviour change – embedding new ways of sustainable living and working; and
- community projects to harness renewable energy – mitigating the effects of climate change.

3.34 Building on the Olympics, DCMS has announced a £100 million Mass Participation and Community Sport legacy programme, which will improve community sport facilities, improve and protect playing fields for community use, provide opportunities for sports volunteers and leaders, and deliver an open programme of personal challenge. The Walking for Health programme of volunteer-led health walks and Let's Get Moving will also provide important opportunities for people to be active.

3.35 Local government and communities will have new resources, rights and powers to shape their local areas. The Department for Communities and Local Government (DCLG) will support local areas with streamlined planning policy that aligns social, economic, environmental and health priorities into one place. Health considerations are an important part of planning policy and DCLG will consider how to take this forward in the new National Planning Policy Framework.

3.36 Access to green spaces is associated with better mental and physical health across socioeconomic groups. DCLG is working with Defra to create a new designation to protect green areas of particular importance to local communities and providing practical guidance to support community groups in the ownership of public spaces. It is intended that, through this new designation, people will have improved access to land, enabling them to grow their own food.

3.37 Defra will also lead a national campaign to increase tree-planting throughout England, particularly in areas where increased tree cover would help to improve residents' quality of life and reduce the negative effects of deprivation, including health inequalities. The charity Campaign for Greener Healthcare has developed a five-year project to improve the health of staff and patients through access to green spaces. It aims to plant one tree per employee – over a million trees – on NHS land. As well as green spaces, good air quality and reducing noise pollution are important issues for public health and wellbeing. Defra will publish information about local air quality and noise levels, empowering local government and communities to take action.[99] Finally, there is growing interest in promoting access to so called 'blue spaces' such as inland waterways and 'yellow spaces' (beaches and coastlines).

Run Dem Crew and the Nike 'Grid'

Three years ago, Charlie Dark, a teacher, writer and DJ in Hackney, east London, came up with a novel idea to empower local young people. He created a running club called Run Dem Crew (RDC), partnering with sportswear company Nike. RDC is based at Nike's 1948 Brand Space in Shoreditch and combines running and creative arts workshops to turn regular running into a trendy social activity.

Teaming up with the charities Fairbridge and the Active Communities Network, the concept has spread throughout England: 11 crews now exist in five different cities across the UK, led by 25 volunteer champions. In October 2010, all crews took part in a competitive event linked to the 'Grid', Nike's real-time online running-based gaming and social network. Crew members were encouraged to 'own the Grid' – to reclaim the streets as a safe and exhilarating place in which to live and play.

This innovative idea builds on lessons from behavioural science and aims to turn a generation of gamers into runners. Charlie Dark inspires young people, and uses creative workshops as a 'hook' to get young people interested in running. The social aspect of the running crews changes the perceived norm among young people that running is a boring, solitary activity. Running clubs have to earn the right to call themselves a RDC, and the support from Nike that that entails.

www.rundemcrew.com

3.38 The introduction of the Licensing Act 2003 and 24-hour licences promised to introduce a continental-style café culture. Instead, in 2009/10 nearly half of all violent crime was alcohol-related and communities are fighting a constant and expensive battle against alcohol-related crime and anti-social behaviour. The Home Office will seek to overhaul the Licensing Act to give local authorities and police stronger powers to remove licences from, or refuse licences to, any clubs, bars and pubs that are causing problems, close any shop or bar found to be persistently selling alcohol to children and charge more for late-night licences. The Home Office is committed to implementing the ban on selling alcohol below cost without delay.

Healthy Living Pharmacies, Portsmouth

Healthy Living Pharmacies (HLPs) are making a real difference to the health of people in Portsmouth, with 10 pharmacies awarded HLP status by NHS Portsmouth. HLPs have to demonstrate consistent, high-quality delivery of a range of services such as stopping smoking, weight management, emergency hormonal contraception, chlamydia screening, advice on alcohol and reviews of the use of their medicines. They proactively promote a healthy living ethos and work closely with local GPs and other health and social care professionals.

Early indications show that HLPs have greater productivity and offer higher-quality services. Early evaluation results include a 140% increase in smoking quits from pharmacies compared with the previous year; and 75% of the 200 smokers with asthma or chronic obstructive pulmonary disease who had a medicines use review accepted help to stop smoking.

www.portsmouth.nhs.uk/Services/Guide-to-services/resources-for-professionals.htm

3.39 Reducing smoking will continue to be a focus for public health. We will work to create environments that further discourage smoking and help bring about cultural change to make it less attractive. The Department of Health will publish the Tobacco Control Plan shortly. We will maintain the current smokefree laws in England. We will publish an academic review of the evidence about the impact of the legislation alongside the Tobacco Control Plan, showing high levels of compliance and public support. By creating the right environment for more people to take responsibility for their health, individuals benefit and there is also less cost to the taxpayer.

3.40 NHS Health Checks will continue to be offered to men and women aged 40 to 74. Everyone receiving an NHS Health Check will receive individually tailored advice and support to help manage their risk of heart disease, stroke and diabetes. The assessment can be carried out in a variety of settings, including pharmacy and community settings and the workplace, to help ensure that the service is accessible to all those eligible, including those in groups at highest risk of these diseases. The Department of Health will strengthen its partnership working with the pharmaceutical industry and community pharmacies to secure their support and investment in campaigns to promote effective routes to quit smoking.

3.41 The Department of Health will align funding streams on drug and alcohol treatment services across the community and in criminal justice settings. Funding will incentivise recovery outcomes while maintaining key public health measures such as needle exchange schemes. It is critical that, where appropriate, people are diverted from the criminal justice system to health services. There they can receive treatment for mental illness and drug and alcohol misuse, with benefits to their health and reducing their risk of reoffending.

3.42 Public health professionals will work locally to prevent people from taking harmful drugs, to reduce the drug use of those already taking drugs, and to help people to be drug free, recover fully and contribute to society. Details of our approach will be set out in a forthcoming cross-government drugs strategy. It will seek to prevent people taking illicit drugs at all ages, and arrest the slide into dependency.

Altogether Better Community Health Champions

Altogether Better started out as a BIG Lottery-funded regional collaborative and has grown to become a movement with a network that reaches beyond its original Yorkshire and the Humber region to as far away as China. Altogether Better aims to build capacity to empower individuals and communities to improve their own health and wellbeing through a flexible, locally tailored Community Health Champions approach.

Individuals from communities with high health risks are recruited and receive training and support to build their knowledge, confidence and social networks. These skills are used to carry out philanthropic activities so that the Champions act as a positive influence on peers within their homes, their workplace and the community. They are then supported to follow pathways of civic participation, education, employment and enterprise. In only three years there are already over 12,000 Community and Workplace Health Champions who have reached an estimated 60,000 others.

As a key aspect of this work, Altogether Better has built a sound practical evidence base for this approach. This evidence shows that the approach is improving health, as well as increasing individual and community social capital, voluntary activities and wider civic participation. Movement along pathways to education, paid employment and enterprise is also enhanced.

www.altogetherbetter.org.uk

3.43 We will work towards an integrated model of service delivery to allow easy access to confidential, non-judgemental sexual health services (including for sexually transmitted infections, contraception, abortion, health promotion and prevention). The Department of Health is piloting interventions on alcohol misuse linked to sexual health risks in order to manage broader risk-taking behaviour. We will also publish the results of an evidence review for sexual health which will help develop targeted interventions for particular groups, taking account of their specific needs and motivations.

3.44 Central government will sequence social marketing for public health through the life course so that, at each stage in a person's life, there is a meaningful and trusted voice. We will also scale back the number of brands that we support. We will trial new ways of changing behaviours, using emerging ideas from behavioural science, such as the use of social norms, changing defaults and providing incentives. We will publish a social marketing strategy, setting out our plans in more detail, in spring 2011.

The Lesbian and Gay Foundation: Face2Face counselling service, Manchester

Face2Face (F2F) was established in 2008 to provide lesbian and gay people in Manchester with a local service sensitive to the needs of the community. In February 2008, the service implemented the CORE (clinical outcomes routine evaluation) system, which provides a widely recognised quality evaluation of psychological therapies through the monitoring of key outcomes. Since then, over 300 clients have accessed the counselling service reporting a 53% reduction in the average pre-therapy score, taking the client from moderate to low levels of distress. CORE also allows demographic monitoring, to ensure that the service is reaching marginalised groups within the community.

www.lgf.org.uk

3.45 Working with other agencies, public health services will also have a role in tackling violence and abuse. In line with the recently published cross-government strategy, *Call to end violence against women and girls*,[100] the Department of Health produced *Improving services for women and child victims of violence*,[101] setting out how we will improve the health response to violence, building on the findings and recommendations of an independent taskforce. This includes work to improve access to and the quality of sexual assault referral centres (SARCs), which provide medical examinations, treatments and access to long-term support and counselling. We are taking forward the Government's commitment on sharing non-confidential data on gun and knife crime between hospitals and the police.

Working well

3.46 The Government is creating the right framework for enterprise and job creation. Enabling more people to work, safeguarding and improving their health at work, and supporting disabled people or people who have health conditions to enter, stay in or return to work are critical components of our public health challenge. Central and local government will support economic growth, make it pay to work through radical reform of the welfare system and provide support to people trying to enter work. For those in work, government will work in partnership with business to safeguard and improve health at work, and support disabled people, people with health conditions or people with caring responsibilities to stay in or return to work.

3.47 Local government, central government and businesses are working to create new jobs and opportunities. We will work in partnership, creating strong, sustainable growth, creating access to opportunities for all, supported by the £1.4 billion Regional Growth Fund over three years. Central government is supporting the creation of apprenticeships, internships, work pairing and college and workplace training places, creating opportunities for development for the most disadvantaged, including disabled people. We will also promote the expansion of volunteering opportunities that can be an effective route to gaining skills and employment, for example by supporting the training of volunteer Community Learning Champions to engage local people in learning activities, acquiring new skills and embarking on new career routes.

3.48 Central government is making it pay to work. A reformed Welfare to Work programme is being developed, ensuring that work always pays by replacing existing means-tested working-age benefits with a single Universal Credit. Existing support will be consolidated into a new integrated Work Programme to provide support for people to move into work; Work Choice will provide support for severely disabled people entering work; and existing adult careers advice has been simplified into a single service called NextStep.

3.49 Central government is also helping people to stay in work. Our innovative Fit for Work Service pilots are multi-disciplinary projects delivered by local providers, focusing on early intervention and designed to get workers who are off sick back to work faster and to keep them in work. The programme is being evaluated and the results, due in late 2011, will enable us to determine what works and in what circumstances.

3.50 The new Fit Note was introduced in April 2010, allowing GPs and individuals to focus on how to get people on sick leave back into work. Central government will support the NHS to embed this and implement the Fit Note electronically in GP surgeries as soon as possible. We are also examining the incentives in the sickness absence system, with a view to reducing the numbers of people who fall out of work due to health conditions and end up on benefits.

3.51 New provisions in the Equality Act 2010 came into force on 1 October. The Act prohibits employers from asking health or health-related questions before offering employment, except where it is an intrinsic function of the job. There is little evidence that pre-employment health screening identifies fitness for work. This empowers occupational health professionals to divert resources away from pre-employment health screening to preventive initiatives for all staff in the workplace.

3.52 Central government, in conjunction with the Faculty of Occupational Medicine, is developing an accreditation process for the new occupational health service standards. All employers will be encouraged to contract only those services that are fully accredited, and to seek preventive interventions. We are exploring a range of models which will help support small and medium-sized enterprises in promoting the health of their workforce, drawing on the expertise of larger companies, the NHS and the broader community, and promoting the better management of chronic conditions in the workplace.

3.53 The Department of Health will work in partnership with employers, through the Public Health Responsibility Deal, to improve health at work. Employers have the opportunity to improve health outcomes in areas from obesity to smoking, substance misuse and physical activity in their employees, employees' families and wider local communities. They can achieve this through establishing a strong cultural lead, strengthening management training in recognising and responding to the health needs of the workforce, and working more closely with others, particularly occupational health and primary care.

3.54 Central government will provide the evidence and data needed to raise awareness among employers of the clear case for investing in the health of their employees. This includes further development of the Change4Life employee wellness programme and the promotion of the Workplace Wellbeing Tool to help organisations assess progress and understand further steps. This important tool can help demonstrate the business case that investing in the health and wellbeing of your workforce will increase productivity as well as staff engagement.

3.55 Dame Carol Black's *Working for a Healthier Tomorrow*[102] review highlighted that working-age ill health was costing England £100 billion a year. Key issues identified include early intervention and prevention, and proactive responses such as health-promoting workplaces, better mental health and employment outcomes, building young people's resilience and lengthening healthy working lives. Effectively addressing health, work and wellbeing provides the potential to reduce inequalities through increased economic prosperity, greater stability and viability of local communities.

Workplace Cycle Challenge

CTC, the national cyclists' organisation, has led a pilot project to encourage people to cycle to work in Swindon as part of its Cycling Champions programme.

The Cycle Challenge works by encouraging and supporting existing cyclists to persuade colleagues who rarely or never cycle to give it a try. The Challenge was a competition open to all organisations in the Swindon area to get the most staff to cycle for just 10 minutes or more. Whole organisations and individual workplaces were encouraged to sign up via the Challenge website – individual cyclists within those organisations could log their personal details and record how much cycling they did.

Overall, 853 participants cycled 37,180 miles between them, of which around 35,000 miles were for transport purposes (i.e. non-recreational travel). It is estimated that they saved 3,157 litres of fuel and £3,630 in reduced motoring costs and burnt 35 million kilojoules of energy.

www.swindoncyclechallenge.org.uk

3.56 With more than 1.4 million staff, the NHS is the largest employer in the UK and can lead by example in looking after the health and wellbeing of its staff. To support this, the Department of Health commissioned Dr Steve Boorman's report on the health and wellbeing of NHS staff. As a result, there is now a pledge in the NHS Constitution to provide support and opportunities for staff to maintain their health, wellbeing and safety. All NHS organisations are putting in place a local health and wellbeing strategy in 2010/11, including being proactive in improving the quality of and speeding up access to occupational health services, and strengthening board accountability for the management of sickness and absence. The NHS is working towards achieving a one-third reduction in sickness absence, which could release up to £555 million a year in efficiency savings.

Ageing well

3.57 All western countries are experiencing rapidly ageing populations. This is a major challenge for health and care systems typically geared to treating short-term sickness, not preventing and managing long-term mental and physical conditions in later life. As individuals grow older, key moments such as retirement or bereavement can be a catalyst to decline.

3.58 However, this decline is not an inevitable part of ageing. Public health will have a major leadership role in prevention, promoting active ageing and tackling inequalities. And by using the latest thinking from behavioural science, communities can be better designed to enable active ageing to become the norm rather than the exception.

3.59 Local government's new role in public health presents an opportunity to address this challenge. Public health will be better integrated with areas such as social care, transport, leisure, planning and housing, keeping people connected, active, independent and in their own homes. Neighbourhoods and houses can be better designed to support people's health, such as by creating Lifetime Homes, and by maintaining benefits such as the winter fuel allowance and free bus travel, which keep people active and reduce isolation.

3.60 Strong partnerships between communities, business and the voluntary sector will help address a range of health challenges such as depression and winter deaths. For example, the Department of Energy and Climate Change will develop a Green Deal across sectors to improve the energy efficiency and warmth of homes from 2012, alongside the new Energy Company Obligation. The Obligation will run in parallel with the Green Deal, and will focus particularly on the needs of the most vulnerable and on those in hard-to-heat homes, who will need the most additional support. We will enable older people themselves to contribute and participate more through families, communities and work, which also protects their own physical and mental health.

3.61 The population of rural England is ageing faster than that of urban areas. Sparse older rural populations can present challenges in terms of more limited social networks, transport issues and restricted access to services.

Gloucestershire Village Agents – a rural volunteer network addressing exclusion

Gloucestershire County Council, supported by the Department for Work and Pensions, has developed a scheme of 'Village Agents', volunteers who identify and work with excluded older people to build community capacity. Village Agents are trusted local people, supported by a multi-agency contact centre with links to services for health, social care, housing, personal safety and benefits.

The 2007 evaluation showed that 30 Village Agents made 20,000 contacts with local older people and that there were 2,500 formal referrals. Village Agents helped older people to claim over £300,000 in benefit entitlements, addressing pensioner poverty and supporting the rural economy. The evaluation showed cost-effective impacts on mental health, falls prevention and home safety.

Village Agents have expanded to cover 205 of the 253 parishes in Gloucestershire, and other areas have launched their own versions, including in Essex, Bath and North East Somerset, Leicestershire and Rutland, Northamptonshire and Warwickshire.

www.gloucestershire.gov.uk

3.62 We want to create an environment that supports people in making healthy choices, and that makes these choices easier. On housing, for example, the Lifetime Homes Standard remains an important part of the Code for Sustainable Homes encouraging development of more homes that are accessible and that meet the needs of an ageing population. The Warm Front scheme will also continue until 2012/13, providing grants to improve housing warmth and sustainability.

3.63 Local government provides a range of services to promote active ageing and help people live independently in their homes. We are committed to keeping older people in their homes longer through funding home adaptations and are maintaining programmes such as Supporting People, the Disabled Facilities Grant and Decent Homes, which keep homes safe and in good condition. Local government will also become more closely linked with the NHS through its role in supporting reablement through social care; and district nurses and allied health professionals will contribute to keeping people at home through falls prevention, nutritional advice and using community resources to prevent isolation.

3.64 Carers also play a vital role in supporting people to stay at home. The Department of Health carers' strategy sets out how we will support carers to recognise the value of their contribution, involve them in how care is delivered, support their mental and physical health and enable them to have a work, family and community life. As part of this, the Government is making an additional £400 million available through the NHS over the next four years to support carers' breaks.

3.65 The Government's vision for adult social care sets out the ambition to increase preventive action, keeping people active and independent in the community. Additional resources have been made available from within the health system to support social care services, such as evidence-based preventive services. At local level, Directors of Public Health (DsPH) and Directors of Adult Social Services will be able to work together to commission specific services for older people and those who care for them. These could range from services such as information and advice, through to case-finding for at-risk individuals, delivery of appropriate immunisations and services aimed at minimising disability, deterioration or dependency.

3.66 However, we also need to change social norms and attitudes. Ageist attitudes and practices have a detrimental effect on older people, both directly and through their take-up of services. The Equality Act 2010 will prohibit age discrimination against people aged 18 and over when providing a service or exercising a public function; this affects the Department of Health, the NHS and social care bodies. These provisions will come into force in 2012. The Act also includes a new public sector Equality Duty covering eight protected equality characteristics, including age, which comes into effect in April 2011.

3.67 Local government and central government will work in partnership with businesses, voluntary groups and older people in creating opportunities to become active, remain socially connected, and play an active part in communities – avoiding social isolation and loneliness. For example, Older People's Day on 1 October aims to change attitudes to ageing. This has become a real community movement which celebrates later life and this year included over 3,000 events across the country.

3.68 The Department for Work and Pensions will provide Active@60 grants to voluntary and community groups to establish Community Agents in their area. Volunteers will work with people typically in their 60s to help them make a good start to their later life. They will reach out to those at risk of isolation and exclusion. The Community Agent role has been developed with people from the target group, and draws on the latest behavioural science thinking to help tackle social exclusion.

3.69 We will maintain and improve the standard of living of older people. We are committed to phasing out the default retirement age, allowing employers to use retirement ages of 65 or higher. This will allow people who otherwise would have been prevented from working longer to do so and means that they will be able to maintain the health and social benefits of working. We will also maintain the value of the state pension through the triple guarantee – the basic state pension will increase by the highest of the growth in average earnings, prices or 2.5%.

3.70 The taboo about discussing death and dying means that too many people can reach this critical point of their life unprepared, without having thought about how or where they would like to be cared for. This in turn affects their family and carers as a poor death can lead to a traumatic bereavement, with associated mental and physical health issues. The Department of Health will continue to promote the implementation of the End of Life Care Strategy and in particular the societal strand being led by the National Council for Palliative Care and the Dying Matters national coalition.

A new public health system

3.71 In the next chapter, we outline the Government's proposals for a new public health system which will provide opportunities to forge partnerships for children, working-age adults and older people to improve health and wellbeing throughout life.

4. A new public health system with strong local and national leadership

Summary

Localism will be at the heart of this new system, with devolved responsibilities, freedoms and funding. Directors of Public Health will be the strategic leaders for public health and health inequalities in local communities, working in partnership with the local NHS and across the public, private and voluntary sectors. The Government will shortly publish a response to the recent consultation on proposed new local statutory health and wellbeing boards to support collaboration across NHS and local authorities to meet communities' needs as effectively as possible.

A new, dedicated, professional public health service – Public Health England – will be set up as part of the Department of Health, which will strengthen the national response on emergency preparedness and health protection.

There will be ring-fenced public health funding from within the overall NHS budget to ensure that it is not squeezed by other pressures, for example NHS finances, although it will still be subject to the running-cost reductions and efficiency gains that will be required across the system. Early estimates suggest that current spend on the areas that are likely to be the responsibility of Public Health England could be over £4 billion.

There will be ring-fenced budgets for upper-tier and unitary local authorities and a new health premium to reward progress made locally against elements of the new proposed public health outcomes framework, taking into account health inequalities.

The new system will use the best evidence and evaluation and will support innovative approaches to behaviour change – with a new National Institute for Health Research (NIHR) School for Public Health Research and a Policy Research Unit on Behaviour and Health. There will be greater transparency, with data on health outcomes published nationally and locally.

Public health will be part of the NHS Commissioning Board's mandate, with public health support for NHS commissioning nationally and locally. There will be stronger incentives for GPs so that they play an active role in public health.

The Chief Medical Officer will have a central role in providing independent advice to the Secretary of State for Health and the Government on the population's health. He or she will be the leading advocate for public health within, across and beyond government, and will lead a professional network for all those responsible for commissioning or providing public health.

The core elements of the new system will be set out in the forthcoming Health and Social Care Bill, and are therefore subject to Parliament's approval.

A new public health system: overview

4.1 To meet the challenges set out in earlier chapters, the Secretary of State for Health intends to create a new public health system in England to protect and improve the public's health, improving the health of the poorest, fastest.

4.2 For the first time in a generation, local government will be given the responsibility, backed by ring-fenced budgets and new freedoms, to make a major impact on improving people's health and tackling health inequalities in every community. Top-down targets will be replaced by a new outcomes framework. Directors of Public Health (DsPH) in upper-tier local government and unitary local authorities will lead these efforts, building on the important existing role of local government in public health. We will shortly publish our response to the consultation on proposed local statutory health and wellbeing boards in order to bring together NHS and local government efforts to meet the local population's needs as effectively as possible.

4.3 This will be backed up by a new, dedicated and professional public health service, known as Public Health England, within the Department of Health. Public Health England will bring together a fragmented system; it will do nationally what needs to be done; it will have a new protected public health budget; and it will support local action through funding and the provision of evidence, data and professional leadership. This new service will lead health protection, and harness the efforts of the whole of government, the NHS and the Big Society to improve the public's health.

4.4 The creation of Public Health England, and the strengthening of the role of local government in public health, must not lead to the NHS stepping back from its crucial role in public health. Enabling access to good health services that prevent avoidable illness – including by reaching out to disadvantaged, vulnerable and excluded groups – is crucial throughout people's lives. The NHS has a critical

role to play in emergency preparedness and response, and in promoting health and preventing avoidable illness. This will be reflected in the mandate to the new NHS Commissioning Board (NHSCB) and legislation. There will need to be close partnership working between Public Health England and the NHS at a national level, and between local government, DsPH and GP consortia at the local level.

4.5 The Department of Health is designing the new system based on principles of empowering people, using transparency to drive accountability, and ensuring that communities lead efforts to improve health wherever possible, using evidence-based services and innovations tied to evaluation.

A new role and freedoms for local government

4.6 Local government, including county, district and parish councils, already plays a significant role in protecting and improving the health of its communities, through, for example, environmental health, air quality, planning, transport and housing. Local councils (districts, in two-tier situations) will continue to carry out their statutory duties under the Public Health (Control of Disease) Act 1984, as they do today. These duties include appointing 'proper officers' for the purposes of the 1984 Act. Existing functions in local government that contribute to public health will continue to be funded through the local government grant.

4.7 Local leadership will be at the heart of the new public health system, with new ring-fenced budgets, enhanced freedoms and responsibilities for local government to improve the health and wellbeing of their population and reduce inequalities. The Health and Social Care Bill will provide that upper-tier and unitary local authorities will have a duty to take steps to improve the health of their population. It is proposed that these new functions would be conferred from 1 April 2013.

4.8 Embedding public health within local government will make it easier to create tailored local solutions in order to meet varying local needs. It will also enable joint approaches to be taken with other areas of local government's work (such as housing, the environment, transport, planning, children's services, social care, environmental health and leisure) and with key partners (such as the NHS, police, business, early years services, schools and voluntary organisations).

4.9 The Government will require DsPH to be employed in upper-tier councils (i.e. county councils) and unitary authorities (i.e. district councils, where there is no county council, and borough councils) to lead local public health efforts, a role that can be shared with other local councils if agreed locally. We will keep to a minimum the constraints as to how local government decides to fulfil its public health role and spend its new budget. There will be payment for progress made against elements of the public health outcomes framework.

Local government: joining up local approaches to health and wellbeing

4.10 The Department of Health recently consulted on proposals for local statutory health and wellbeing boards, which will bring together the key NHS, public health and social care leaders in each local authority area to work in partnership. The health and wellbeing board would be able establish a shared local view about the needs of the community and support joint commissioning of NHS, social care and public health services in order to meet the needs of the whole local population effectively. Responses to the consultation have been generally very supportive of local statutory health and wellbeing boards, with a desire to see clarity of accountability in the system between local authorities, GP consortia and the NHSCB. Local government and the NHS have also wanted to see close partnership working and joined-up commissioning strategies between the NHS and local authorities. The Department of Health is taking these views into account in developing final proposals and will shortly publish the full consultation response.

4.11 However, we can confirm that we will put forward detailed proposals for the establishment of health and wellbeing boards in every upper-tier local authority. They will also have the flexibility to bring in the local expertise of district councils. There will be a proposed minimum membership of elected representatives, GP consortia, DsPH, Directors of Adult Social Services, Directors of Children's Services, local HealthWatch and, where appropriate, the participation of the NHSCB. Subject to legislation, these members will be required to be part of the board, and local areas will be able to expand membership to include local voluntary groups, clinicians and providers, where appropriate. GP consortia and local authorities, including DsPH, will each have an equal and explicit obligation to prepare the Joint Strategic Needs Assessment (JSNA), and to do so through the arrangements made by the health and wellbeing board.

4.12 The Department of Health has also proposed a new role for local government to encourage coherent commissioning strategies, promoting the development of integrated and joined up commissioning plans across the NHS, social care, public health and other local partners. Ultimately, this should deliver better health and wellbeing outcomes, better quality of care, and better value for money, with fewer overlaps or gaps in provision, and different services working sensibly together.

4.13 We envisage health and wellbeing boards developing joint health and wellbeing strategies, based on the assessment of need outlined in their JSNA, and including a consideration of how all the relevant commissioners can work together. It is expected that this local, joint health and wellbeing strategy will provide the overarching framework within which more detailed and specific commissioning plans for the NHS, social care, public health, and other services that the health and wellbeing board agrees to consider, are developed. We would encourage organisations to develop concise and high-level strategies setting out how they will

address the health and wellbeing needs of a community, rather than large, technical documents duplicating other plans. The joint health and wellbeing strategy would have to include consideration of whether existing flexibilities to pool budgets and joined-up commissioning can be used to deliver the strategy.

4.14 There is huge potential to meet people's needs more effectively and promote the best use of public resources through close working relationships between local authorities and the NHS, to further integrate health with adult social care, children's services (including education) and wider services, including disability services, housing, and criminal justice agencies. There will be sufficient flexibility in the legislative framework for health and wellbeing boards to go beyond their minimum statutory duties to promote joining-up of a much broader range of local services for the benefit of their local populations' health and wellbeing.

4.15 Many areas are developing their own locally agreed partnership arrangements, such as public service boards and Community Budgets, to support this kind of collaboration and agree shared outcomes that health, local government, the police and others will set out to achieve in partnership with local communities.

4.16 Local authorities are free to take joint approaches to public health where they think that is the best way to tackle health improvement challenges that extend beyond local areas. For example, in response to the consultation on the NHS White Paper, *Equity and Excellence: Liberating the NHS*, the Mayor of London has made the case for a city-wide approach in London. The Secretary of State has invited the Mayor and local authorities in London to develop proposals on how they can collectively work together to improve health in London – and is open to proposals for joint working in other areas of the country.

Local government: promoting public health

4.17 DsPH will be employed by local government and jointly appointed by the relevant local authority and Public Health England. They will be the strategic leaders for public health in local communities, working to achieve the best possible public health and wellbeing outcomes across the whole local population, in accordance with locally agreed priorities. They will be professionally accountable to the Chief Medical Officer (CMO) and part of the Public Health England professional network.

4.18 The DPH will be a public health professional, with the training, expertise and skills needed to enable them to meet both the leadership and technical requirements of the role. They would be expected to maintain their professional skills.

4.19 Subject to the passage of the Health and Social Care Bill, DsPH will be responsible for the health improvement functions of upper-tier and unitary authorities and will be required to prepare an annual report on the population's health. To meet these responsibilities, DsPH will need to discharge their functions in a number of ways, ranging from direct responsibility for achieving public health

outcomes to advising colleagues and partners on public health. They will need to be supported by a team with specific public health and commissioning expertise.

4.20 To be the most effective leaders possible of public health in their areas, DsPH will have a number of critical tasks, set out in more detail in the Annex, including:

- promoting health and wellbeing within local government;
- providing and using evidence relating to health and wellbeing;
- advising and supporting GP consortia on the population aspects of NHS services;
- developing an approach to improving health and wellbeing locally, including promoting equality and tackling health inequalities;
- working closely with Public Health England health protection units (HPUs) to provide health protection as directed by the Secretary of State for Health; and
- collaborating with local partners on improving health and wellbeing, including GP consortia, other local DsPH, local businesses and others.

4.21 There are various models for how effective public health services can be delivered, and it should be determined locally as to how particular areas make their arrangements.

4.22 To make a reality of localism and local democracy, local government must have the freedom to decide what action is needed to take in order to shape their environments. For example, local planning authorities already have the ability to regulate the development of new fast food restaurants, and to impose conditions on such development, for example, to specify the operating hours. In addition, the proposed new 'general power of competence' will provide them with much greater freedom and flexibility to act in the interest of their communities.

4.23 These freedoms open up opportunities for local government to take innovative approaches to public health by involving new partners. We will encourage local authorities who may want to contract for services with a wide range of providers across the public, private and voluntary sectors and to incentivise and reward those organisations to deliver the best outcomes for their population. The forthcoming consultation on funding and commissioning in public health will explore how this would best be achieved. As part of building capable and confident communities, areas may wish to consider grant funding for local communities to take ownership of some highly focused preventive activities, such as volunteering peer support, befriending and social networks.

4.24 The Department of Health expects that the majority of services will be commissioned, given the opportunities this would bring to engage local communities more widely in the provision of public health, to deliver best value and best results. It also expects that local people will have access to information about commissioning decisions and how public health money is being spent.

4.25 Such efforts will be supported by the proposed new right for communities to bid to take over local state-run services, and the new Big Society Bank, which will lever in new social investment for charities and social enterprises, helping to create an environment in which innovative approaches to social investment and social enterprise flourish.

4.26 The following sections outline the proposed funding and commissioning arrangements and the outcomes framework for public health, and how these relate to Public Health England. Further detail will be set out in the forthcoming consultation documents.

Funding and commissioning for public health

4.27 The Department of Health will shortly publish a consultation following this White Paper on the details of the proposed funding and commissioning routes for public health. This consultation includes the funding and commissioning remit that the Department proposes for Public Health England in the future. We welcome views on the proposals.

National public health budget

4.28 The new system will be funded by a new public health budget, which will be ring-fenced within the overall NHS budget. The Department will work to ensure that funding for public health is not squeezed by other pressures, for example NHS finances, although it will still be subject to the running-cost reductions and efficiency gains that will be required across the system.

4.29 The Government announced in the Spending Review that total NHS spending would grow cumulatively in cash terms by 10.3% by 2014/15. Early estimates suggest that current spend on areas that are likely to be the responsibility of Public Health England could be over £4 billion. This estimate will be revised as the detailed design of Public Health England develops and we gather more information about existing services and spend.

4.30 Determining the baseline spend on the relevant areas is the first step in establishing the future public health budget, wherever possible taking account of any disruption caused by the transition to new NHS structures.

Local public health budget

4.31 Public Health England will allocate ring-fenced budgets, weighted for inequalities, to upper-tier and unitary authorities in local government for improving the health and wellbeing of local populations. The ring-fenced budgets will fund both improving population health and wellbeing, and some non-discretionary services, such as open-access sexual health services and certain immunisations. There will be scope, as now, to pool budgets locally in order to support public health work.

4.32 To incentivise action to reduce health inequalities we will introduce a new health premium, which will apply to the part of the local public health budget which is for health improvement. Building on a baseline allocation that is weighted towards areas with the worst health outcomes and most need, local authorities will receive an incentive payment, or premium, for these services that depends on the progress made in improving the health of the local population, based on elements of the proposed outcomes framework.

4.33 The premium will be simple and driven by a formula developed with key partners. Disadvantaged areas will see a greater premium if they make progress, recognising that they face the greatest challenges.

4.34 The health premium will be funded from within the overall public health budget. Potentially, an area that makes no progress might receive no growth in funding for these services. We intend the support for progress in reducing health inequalities to be clear and significant.

4.35 The forthcoming consultation document will discuss further some of the issues we will need to consider when developing the health premium, to allow more detailed discussions with local authorities and public health professionals. We will only set out a detailed model when we have established the baseline and potential scale of the premium clearly, and have agreement about the outcomes we will use.

4.36 The Department of Health will ask the independent Advisory Committee on Resource Allocation (ACRA) to support the detailed development of its approach to allocating resources to local authorities.

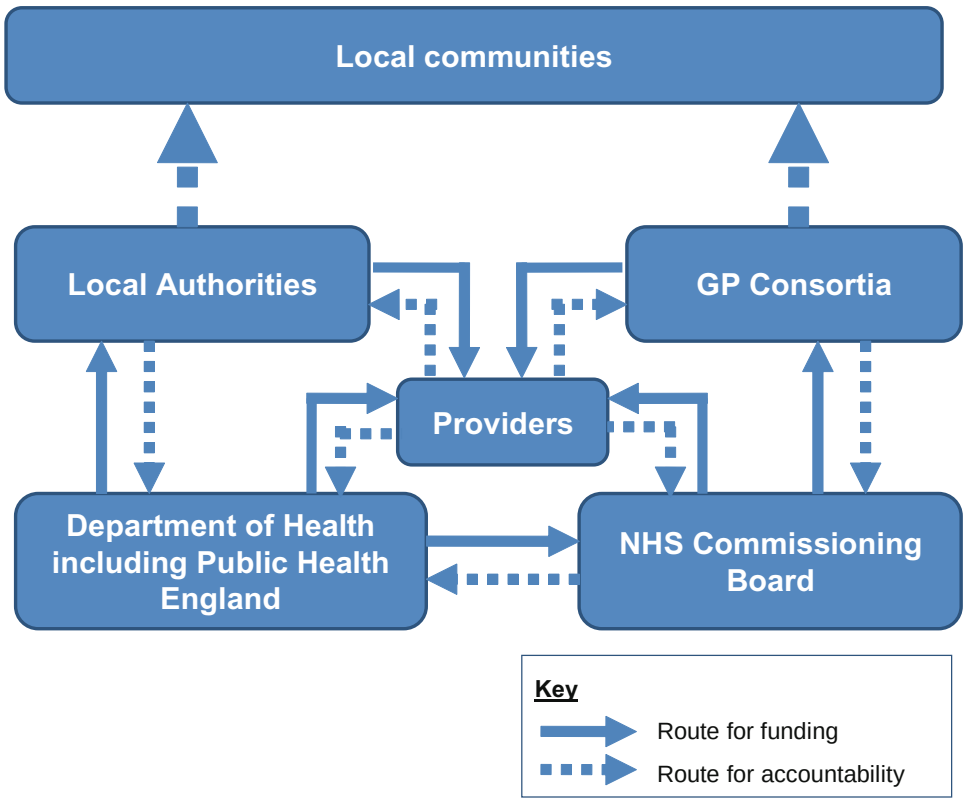
4.37 The public health grant to local authorities will be made under section 31 of the Local Government Act 2003. As a ring-fenced grant, it will carry some conditions about how the budget is to be used. However, we will seek to enable flexibility for local areas to determine how best they can use this funding to improve the health and wellbeing of their community.

4.38 There will be ‘shadow’ allocations to local authorities for each local area for this budget in 2012/13, providing an opportunity for planning before allocations are introduced in 2013/14. During the transitional year, 2011/12, the forthcoming NHS Operating Framework for 2011/12 will set out the operational arrangements

to manage the transition and will continue to signal the importance of NHS action on health improvement, health protection, preventing ill health and improving wellbeing. The NHS Operating Framework will set the context for the running-cost reductions and efficiency gains required across the system.

Commissioning of public health services

4.39 Public Health England will fund those services that contribute to health and wellbeing primarily by prevention rather than treatment aimed at cure. It will do so in a way that takes account of and addresses the needs of the whole population, including all protected characteristics as set out in the Equality Act 2010 (i.e. age, disability, gender reassignment, race, religion or belief, sex, sexual orientation, marriage and civil partnership, pregnancy and maternity).



4.40 Using these criteria, we propose that Public Health England should be responsible for funding and ensuring the provision of services such as health protection, emergency preparedness, recovery from drug dependency, sexual health, immunisation programmes, alcohol prevention, obesity, smoking cessation, nutrition, health checks, screening, child health promotion including those led by health visiting and school nursing, and some elements of the GP contract (including the Quality and Outcomes Framework (QOF)) such as those relating to immunisation, contraception, and dental public health. Full proposals will be set out in the forthcoming consultation document.

4.41 Public Health England will have three principal routes for funding services:

- granting the public health ring-fenced budget to local government;
- asking the NHSCB to commission services, such as screening services, and the relevant elements of the GP contract; and
- commissioning or providing services directly, for example national purchasing of vaccines, national communication campaigns, or health protection functions currently conducted by the Health Protection Agency (HPA).

4.42 These are not exclusive; for example, if appropriate, there may be an option for GP consortia to commission on behalf of Public Health England. Figure 4.1 gives an overview of the three principal routes for commissioning public health services in the future. For simplicity, this diagram only considers major routes of funding and accountability, and does not include, for example, funding to local authorities from other government departments.

Figure 4.1: Funding and accountability through the public health system

For further details and consultation questions, see the forthcoming consultation on funding and commissioning of public health.

4.43 Given the crucial role that early years development plays in setting up children for a healthy life, health visiting, school nursing and the child health promotion services they lead, in particular the Healthy Child Programme, will be funded from the Public Health England budget. In the first instance, the Department of Health and then the NHSCB will lead the commissioning of health visiting services on behalf of Public Health England, to oversee the workforce growth needed to meet the Coalition commitment to a further 4,200 health visitors. The NHSCB will work closely with PCTs, GP consortia and their local partners. It will be important to ensure that local mechanisms such as the proposed statutory local health and wellbeing board and the JSNA are used to enable high-quality public health input into the commissioning of health visiting services. These will help to strengthen and maintain the critical links with other services such as local authority commissioned early years' services like children's centres, as well as with other NHS services such as maternity and primary care. In the longer term, we expect health visiting to be commissioned locally. These changes to commissioning do not affect the employment arrangements for health visitors being taken forward under Transforming Community Services. The Department of Health will publish a plan setting out how this commitment will be taken forward over the next five years.

Public health outcomes framework

4.44 Chapter 2 set out the purpose and proposed outline for the new public health outcomes framework, which will be complementary to those for the NHS and social care and which will drive improvements in public health throughout the new system. It will set out a high-level vision and outcomes, along with a number of possible indicators across five domains, reflecting the breadth of Public Health England's mission. To enable transparency and accountability, outcomes will be published nationally and, where possible, locally.

4.45 The Department of Health has been working closely with partners to develop proposals for a public health outcomes framework. We will publish a consultation on this shortly. We welcome your views on this.

For further details and consultation questions, see the forthcoming consultation on the proposed public health outcomes framework.

National-level partnership with the NHS

4.46 The NHS has a crucial continuing role to play in public health. This includes ensuring that health services meet the needs of the whole population, including disadvantaged groups, taking every opportunity that health services have to prevent illness and promote health, and playing a critical part in preparing for and responding to emergencies.

4.47 The work of Public Health England will also benefit the NHS, by reducing pressures from avoidable illnesses and allowing the NHS to focus its efforts elsewhere. If Public Health England can help to reduce obesity, for example, we should see lower levels of diabetes and liver disease. By reducing the number of people who smoke, the NHS should not need to keep spending £2.7 billion a year on treating smoking related illness.[103] The QIPP (Quality, Innovation, Productivity and Prevention) programme was initiated and is driven by the NHS and includes savings from prevention such as smoking cessation and reducing alcohol harm.

4.48 There will need to be close partnership working between Public Health England and the NHS at a national level. The NHS role will be embedded in the mandate that the Secretary of State sets for the NHSCB. Public Health England will be able to advise and support the wider Department of Health and the NHS nationally in this role, to ensure that health services meet the needs of the whole population.

4.49 The Coalition agreement *The Coalition: our programme for government*[104] announced that the Department of Health will strengthen the role and incentives for GPs and GP practices on preventive services – both as primary care professionals and as commissioners. As primary care professionals, GPs and GP practices play a critical role in both primary and secondary care prevention. They have huge opportunities to provide advice, brief interventions and referral to targeted services through the millions of contacts they have with patients each year.

4.50 As NHS commissioners, GP consortia will have responsibility for the whole population in their area, including registered patients, unregistered citizens and visitors requiring urgent care. This should encourage them to work with local authorities and a diverse range of clinicians, including nurses, midwives, health visitors, allied health professionals, pharmacists and dentists, to improve the health of the local population as a whole.

4.51 The Department of Health will work to strengthen the public health role of GPs in the following ways:

- Public Health England and the NHSCB will work together to support and encourage GP consortia to maximise their impact on improving population health and reducing health inequalities. This will include looking specifically at equitable access to services and outcomes.
- Information on achievement by practices will be available publicly, supporting people to choose their GP practice based on performance. By increasing transparency about how effective different GP practices are in giving public health advice, Public Health England will enable local communities to challenge GPs to enhance their performance.
- Incentives and drivers for GP-led activity will be designed with public health concerns in mind, for example, in terms of prevention-related measures in the QOF. To increase the incentives for GP practices to improve the health of their patients, the Department proposes that a sum at least equivalent to 15% of the current value of the QOF should be devoted to evidence-based public health and primary prevention indicators from 2013. The funding for this element of QOF will be within the Public Health England budget.
- Public Health England will strengthen the focus on public health issues in the education and training of GPs, as part of the Department of Health's development of a workforce strategy.

Consultation question: Role of GPs and GP practices in public health

a. Are there additional ways in which we can ensure that GPs and GP practices will continue to play a key role in areas for which Public Health England will take responsibility?

4.52 Community pharmacies are a valuable and trusted public health resource. With millions of contacts with the public each day, there is real potential to use community pharmacy teams more effectively to improve health and wellbeing and reduce health inequalities. Public Health England will influence development of the community pharmacy contractual framework through the NHSCB. Alongside identifying strategic health needs through JSNAs, local authorities, through

proposed health and wellbeing boards, will have responsibility for producing pharmaceutical needs assessments, which will inform the commissioning of community pharmacy services by the NHSCB and local public health commissioning decisions. We will build on this as we establish the new system, with the Chief Pharmaceutical Officer working closely with the public health community. This will include the role of pharmacies as local businesses and employers.

4.53 The dental public health workforce will increase its focus on effective health promotion and prevention of oral disease, provision of evidence-based oral care and effective dental clinical governance. It will concentrate particularly on improving children's oral health, because those who have healthy teeth in childhood have every chance of keeping good oral health throughout their lives. It will also make a vital contribution to implementation of a new contract for primary care dentistry, which the Government is to introduce to increase emphasis on prevention while meeting patients' treatment needs more effectively.

National leadership and responsibilities

4.54 As the Department of Health is freed from the operational management of the NHS, it will refocus efforts on protecting and improving the health and wellbeing of England as a whole. Enhanced central powers will only be taken where absolutely necessary – this includes new powers for the Secretary of State to protect the population's health and to prepare for and respond to health threats that people and communities cannot tackle alone.

4.55 Within and beyond government, the Secretary of State for Health will do what needs to be done to protect health from external threats, will tackle the wider determinants of health and wellbeing, and will support local public health efforts.

4.56 The Secretary of State for Health's role will include:

- accounting to Parliament and the public for the Government's public health activities and spending;
- ensuring that the overall health and care system works coherently to deliver better health and wellbeing, better care and better value for the population and to address health inequalities;
- setting a ring-fenced budget for public health from within the overall NHS budget;
- setting the direction for Public Health England and the context for local public health efforts, through the public health outcomes framework;
- leading public health across central government, through the Cabinet Sub-Committee on Public Health;

- leading public health work across civil society and with business and brokering partnerships at national level with industry and the voluntary and community sectors to help drive behavioural change;
- participating in public health work across the UK with the Devolved Administrations and at European and international levels;
- proposing legislation where this is a necessary and appropriate response; and
- commissioning research for public health through the NIHR.

4.57 The CMO will have a central role in providing independent advice to the Secretary of State for Health and the Government on the population's health. He or she will be the leading advocate for public health within, across and beyond government, challenging industry, employers, and civil society to take a bigger role in and responsibility for the public's health. As convener and chair of a proposed new public health system advisory board, the CMO will bring together key partners to collaborate to improve and protect the public's health. The CMO will help to shape the role and expectations of local DsPH who will be professionally accountable to the CMO. The CMO will also lead a professional network for Public Health England.

4.58 On a wider front, the CMO will be expected to produce for publication an annual report 'On the State of the Public's Health', increasing transparency about the progress within public health, and helping to drive forward improvement across England. The CMO will also represent the UK internationally on public health issues.

A new streamlined Public Health England

4.59 For the first time ever, there will be a dedicated and professional public health service, Public Health England, with a mission across the whole of public health – protecting the public from health threats, improving the healthy life expectancy and wellbeing of the population, and improving the health of the poorest, fastest. It will work closely with the NHS to ensure that health services play a strong part in this mission, and it will support them in that task. It will bring together public health functions that are carried out in different parts of the system at present into a new, streamlined whole so as to remove duplication and drive efficiencies and innovation.

4.60 Public Health England will be part of the Department of Health, accountable to the Secretary of State for Health. It will not be a separate legal entity. Subject to the passage of the Health and Social Care Bill, it will include the current functions of the HPA and the NTA, which will become functions of the Secretary of State for Health. This will enhance the role of the Secretary of State for Health in health protection and will create an integrated system without artificial boundaries, or separate boards and accountabilities.

4.61 Public Health England will also include elements of public health activity currently held within the Department of Health and within strategic health authorities (SHAs) along with functions of the Public Health Observatories and cancer registries. It will work with local government, the NHS, other government agencies and other partners as necessary in preparing for and responding to emergency threats and in building partnerships for health.

4.62 Public Health England will be subject to the planned reduction of one-third of non-frontline administration costs across the whole system, while protecting frontline services. This will be managed within the overall human resources and financial framework of the Department of Health as part of its transition programme. The Department of Health will also set up an appropriate mechanism to ensure that the income generation activities of the HPA can be maintained.

4.63 Public Health England will have functions that need to be organised and aggregated at different levels to achieve maximum efficiency rather than the present mandated regional structure. In particular, managing health protection, especially emergency preparedness, will require strong links between Public Health England and the NHS, local government and others throughout the country. For example, infectious disease outbreaks often spread beyond the boundaries of a single local area, requiring co-ordinated management. Public Health England will therefore have an important local presence in the form of Health Protection Units (HPUs), working closely as now with the NHS and local government colleagues. Further details of this role are set out later in this chapter.

4.64 Public Health England's role will include:

- providing public health advice, evidence and expertise to the Secretary of State and the wider system, including working with partners to gather and disseminate examples of what works;
- delivering effective health protection services;
- commissioning or providing national-level health improvement services, including appropriate information and behaviour change campaigns;
- jointly appointing DsPH and supporting them through professional accountability arrangements;
- allocating ring-fenced funding to local government and rewarding them for progress made against elements of the proposed public health outcomes framework;
- commissioning some public health services from the NHS, for example via the NHSCB; and
- contributing internationally-leading science to the UK and globally, in areas such as biological standards and control, dangerous pathogens, and incident response.

4.65 Public Health England will maintain the principles and practice of independent scientific and public health advice, which are essential to maintain public and professional confidence and transparency. It will maintain a source of independent expert advice, including through a structure of Expert Committees, which will continue to operate according to the Government's Chief Scientific Adviser's guidance. Statistical publications will follow established procedures for release of official statistics. It will use the best available science as the basis for advice to the population, health professionals and others, for example in responding to incidents.

4.66 As is the case today, the NHS Constitution will continue to apply to the whole health service, whether the NHS or Public Health England. There is a wider social duty to promote equality through the services provided by the NHS and Public Health England, paying particular attention to groups or sections of society where improvement in health and life expectancy are not keeping pace with the rest of the population.

4.67 The Department of Health will work closely with the Devolved Administrations on UK-wide issues wherever appropriate, such as for biological standards and radiological protection. EU negotiations are conducted for the UK as a whole, and the Department of Health will carry these out in close consultation with the Devolved Administrations.

Enhanced protection for health

Emergency preparedness and response

4.68 The Government will devolve public health leadership wherever possible, but will keep powers and strengthen them where there is a strong case for central leadership. Preparing for and tackling emergencies to protect the population from events from which they cannot protect themselves is a core role that national government should perform.

4.69 Public Health England will build on the current arrangements for emergency preparedness, resilience and response. There will be a robust new system underpinned by powers held by the Secretary of State for Health, with streamlined Public Health England functions and assurance.

4.70 Public Health England and the NHS need to plan, prepare and be able to respond to a range of disruptive challenges – such as terrorism, infectious disease outbreaks, chemical, biological, radiological and nuclear incidents, and the health impacts of climate change – in a co-ordinated and effective way both nationally and locally.

4.71 Public Health England will bring together the health protection and emergency planning and response functions from the Department of Health, the HPA and SHAs. These functions will provide a high level of scientific expertise, available to all parts of Public Health England, to the NHS, to multi-agency partners, and to central and local government.

4.72 At a national level, the Secretary of State of Health will have powers of direction in the event of what he considers to be an emergency, including powers to direct NHS providers as to how they should respond. The Secretary of State will be able to delegate powers of direction over NHS providers to the NHSCB, which will be responsible for assuring NHS preparedness and resilience, by assuring that clear arrangements are in place, services are co-ordinated and there are designated lead individuals. In the event of an emergency, the NHSCB will have responsibility for mobilising the NHS.

4.73 In the response phase, there will be national leadership, with most incidents managed locally by the Public Health England HPUs and local DsPH working together. Public Health England and the NHS will be part of the multi-agency local response, and it will be important that they plan and respond together.

4.74 The Department of Health will ensure that capacity for emergency preparedness and response is maintained throughout the transition to these new arrangements.

Health protection services

4.75 Health protection is concerned with infectious and environmental hazards (including radiation, chemicals, poisons, air pollution and the health effects of climate change) that affect people often in circumstances that are not easily avoidable.

4.76 In addition to emergency preparedness and response, a range of health protection functions are best done at a national level to ensure that the Government is protecting the population from threats. Public Health England will:

- provide a coherent, accountable national framework for rapid responses to threats;
- act in co-ordination across government and with other national partners in response to public health threats;
- provide evidence-gathering and surveillance functions, supported by scientific expertise;
- provide information and independent advice on hazards to health to professionals and the public;
- provide specialist and reference microbiology functions;

- set the standards for the national immunisation programme, advised by the independent Joint Committee on Vaccinations and Immunisations, and centrally procure many vaccines;
- commission communication campaigns where needed; and
- respond to legislative requirements including those set by the EU such as on emission levels.

4.77 Local government already works hard to protect health, for example, with environmental health officers playing a vital role during infectious disease outbreaks. In addition, the HPA has HPUs sited around the country. These are front-line delivery units, which include specialist public health and clinical staff, and provide the critical response to incidents, alongside monitoring and surveillance to protect the public's health. In the future, Public Health England will continue to work closely with local government in delivering health protection through HPUs.

Evidence for public health

4.78 In light of the Government's commitment to doing what works, Public Health England will promote information-led, knowledge-driven public health interventions – supporting national and local public health efforts. The Department of Health will develop an evidence-based approach to public health alongside an evidence-based approach to healthcare. As the Government considers the challenges of the future, it will need to develop and enhance the public health evidence base. It will champion new approaches such as those offered by behavioural science, and develop and provide clear, practical evidence on how to influence the wider determinants of health.

4.79 Public Health England offers a unique opportunity to draw together the existing complex information, intelligence and surveillance functions performed by multiple organisations into a more coherent form and to make evidence more easily available to those who will use it, in a form that makes it most likely to be used.

4.80 Local requirements for public health evidence will drive Public Health England's evidence function, ensuring it is responsive to local needs and accessible to users across the country. DsPH, front-line teams, commissioners of NHS and public health services, public and patient representatives and wider partners will all benefit from enhanced public health evidence. By ensuring a strong central information and intelligence function, Public Health England will support the specialist workforce required to meet local requirements effectively and efficiently.

4.81 Public health practitioners from all sectors, including healthcare, the voluntary and community sector, and academia, will be critical in developing innovative and structured approaches, enabling evaluation and sharing the evidence from evaluation, thus driving the agenda for public health evidence development.

4.82 The best way to ensure that the new system is effective and cost-efficient in its approach to public health is by providing people with transparent information on the cost, the evidence-base and, ultimately, the impact of services. The new system, particularly Public Health England and local government, will provide information to the public about how taxpayers' money is being used and the outcomes it is achieving.

4.83 Public Health England's approach to evidence will be based on three principles:

- quality – evidence will be timely, reliable, relevant to the audience and aim, and produced in a scientifically robust and independent way;
- transparency – evidence will be as accessible and user-friendly as possible, driving accountability through increased availability of information. This will be in line with the Government's commitment to create a new 'right to data' so that government-held datasets can be requested and used by the public, underpinned by the Transparency Board's Public Data Principles;[105] and
- efficiency – information will be collected once but used many times and new knowledge will be rapidly applied as it becomes available.

Research

4.84 Public health evaluation and research will be critical in enabling public health practice to develop into the future and address key challenges and opportunities, such as how to handle the wider determinants of health and how to use behaviour change science to support better practice. At the basis of this is the need to try new ideas and innovate in a structured manner.

4.85 The NIHR will continue to take responsibility for the commissioning of public health research on behalf of the Department of Health, working with partners whose actions affect public health. Public Health England will work closely with the NIHR in identifying research priorities. To further develop public health research the Department will:

- establish an NIHR School for Public Health Research – conducting high-quality research to increase the evidence base for effective public health practice. This school will draw on leading academic centres with excellence in applied public health research and evaluations and place emphasis on what works practically and can be applied across the whole country;

- continue to promote a public health focus within the NIHR and fund, from within the Department's Policy Research Programme, a new Policy Research Unit on Behaviour and Health; and
- ensure that Public Health England provides the necessary resource to support the cost of public health interventions that are undergoing research outside of the NHS.

Information and intelligence

4.86 As the Department of Health designs and develops the future public health system, it will continue working closely with the full range of public health partners involved in surveillance, monitoring, evaluation and intelligence in order to develop a clear approach for information and intelligence. In the coming year, the Department will focus on drawing together existing public health information and intelligence functions (for example, the Public Health Observatories, cancer registries, and relevant parts of the HPA), working to eliminate gaps and overlaps and to develop the specialist workforce required.

4.87 Once established, Public Health England will:

- strengthen public health surveillance by ensuring fit-for-purpose data collection and analysis of health outcomes, providing early warning of problems and enabling a rapid and effective public health response;
- work with and measure the impact of different communications channels, including NHS Choices, to ensure that we provide a single, trusted source of information during public health emergencies, as well as supporting individuals to make informed lifestyle choices;
- ensure that the National Institute for Health and Clinical Excellence (NICE) adds maximum value by providing authoritative, independent advice on the evidence of effectiveness and cost effectiveness for public health interventions, working to specific commissions from Public Health England; and
- develop intelligence about the relative cost effectiveness of different interventions to support DsPH in commissioning local services, building on the work already started by NICE.[106]

4.88 The Department wants to consult those interested in public health practice on the best way of developing public health evidence in the future, with particular interest in comments on the following proposals:

- publishing an annual review of the latest evidence on what works best in achieving better public health outcomes;

- developing a single, accessible and authoritative web-based evidence system for professionals, particularly DsPH, to make evidence easily available to all and to encourage the use of the best evidence in practice; and
- encouraging recognition and peer-sharing of successful innovative evidence-based approaches.

Consultation questions: Public health evidence

b. What are the best opportunities to develop and enhance the availability, accessibility and utility of public health information and intelligence?

c. How can Public Health England address current gaps such as using the insights of behavioural science, tackling wider determinants of health, achieving cost effectiveness and tackling inequalities?

d. What can wider partners nationally and locally contribute to improving the use of evidence in public health?

Workforce for public health

4.89 The Government wants to build on the achievements and skills of the current public health workforce. Maintaining a well-trained, highly motivated public health workforce will be critical to the success of the public health system.

Our vision for the public health workforce

We envisage that the public health workforce will be known for its:

- expertise – public health staff, whatever their discipline and wherever they work, will be well-trained and expert in their field, committed to developing and maintaining that expertise and using an evidence-based approach to practice;
- professionalism – they will demonstrate the highest standards of professional conduct in their work;
- commitment to the population's health and wellbeing – in everything they do, they will focus on improving and protecting the health and wellbeing of their populations, taking account of equality and rights, whether it be a DPH in a local authority, an infection control nurse in an acute trust or a microbiologist within Public Health England; and
- flexibility – they will work effectively and in partnership across organisational boundaries.

4.90 Our vision for the future public health workforce is set out above. A more detailed workforce strategy to support this will be developed by autumn 2011, working with representative organisations. This will support a smooth and effective transition, informed by the views of people on the frontline of public health delivery.

4.91 The workforce strategy will set out how a supply of highly trained and motivated staff, with the appropriate skills for understanding the range of public health interventions, providing public health advice and commissioning the services communities require, can be sustained and grown, as needed.

4.92 In the future, a range of public health staff will work in Public Health England, employed by the Department of Health. These will include staff employed by the HPA, the NTA and the Department of Health.

4.93 Many critical roles in public health are played by people who will not be employed by Public Health England, but who will be part of a wider professional network. A very wide range of clinicians and other professionals – from GPs to dentists, pharmacists to nurses, allied health professionals to environmental health officers – have essential roles to play in improving and protecting population health and reducing health inequalities.

4.94 After completion of Transforming Community Services in April 2011, the provider functions of PCTs will have moved to other organisations, including community foundation trusts and social enterprises. As set out in *Excellence and Equity: Liberating the NHS* (2010), there will be a move to 'any willing provider' for community services to improve choice and access for local people. This White Paper does not change the direction of travel for local community services.

4.95 It is critical that scarce public health skills within the system are retained, including capacity to support senior leadership of the public health service. The Department of Health will therefore encourage PCTs and local government to discuss the future shape of public health locally. It is important to ensure that specialist staff, including medical and clinical staff, are rewarded fairly wherever they work; that their pay is properly governed locally; and that reasonable arrangements are in place to promote the flexibility and mobility of the workforce in the longer term. The Department of Health will work with the Local Government Association to consider what advice, support and guidance may be needed to support this. The Department will ensure that the human resources framework being developed with trade unions specifically addresses the development of Public Health England.

4.96 Alongside *Healthy Lives, Healthy People*, the Department of Health is publishing a review by Dr Gabriel Scally of the regulation of public health professionals. As the Government believes that statutory regulation should be a last resort, its preferred approach is to ensure effective and independently-assured voluntary regulation for any unregulated public health specialists. As professional regulation is a devolved matter, we will be consulting in all parts of the United Kingdom on this issue.

4.97 For other public health practitioners, the Department of Health will discuss with relevant groups the arrangements for setting and sustaining high standards of practice.

Consultation question: Regulation of public health professionals

e. We would welcome views on Dr Gabriel Scally's report. If we were to pursue voluntary registration, which organisation would be best suited to provide a system of voluntary regulation for public health specialists?

4.98 The Government will consult separately on proposals for a new framework for education and training for all clinical and healthcare professionals. The consultation will be based on the principle that the system should be focused on patient needs, driven by healthcare provider decisions and underpinned by strong clinical leadership. In designing a new system for the health sector, it will be important to ensure that there is alignment with the evolving Public Health England.

Conclusion

4.99 This new system – with localism at its heart, backed by national action where needed – will address the problems of the past and set England up to tackle the public health challenges of the future. We welcome views on the questions set out in this chapter during the consultation period. The following chapter sets out the consultation process, along with our proposed transition to the new system.

5. Making it happen

Summary

Subject to the passage of the Health and Social Care Bill, the Government plans to:

- **enable the creation of Public Health England, which will take on full responsibilities from 2012, including the formal transfer of functions and powers from the Health Protection Agency (HPA) and the National Treatment Agency for Substance Misuse (NTA);**
- **transfer local health improvement functions to local government, with ring-fenced funding allocated to local government from April 2013; and**
- **give local government new functions to increase local accountability and support integration and partnership working across social care, the NHS and public health.**

The transition to Public Health England will be developed in alignment with changes to primary care trusts (PCTs) and strategic health authorities (SHAs), and the creation of the NHS Commissioning Board (NHSCB). The detailed arrangements will be set out in a series of planning letters throughout the course of 2011.

A number of consultation questions are summarised in this chapter, and we would welcome your views on these questions. The consultation on these questions closes on 8 March 2011.

The Department of Health has published a review of the regulation of public health professionals by Dr Gabriel Scally. A consultation question about this is in Chapter 4 of this White Paper. We would welcome views on this report.

Forthcoming consultation documents will set out the proposed public health outcomes framework, and funding and commissioning arrangements for public health responsibilities.

5.1 This White Paper sets out the Government's strategy in the current Parliamentary term and beyond. This chapter sets out proposals for the transition to the new public health system in the context of wider changes to the health and social care system. It describes a phased approach that draws a clear distinction between the 'new' and the 'old', so that accountabilities and responsibilities are defined, enabling management teams to be put in place to build and prepare their organisations in advance of implementation, and to provide leadership across the system during transition.

5.2 As outlined in *Equity and Excellence: Liberating the NHS*, primary legislation will support the creation of Public Health England. The forthcoming Health and Social Care Bill will include these necessary reforms.

5.3 Much work now needs to be undertaken, both to manage the transition over the next two to three years, ensuring that the system continues to deliver a high-quality and safe service, and to develop the detail of the new system. This will be done alongside transition in other parts of the health and care sector, such as the creation of the NHSCB, GP consortia and proposed local statutory health and wellbeing boards.

5.4 The Department of Health will ensure that the system is robust and financially sustainable through the transition, as well as in the longer term. The effective management of health protection and emergency preparedness and response, as well as financial risk, will be of particular importance. The costs of transition and all the costs of policy commitments in this White Paper will be met within Departmental spending review allocations.

The transition to a new public health system

By early 2011

5.5 We will set out more detail on the proposed shape and structure of the new health and care system and our proposals for managing the transition in a series of publications in the coming months. These include:

- a detailed roadmap for the system as a whole – the NHS, Public Health England and the Department of Health – setting out the key transition milestones, expectations and activities for the years ahead;

- further detail on the public health system, based on our responses to the consultation in this White Paper and forthcoming consultations on funding and commissioning for public health and on the public health outcomes framework;
- human resources frameworks setting out the principles, expectations and approach for managing people moving between each of the organisations in the new health and care system;
- the Health and Social Care Bill, which will be introduced in Parliament following our response to the NHS White Paper consultations and will set out much greater detail on the structural and delivery implications of the system-wide reforms; and
- the NHS Operating Framework and the announcement of PCT allocations for 2011/12, which will be published in December 2010. These will set out expectations for the NHS during the first crucial transition year, including our expectations for public health delivery through PCTs.

5.6 The first step in determining budgets for public health will be to establish the baseline health spend on those services for which Public Health England will take responsibility in the future. Local PCT spending on such services during 2009/10 will be used as the baseline to reflect recent historic spending rather than spending during a transition year.

2011/12 – a year of transition

5.7 2011/12 will be a period of detailed policy and operational design, while transition to shadow bodies and planning for implementation take shape on the ground. We will continue to work closely with public health partners, local government and other stakeholders on the design of the new public health system throughout the passage of the Health and Social Care Bill and the consultation period for this White Paper and the forthcoming consultation documents.

5.8 There will be an overarching human resources framework with a common set of principles so that staff are treated fairly. One strand will cover all staff in the NHS affected by the changes set out in *Equity and Excellence: Liberating the NHS*. This will include all public health staff currently working in the NHS and those that will move to local authorities. Another strand will cover staff in the Department of Health. The third strand will cover staff in arm's-length bodies. The frameworks are designed to cover issues related to transfer and transition and the necessary functional support required by Public Health England as part of the Department of Health, including IT, communications, finance and estates.

5.9 In 2011, we will develop and consult on a public health workforce strategy, working with a wide range of employers and professional bodies and covering those who will form part of Public Health England and those with whom it will have close associations and wider professional networks.

5.10 Accountability for delivery in 2011/12 will continue to rest with SHAs and PCTs. In addition, SHAs will be responsible for the overall transition process in their regions during 2011/12. As part of this, Regional Directors of Public Health (RDsPH) will lead the transition for the public health system at the regional and local level.

5.11 The transition to Public Health England will be developed in alignment with changes to PCTs and SHAs, and the creation of the NHSCB. The detailed arrangements will be set out in a series of planning letters throughout the course of 2011.

2012/13 – consolidation

5.12 We envisage that Public Health England will come into being in April 2012 as an identifiable part of the Department of Health.

5.13 We will also publish shadow ring-fenced allocations for local authorities.

From April 2013 onwards

5.14 The new public health system will be in place. We will have implemented formal commissioning arrangements between Public Health England, the NHSCB, GP consortia and local authorities. The Department of Health will allocate ring-fenced budgets directly to upper-tier and unitary local authorities. Table 5.1 outlines the summary timetable.

Table 5.1: Summary timetable (subject to Parliamentary approval of legislation)	**Date**
Consultation on: • specific questions set out in this White Paper; • the public health outcomes framework; and • the funding and commissioning of public health.	Dec 2010–March 2011
Set up a shadow-form Public Health England within the Department of Health Start to set up working arrangements with local authorities, including the matching of PCT Directors of Public Health to local authority areas	During 2011
Develop the public health professional workforce strategy	Autumn 2011
Public Health England will take on full responsibilities, including the functions of the HPA and the NTA Publish shadow public health ring-fenced allocations to local authorities	April 2012
Grant ring-fenced allocations to local authorities	April 2013

Building on this White Paper

5.15 The Department of Health will publish a range of key documents throughout the year that link to this White Paper, including the following:

Winter 2010/11

- health visitors;
- mental health; and
- tobacco control.

Spring 2011

- Public Health Responsibility Deal;
- obesity;
- physical activity;
- social marketing;
- sexual health and teenage pregnancy; and
- pandemic flu.

Autumn 2011

- health protection, emergency preparedness and response.

5.16 Other government departments will also publish a range of documents that relate to public health and address the wider determinants of health, including:

- Child Poverty Strategy (HM Government);
- Drugs (HM Government);
- Public Services Reform White Paper (HM Government);
- Alcohol pricing and taxation (Her Majesty's Government);
- Crime Strategy (Home Office);
- Response to the consultation *Rebalancing the Licensing Act – on empowering individuals, families and local communities to shape and determine local licensing* (Home Office);
- Social Mobility White Paper (Cabinet Office);
- Welfare White Paper (Department for Work and Pensions);

- Special Educational Needs and Disability Green Paper (Department for Education);
- Munroe Review of Child Protection (Department for Education);
- Graham Allen Early Intervention Review (Department for Education);
- Local Transport White Paper (Department for Transport);
- Road Safety Strategy (Department for Transport);
- Natural Environment White Paper (Department for Environment, Food and Rural Affairs);
- Sentencing and Rehabilitation Green Paper (Ministry of Justice); and
- Skills Strategy (Department for Business, Innovation and Skills).

Consultation and engagement

5.17 To support ownership of the new public health system, in addition to existing engagement activity, the Department of Health will take forward work in partnership with relevant organisations, seeking their help and expertise in developing proposals that work in practice.

5.18 We will consult on the detailed design of the outcomes and funding frameworks set out in forthcoming consultation documents. We are also consulting on the specific questions in this White Paper, which are summarised overleaf.

Consultation questions

a. **Role of GPs and GP practices in public health:** Are there additional ways in which we can ensure that GPs and GP practices will continue to play a key role in areas for which Public Health England will take responsibility?

b. **Public health evidence:** What are the best opportunities to develop and enhance the availability, accessibility and utility of public health information and intelligence?

c. **Public health evidence:** How can Public Health England address current gaps such as using the insights of behavioural science, tackling wider determinants of health, achieving cost effectiveness, and tackling inequalities?

d. **Public health evidence:** What can wider partners nationally and locally contribute to improving the use of evidence in public health?

e. **Regulation of public health professionals:** We would welcome views on Dr Gabriel Scally's report. If we were to pursue voluntary registration, which organisation would be best suited to provide a system of voluntary regulation for public health specialists?

Forthcoming consultation documents will set out questions on the proposed public health outcomes framework and the funding and commissioning of public health.

5.19 We will arrange a programme of consultation and policy development events around England. Details will be posted on the Department of Health website, as well as advertised through stakeholder networks.

5.20 Consultation on the specific questions in this White Paper closes on 8 March 2011. You can contribute to the consultation by providing written comments:

by email to: publichealthengland@dh.gsi.gov.uk

by post to: Public Health Consultation
Department of Health
Room G13, Wellington House
133–155 Waterloo Road
London SE1 8UG

The consultation process

Criteria for consultation

5.21 The consultation on the questions set out above follows the Government Code of Practice on consultation. In particular we aim to:

- formally consult at a stage where there is scope to influence the policy outcome;
- consult for at least 12 weeks and consider longer timescales where feasible and sensible;
- be clear about the consultation's process in the consultation documents, what is being proposed, the scope to influence and the expected costs and benefits of the proposals;
- ensure that the consultation exercise is designed to be accessible to, and clearly targeted at, those people it is intended to reach;
- keep the burden of consultation to a minimum to ensure that consultations are effective and to obtain consultees' buy-in to the process;
- analyse responses carefully and give clear feedback to participants following the consultation; and
- ensure that the officials running the consultations are guided in how to run an effective consultation exercise and share what they learn from the experience.

5.22 The full text of the Code of Practice is on the Better Regulation website at:

www.bis.gov.uk/policies/better-regulation/consultation-guidance

Comments on the consultation process itself

5.23 If you have concerns or comments that you would like to make relating specifically to the consultation process itself please contact:

Consultations Co-ordinator
Department of Health
3E48, Quarry House
Leeds LS2 7UE

email: consultations.co-ordinator@dh.gsi.gov.uk

Please do not send consultation responses to this address.

Confidentiality of information

5.24 We manage the information you provide in response to this consultation in accordance with the Department of Health's Information Charter.[107]

5.25 Information we receive, including personal information, may be published or disclosed in accordance with the access to information regimes (primarily the Freedom of Information Act 2000 (FOIA), the Data Protection Act 1998 (DPA) and the Environmental Information Regulations 2004).

5.26 If you want the information that you provide to be treated as confidential, please be aware that, under the FOIA, there is a statutory Code of Practice with which public authorities must comply and which deals, among other things, with obligations of confidence. In view of this, it would be helpful if you could explain to us why you regard the information you have provided as confidential. If we receive a request for disclosure of the information we will take full account of your explanation, but we cannot give an assurance that confidentiality can be maintained in all circumstances. An automatic confidentiality disclaimer generated by your IT system will not, of itself, be regarded as binding on the Department.

5.27 The Department will process your personal data in accordance with the DPA and, in most circumstances, this will mean that your personal data will not be disclosed to third parties.

Summary of the consultation

5.28 A summary of the response to the consultation questions in this White Paper and forthcoming consultations on the proposed public health outcomes framework and the funding and commissioning of public health will be made available before or alongside any further action (such as laying legislation before Parliament), and will be placed on the consultations website at:

www.dh.gov.uk/en/Consultations/Responsestoconsultations/index.htm

Annex: A vision of the role of the Director of Public Health

1. This Annex sets out a vision for the role of the Director of Public Health (DPH) developed in discussions between the Department of Health and public health professionals, local government and the NHS over recent months. DsPH have a critical leadership role in the new system – at the centre of improving the health and wellbeing of local communities across England.[i] This role is subject to passage of the Health and Social Care Bill.

Principal adviser

2. We envisage that the DPH will be the principal adviser on all health matters to the local authority, its elected members and officers, on the full range of local authority functions and their impact on the health of the local population, including identifying health inequalities and developing and implementing local strategies to reduce them.

3. He or she will be play a key role in the proposed new functions of local authorities in promoting integrated working; contribute to the development of the local Joint Strategic Needs Assessment (JSNA) and the joint health and wellbeing strategy; be an advocate for the public's health within the community; and produce an authoritative independent annual report on the health of their local population.

Provision and use of evidence

4. The DPH will be responsible for ensuring that the local authority, and its key partners, have access to the high-quality analysis and evidence needed to inform the JSNA, the Annual Health Report, emergency preparation and response, and all public health services for which they are responsible. In tight financial times, it will be incumbent only to support effective interventions that deliver proven benefits, and to evaluate innovative approaches.

Population healthcare

5. Although the DPH will be employed by local authorities, it will be vital to ensure a high-quality public health input into NHS services. DsPH will need to work closely with GPconsortia to help identify, prevent and manage a range of conditions, such as mental ill health, cardiovascular disease, diabetes and cancer, across the population, to support people to take care of their own health,

i This includes Service personnel, their families and veterans.

promoting independence, self-care and self-management. DsPH will also need to have input into commissioning services for people with established diseases and long-term conditions, supported by high-quality community services provided by a wide range of health professionals.

6. In addition to offering support to GP commissioners, the DPH will wish to engage in a range of regular informal and formal mechanisms for public health experts to advise other NHS colleagues. The DPH will work with NHS colleagues locally in:

   - advising on commissioning and effective operation of population health services;
   - ensuring the provision of services for diverse and potentially excluded groups (for example, people with mental health problems and with learning disabilities; the homeless; people in prisons and ex-offenders; children with special educational needs or disability and looked after children; and travellers);
   - advising on how to ensure equal access and equity of outcome across the population; and
   - working with and supporting health and social care colleagues to increase opportunities for using contacts with the public and service users to influence behaviours positively and thereby improve health.

Health protection and emergency preparedness and response

7. Where the Secretary of State enters into arrangements with local authorities in relation to health protection and emergency preparedness, we envisage that the DPH will play an important role in local emergency planning and response to public health threats that affect their communities. They will be supported in this by the Health Protection Units (HPUs), which will provide specialist advice and access to the national resources of the public health service.

8. DsPH will work closely with local HPUs across the full range of health protection issues and ensure they are appropriately reflected in the Annual Health Report and the JSNA and that co-ordinated action can be taken where necessary.

9. The ‘proper officer’ for the purposes of the Public Health (Control of Disease) Act 1984 will continue to be appointed by the local authority (at the lower tier in a two-tier regime).

10. Authorities (including port health authorities) will continue to provide health protection interventions according to existing legislation such as the Public Health (Control of Disease) Act 1984, Food Safety Act 1990, Environmental Protection Act 1990 and others.

11. DsPH and HPUs will contribute to Local Resilience Forums according to local need and expertise. DsPH will ensure that there are sufficient qualified and appropriately trained public health staff to maintain a robust and resilient on-call rota for major incidents, infectious disease outbreaks and port health at the local level.

12. DsPH and HPUs will work together to undertake local horizon scanning and risk management, health surveillance and, working with local partners, will develop plans and mitigation strategies for the threats and hazards that might affect health – supported by Public Health England as appropriate.

13. Local and National Resilience Forums will continue to play a vital role, working together with a range of organisations to ensure that we are prepared for and can respond to significant threats and emergencies.

Health improvement and inequalities

14. The DPH will be responsible for health improvement, addressing local inequalities in health outcomes, and addressing the wider determinants of health. He or she will work in partnership with other local government colleagues, and partners such as GP consortia, the wider NHS, early years services, schools, business, voluntary organisations and the police, to achieve better public health outcomes for the whole of their local population. This may also include working with other DsPH and Public Health England across a wider geographical area as appropriate. We would expect this to include personal public health services such as smoking cessation, alcohol brief interventions, weight management and work to address the wider determinants of health.

Accountability

15. DsPH will have a professional duty to keep their skills up to date and to ensure their staff are similarly well trained. This is to ensure there is a competent local multi-disciplinary public health workforce, with strong professional leadership at its heart.

16. The primary accountability for local government will be to their local populations through transparency of progress against outcomes and their local strategy. There will also be a relationship between Public Health England and local councils through the allocation of the ring-fenced budget, for which the Chief Executive will be the Accountable Officer; through transparency of progress against the outcomes framework; and through the incentives available to reward progress against health improvement outcomes.

17. DsPH will be jointly appointed by the relevant local authority and Public Health England.While councils will have the power to dismiss DsPHs for serious failings across the full spectrum of their responsibilities, the Secretary of State for Health will have the power to dismiss them for serious failings in the discharge of their health protection functions. They will be accountable to the Secretary of State for Health and professionally accountable to the Chief Medical Officer.

Glossary

Commissioning – the process of assessing the needs of a local population and putting in place services to meet those needs.

Devolved Administrations – refers to the governments of Scotland (the Scottish Government), Wales (the National Assembly for Wales) and Northern Ireland (the Northern Ireland Assembly).

Directors of Public Health (DsPH) – currently a role within NHS primary care trusts, moving to local authorities in the future; the lead public health professionals who focus on protecting and improving the health of the local population.

Health and Social Care Bill – proposals for a Health Bill were included in the Queen's Speech for the first Parliamentary session of the Coalition Government. The Health and Social Care Bill will bring forward the legislative changes required for the implementation of the proposals in this White Paper.

Health premium – a component of the new funding mechanism for public health that will reflect deprivation and reward progress against health improvement outcomes in local areas.

Health Protection Agency (HPA) – the current non-departmental public body responsible for a range of health protection functions.

Local authorities – see **Local government**, below.

Local government – refers collectively to administrative authorities for local areas within England, with different arrangements in different areas, including:

- two-tier authorities: several district councils ('lower-tier', responsible for, for example, council housing, leisure services, recycling, etc.) overlap with a single county council ('upper-tier', responsible for, for example, schools, social services and public transport);
- unitary: a single layer of administration responsible for local public services, including: metropolitan district councils; boroughs; and city, county or district councils;
- town and parish councils: cover a smaller area than district councils and are responsible for, for example, allotments, public toilets, parks and ponds, war memorials, local halls and community centres; and

- shared services: where it is considered appropriate, local government may share services across areas greater than individual administrative bodies, for example, for policing, fire services and public transport.

Local Resilience Forum – a multi-agency partnership in a local area of Category 1 Responders (for example, emergency services, local authorities and the NHS), as defined by the Civil Contingencies Act 2004, often working closely with Category 2 responders (for example, the Highways Agency and public utility companies); responsible for establishing and maintaining arrangements to respond to major emergencies.

National Institute for Health and Clinical Excellence (NICE) – an independent organisation which provides advice and guidelines on the cost and effectiveness of drugs and treatments.

National Treatment Agency for Substance Misuse (NTA) – current special health authority established to improve the availability, capacity and effectiveness of treatment for drug misuse in England.

NHS Constitution – describes the principles and values of the NHS in England, and the rights and responsibilities of patients, the public and staff.

NHS Operating Framework – sets out the priorities for the NHS, the business rules to support their delivery and the accountability process for each financial year.

Primary care trust (PCT) – the NHS body currently responsible for commissioning healthcare services – and, in most cases, providing community-based services such as district nursing – for a local area.

Provider – an organisation that provides services directly to patients, including hospitals, mental health services and ambulance services.

Public Health Observatories – existing organisations that serve the public health intelligence needs of different regions in England.

Spending Review – set out the Government's priorities, and spending plans to meet these priorities, for the period 2011/12–2014/15.

Strategic health authorities (SHAs) – the 10 public bodies which currently oversee the commissioning and provision of NHS services at a regional level.

Unitary authority – see **Local government**, above.

Upper-tier authority –see **Local government**, above.

Note:

This document is intended for social marketing and communications professionals working within the Department of Health and Public Health England, the NHS, local authorities, the COI and appointed agencies as well as policy colleagues across government, public health professionals and other interested parties.

We have tried to avoid the use of marketing terminology but this has not always been possible.

A glossary of common marketing terms is included in the appendices.

Foreword

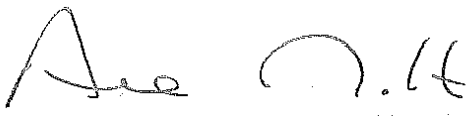
When asked what is important to us, most of us put our health either at the top or very close to the top of our list[1]. Good health ranks alongside friendships and family, as something that we feel we *need* to function fully and get the most we can from life.

When asked whose responsibility it is to take care of our health, we answer overwhelmingly that it is *entirely our own responsibility*[2].

Yet every day, most of us do at least one thing that we know will put our health at risk[3]: too many of us still smoke, drink more alcohol than we know is good for us, don't take as much exercise as we should, and eat too much of the "wrong" and too little of the "right" food.

Why is this? We tend to blame our lack of willpower and, certainly, this plays a role. We want to live well, but our good intentions can all too easily be overridden. But it isn't just about willpower. Overcoming ingrained habits and maintaining a healthy lifestyle is challenging, usually requiring not only personal motivation but support from those around us.

Poor health benefits no one: it reduces our life expectancy and hurts our families, it harms businesses through days lost to sickness, it costs the taxpayer through escalating healthcare costs and it places a burden on families, carers, charities and community groups. If we are to have the health outcomes we want as a society, we need everyone, be they individuals, families, communities, schools, businesses, civic institutions or voluntary organisations, to help us make this happen. In this sense, health is everyone's business.



Government cannot force people to adopt healthier lifestyles. However, it can help. It can give people information to help them make the right choices. It can help them engage with networks of other people with similar issues, and use digital channels to share information, seek advice and compare their behaviour and symptoms. It can bring together trusted partners, who can reach people in ways that Government can't, and who can themselves provide support and incentives, financial or otherwise, to make change easier and more affordable. Government can work with employers and schools to make healthier lifestyles more achievable and it can provide services and improve access to them. Finally, through insight and creativity, it can inspire us to change.

Today we are publishing the first over-arching social marketing strategy for Public Health England. This strategy outlines a radically new approach for how we propose to use social marketing through people's lives as part of a broader suite of measures to improve those behaviours that affect health outcomes.

---

[1] For example, 80% of UK adults agree that "looking after my health is important in my personal life today". *Global MONITOR 2010*, The Futures Company.
[2] 84% of those surveyed agreed that "looking after my health is entirely my responsibility". Ibid.
[3] *Healthy Foundations*, 2007.

This strategy draws on the evidence of what has worked in the past, to focus resources in those areas where Government can do most to help people finally achieve the health that they value so highly.

Anne Milton, MP

Parliamentary Under Secretary of State for Public Health

1. Executive summary

1.1 Despite people placing a high value on health and wanting to live healthy lifestyles, the majority of the adult population has at least one of the major lifestyle risks (such as smoking, regularly drinking more than the recommended limits, not being physically active and/or being overweight or obese) that can lead to poor health, increased cost to society and lives cut short[4].

1.2 Changing these behaviours is extremely challenging, often requiring not just individual motivation but sustained support from friends, family and society.

1.3 The Department of Health and the local NHS have pioneered the use of social marketing to change health behaviours, with some considerable success, particularly in areas such as smoking (Smokefree), stroke (FAST) and obesity (Change4Life).

1.4 Social marketing borrows concepts and techniques from commercial sector marketing, such as insight generation and customer segmentation, and applies them to the problems facing our society.

1.5 Without social marketing, there is a risk that people will not attempt the substantial efforts required to improve their behaviours or that attempts to change will fail in the face of ingrained habits and negative market forces.

1.6 However, changing times challenge us to be more creative, more efficient and more innovative in the way we use public resources. This is a time of great change in the way ordinary people access information. New technologies are enabling people to build new networks, create content and share ideas as never before. Public health campaigns can become part of the social currency, so that our target audiences do not just receive our messages, but identify themselves with them, so that they wish to share them with their network.

1.7 This is also a time of great learning and experimentation for the entire marketing industry, as insights from behavioural sciences, popularised by books like *Nudge*, are applied to behavioural issues.

1.8 This strategy responds to the changing political and economic climate to propose a new approach to how marketing will be used to influence health-related behaviour. It also draws on the evidence of what has worked to date, as well as setting up a programme of pilots to establish an evidence base for newer ideas, many of them emerging from behavioural sciences, to change behaviours.

[4] 71% of adults in England report at least one of the following: being overweight or obese, smoking, regularly drinking above limits, drug abuse or unsafe sex. Source: *Healthy Foundations* dataset, 2007.

1.9 This new approach will be different in that:

- It recommends far fewer social marketing programmes, prioritising those where there is evidence of efficacy.
- With the exception of the smoking (and, when appropriate, health protection campaigns, such as a flu pandemic), we propose to end central single-issue campaigns, instead taking a life course approach through which a trusted brand will deliver support on all topics that are relevant to a person at that stage.
- More will be done at a local level; the centre will do only those things which it alone is best placed to do .
- Emerging insights from the behavioural sciences will be explored to enhance existing programmes and design radically different marketing initiatives.
- Partners, community, charity, civic and commercial, will be encouraged to do more.
- While some advertising, such as the FAST stroke campaign and cancer signs and symptoms, is already resuming, we recommend a shift away from traditional mass media channels, towards those channels government already owns, such as government websites and poster sites in government buildings.
- There will also be a radical step-change in the way we use new technologies, including social media.
- Where our campaigns enter into frequent and regular communications with people, we will test ways of migrating these into digital channels.
- We will work with the Cabinet Office to pilot a payment by results approach in appropriate areas.

1.10 Social marketing will support the approach to improving public health set out in *Healthy Lives, Healthy People* and the draft indicators published for consultation in the Public Health Outcomes Framework

1.11 In order to best support these indicators, the strategy recommends that the centre fund no more than four programmes, the four being (in order of size):

- The Smokefree programme.
- Change4Life (and its sister brand, Start4Life) which will tackle all issues relating to families and middle-aged adults.
- One integrated campaign, which will take a more holistic approach to well being in later life. This activity will seek to empower older people (and, where appropriate their carers) to

seek prompt diagnosis and medical attention (for example through the cancer signs and symptoms campaign), and will challenge the expectation that loneliness, economic and physical inactivity, mental and physical deterioration and reduced quality of life are an inevitable part of the ageing process.

- A new programme, targeting young people, which will seek to influence behaviours, such as smoking, binge drinking, experimenting with drugs and risky sexual behaviours, which form part of a pattern of risk-taking in the transition from the child to adult self.

1.12 These four have been prioritised because they address those segments of the population who are greatest users of health services, because there is prior evidence that marketing can have an impact in these areas and/or because a strong case can be made that people's lifestyles are amenable to change.

1.13 Beyond this life course approach, Government retains an additional responsibility to provide authoritative national information on some topics, such as the health impacts of using illicit drugs or the harms caused by regularly drinking above the recommended guidelines, and will continue to do so.

1.14 Some of these topics, particularly NHS health protection messages including vaccination, do not fit naturally into the life course approach. Messages on these topics will be branded as NHS and will be communicated to all individuals and groups to whom they have relevance, regardless of the stage in the life course they may have reached.

1.15 Much of this information will be provided via help lines and websites, particularly NHS Choices. While we will continue to provide information, we will review what needs to be provided, consider what can best be done through other sources (such as charities) and look at ways to do this more efficiently.

1.16 As local areas take on responsibility for managing demand for local services, they will be encouraged to join up their activity with the four centrally-funded programmes, through the use of toolkits and free access to creative assets.

1.17 We will commit public money only where there is evidence that social marketing can change those behaviours that lead to improved health outcomes. In consequence, this strategy will be delivered with substantially less than the spend committed in previous years.

1.18 This strategy will have implications for how the marketing function is organised within the Department of Health, and for how this interacts with partner agencies and with the proposed Government Communication Centre (GCC), recommended in the Cabinet Office's Review of Government Direct Communication and the Role of the COI.

2. Introduction: What is social marketing?

2.1 Health-related social marketing is the systematic application of commercial marketing concepts and techniques to achieve specific behavioural goals relevant to improving health and reducing health inequalities[5].

2.2 Social marketing borrows tools and techniques, such as insight generation and customer segmentation, from commercial sector marketing and applies them to problems facing our society. Within health, it is most often used to help citizens change their lifestyles (for example by making improvements to the diets, starting a programme of physical activity, giving up smoking or reducing alcohol consumption), although it can also be used in other ways, such as changing the way citizens engage with services.

2.3 Social marketing is only one tool that Government (and others, working in partnership with Government) can deploy, and indeed it has often been used in conjunction with other policy levers, such as legislation (as in the marketing campaign that accompanied the introduction of Smokefree England).

2.4 Government funded social marketing seeks to ensure that citizens:

- are engaged with their own health and wellbeing,
- understand how their lifestyle choices impact on their current and future health outcomes (and, in the case of parents, their children's health outcomes),
- can obtain sound advice about what constitutes a healthy lifestyle, and
- have access to appropriate services, products and tools to help them change their behaviour.

2.5 The rich body of research and insight developed through the social marketing process helps to ensure that people are at the heart of policy, communications and delivery.

[5] French, Blair-Stevens, McVey and Merritt , *Social Marketing and Public Health*, 2010

An activity is classed as social marketing when it:

- Is based on real understanding of the target audience: who they are, what they think and believe and what they need.
- Uses insight to develop propositions that offer a real benefit for the audience, not just for the Government.
- Aims to achieve changes to resistant or persistent behaviours, not just to provide information.
- Applies vertically through the process: from understanding the problem and designing the solutions, to delivering and communicating products and concepts.
- Applies horizontally across types of intervention, and is not limited to narrow definitions of communications or marketing.
- Is embraced by all functions, roles and departments, focused on the behavioural goals of the target audience, not the internal structure or divisions of the providers.

Source: DH/NHS Social Marketing Review (*Oxford Strategic Marketing*, 2010)

3. Why there is a need for social marketing?

3.1 Public Health England's mission is to protect people from serious health threats, improving the health of the poorest, fastest.

3.2 The nature of public health has changed dramatically. In the mid 19th century, four out over every five deaths occurred before the age of 65. Today, more than four in five deaths are after 65.

3.3 The nature of health threats has also changed: infectious disease now accounts for only 2% of deaths. Most people now die in old age of non-communicable diseases such as circulatory (accounting for 34% of deaths), cancers (27%), and respiratory diseases (14%). Lifestyle changes, particularly reducing smoking rates and improving diets and physical activity levels, could prevent a substantial proportion of these diseases[6].

3.4 In consequence, the objectives for those engaged in public health have expanded: public health's origins were in ensuring clean water and fresh air in our towns and cities; its role is now expanding to include influencing the everyday habits of millions of people.

3.5 The indicators published for consultation in the Public Health Outcomes Framework (see appendix 2) demonstrate how the remit of public health is expanding further into areas such as social connectedness, health-related quality of life and self-reported wellbeing.

3.6 People value their health and most want to lead healthy lives. For example, 96% of mothers with children aged 2-11 agree that "eating healthily is important to my family"[7] and 63% of smokers say that they want to give up smoking[8].

3.7 Yet the majority (71%) of people have at least one of the main lifestyle risk factors (such as smoking, regularly drinking more than the recommended limits and/or being overweight or obese) that can lead to poor health outcomes[9].

Report no negative health behaviours	29
Report at least one	71
Report at least two	28
Report at least three	6
Report at least four	1
Report all five	*

Source: Healthy Foundations, 2007

3.8 Looking more closely at the data:

- 21% of the adult population smokes and, while this had reduced by seven percentage points since 1998, the decline has been greater among high income groups, resulting in a widening of health inequalities;
- 61% of adults and 28% children are overweight or obese[10];
- 82% of men and 65% of women consume more than the recommended 6g of salt per day;
- fewer than 40% of adults do the recommended amount of physical activity;
- 23% of adults regularly drink more than the Chief Medical Officer's recommended guidelines;
- around 3.8% of girls under 18 become pregnant each year (the lowest levels for 30 years)[11];
- the prevalence of sexually transmitted infections continues to increase. Young people under 25 are the most at-risk, with the peak age for women being between 19 and 20 years and for men between 20 and 23 years. Of all the 15-24s diagnosed with an STI, around one in ten currently become re-infected within a year;
- the uptake rate for pre-school immunisations are slowly improving, although there is still considerable regional variation; uptake of the MMR vaccination still lags behind other childhood vaccinations at 82.9% (in 2010);

[10] *Health Survey of England*, 2009 data
[11] ONS 2009 data.

- each year, around 70-75% of over 65s take up their flu vaccination, but only around half of clinically at-risk people under 65 do so[12] ;

- it is estimated that 5,000 lives could be saved each year if England met the European average on cancer survival rates. One requisite for achieving this would be people going to see their doctor sooner with common signs and symptoms of cancer[13];

- about a third of the population admit to taking illicit drugs at some point in their lives[14].

3.9 Some poor lifestyle behaviours are found together, for example, people who drink more than the recommended guidelines are also more likely than the general population (33.0% vs. 21.5%) to smoke[15].

3.10 These multiple risk factors are likely to extend beyond the arena of health. Many people who drink more than the recommended guidelines, eat a poor diet and smoke may also experience worklessness, financial problems, crime, housing difficulties and other problems. While this highlights the magnitude of the challenge, it also provides opportunities for Government departments to work together to deliver benefits that are felt across society.

3.11 Some of the behaviours we seek to change, such as getting a flu jab or a Chlamydia test, while they require a degree of effort, are relatively easy (and infrequent).

3.12 Others, however, involve physical and/or psychological addiction. Changing these behaviours is extremely challenging, requiring considerable personal motivation as well as sustained support. Smokers, for example, often make many quit attempts before succeeding in giving up smoking for good. If we want smokers to overcome repeated failures, we need to continue to reinforce the health benefits of quitting (and direct them towards more successful methods of quitting).

3.13 Even where no physical or psychological addiction is involved, changing an ingrained or established habit can still be hard. Many people go on diets or make resolutions to improve their eating or physical activity levels in January, only to slide back into previous bad habits, sometimes before the month is out[16]. Existing incentive structures can work against people's desire to live healthier lives. For example, many ongoing changes in the way we live our lives (such as the decrease in manual and increase in sedentary occupations, or price promotions for energy-dense food) tend to perpetuate poor lifestyles[17]. To ensure sustained change, people need motivation, ongoing support, immediate feedback and frequent reminders[18].

3.14 Government cannot force people to adopt healthier lifestyles. However, it can help. It can do this by providing people with products and tools to help them change their behaviours, by bringing together partners who can support them and provide incentives, financial or otherwise, to make change easier and more affordable.

3.15 It can also help people connect to networks of others who share similar problems and are trying to change (as in the Smokefree United virtual quitters club) and it can empower and support those public-spirited individuals (such as the 47,000 Change4Life local supporters) who are working, professionally or as volunteers, within their communities to help others.

3.16 The social marketing approach helps uncover insights into why people behave as they currently do and understand barriers, whether perceived or actual, to change.

3.17 Without motivation, there is a risk that people will not make the substantial efforts required to improve these behaviours or that attempts to change will fail in the face of ingrained habits and negative market forces.

3.18 Beyond the force of habit, marketing and communication is required for other reasons, including:

- Addressing low levels of understanding about what constitutes a healthy lifestyle (such as how to shop for, prepare and provide a healthy diet).
- Improving understanding of the impact of everyday behaviours have on future health outcomes (such as the lack of understanding that regularly drinking more than the recommended guidelines can cause cancer or that being sedentary is not just a risk factor for obesity but for many other conditions such as cancer and diabetes).
- Overcoming taboos and cultural reticence about discussing some behaviours (such as sex) and health issues (such as signs and symptoms of bowel cancer) and stigma involved in others (such as dementia).
- Building resilience and negotiation skills (particularly among young people, who may be pressured by their peer group to experiment with risky behaviours) and (among parents) skills for initiating conversations with their children about these behaviours.
- Providing trusted sources of sound advice.
- Buzz monitoring, seeding ideas and influencing social networks.
- Providing tools (such as quit kits, snack swappers and units calculators) to help people change their behaviours.
- Improving understanding of the signs and symptoms of common conditions, particularly cancer and stroke.

- Supplying communications products for local authorities, NHS and other service providers to communicate with the public.
- Creating branded programmes with which industry can join up, facilitating increased private sector funding of Government behaviour change programmes.

3.19 There is also some basic information that Government has a responsibility or duty of care to provide (such as effects of illicit drug use on health).

4. The evidence that social marketing works

4.1. The Department of Health has a long tradition of using marketing and communications to influence behaviours. Its campaigns are among the most responsive in Government (as monitored by COI's Artemis[19] tool) and as a result, the department has built up substantial databases of citizens who have chosen to make positive changes to their behaviours. The two largest databases, tobacco and Change4Life, contain over 860,000 and over 525,000 citizens respectively.

4.2. The people on these databases continue to interact with the campaign brands for substantial periods of time. For example, a mailing to a cell of the Change4Life database that had completed the initial profiling questionnaire (*How Are The Kids?*) with a follow-up questionnaire one year later, achieved a 28% response rate – the highest ever recorded in Government.

4.3. Health related issues can inspire people to get involved, not only to improve their own lives, but to improve the lives of others in their communities. For example, over 47,000 public-spirited individuals have already registered to support the Change4Life social movement by helping others in their community. These people tell us that they spend an average of 19 hours per week on Change4Life related activity, which includes having conversations with people about diet, activity or weight, putting up posters, giving out leaflets or organising events in their local communities. This network includes childminders, teachers, healthcare professionals and volunteers, who are a valuable resource for encouraging social change.

4.4. However, to have value, social marketing needs to do more than generate response; it needs to change behaviours and to do so in a way that is cost effective, relative to other ways of changing behaviour.

4.5. There is evidence that social marketing changes behaviours.

4.6. The Change4Life evaluation indicates that 30% of mothers with children aged 2-11 claim to have changed at least one thing in their children's diets and activity levels as a direct result of Change4Life. If the survey results are true nationally, this equates to over a million families. Basket analysis, carried out by dunnhumby, demonstrated that a sample of 10,000 families who had engaged with Change4Life did indeed make healthier purchase decisions (across a basket of 20 representative food groups), relative to a demographically comparable control sample[20].

[19] COI's Artemis tool holds data for over 50 Government campaigns and enables Government departments to assess to cost effectiveness of their activities.
[20] *Change4Life: One Year On*, HM Government 2010.

4.7. There are encouraging signs that social marketing campaigns deliver monetised benefits. In the case of the FAST campaign for stroke, an investment of £8 million delivered healthcare savings of £25million[21].

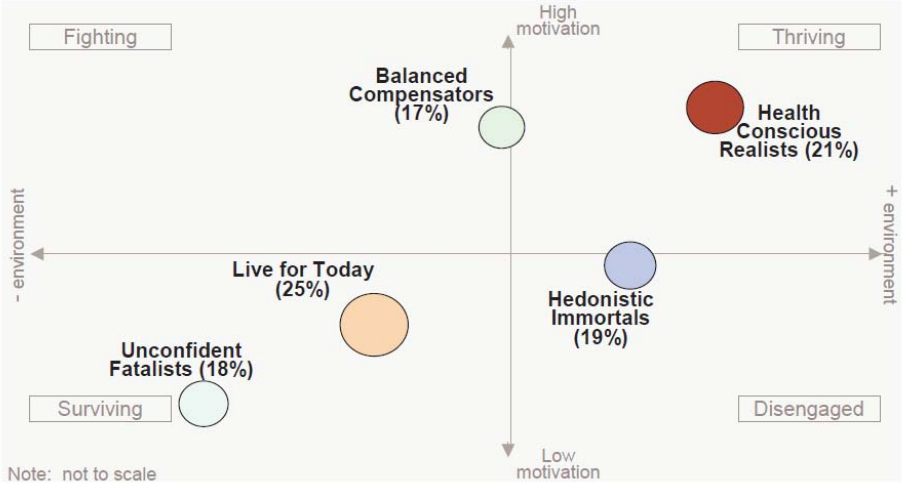
4.8. In the case of smoking cessation, the Smokefree campaign generated 200,000 extra quitters, delivering a value of £1.5 billion, against a cost of £20million[22].

4.9. While it would be wrong to extrapolate from these campaigns to all social marketing, there is enough evidence that well thought-out interventions can deliver good value for money.

4.10. More detail is included in the Impact Assessment, published with this document.

[21] Source FUEL.
[22] For more detail on these campaigns, see the Impact Assessment published with this document.

5. Target audiences



5.1. The majority of health problems fall disproportionately on individuals, families and communities that have lower incomes and lower education levels; some (such as low levels of physical activity) also disproportionately affect particular ethnic groups.

5.2. Wealthier, educated people with managerial jobs are more likely to have access to health information (for example via the newspapers they read or via employee wellness programmes), to seek out additional information (for example via websites) and to feel confidence in their own ability to use and act upon that information.

5.3. While access to new technologies has been growing rapidly, there are still nine million people in the UK who have never accessed the internet. These people are more likely to be older, to have fewer qualifications and lower incomes than those who do use the internet[23]. In addition, there are 4.8 million people living in Great Britain who report that they never read or even glance through a newspaper. Moreover, 4.4 million report that they never watch any television news or current affairs programming. 785,000 people could be termed "information poor" in that they fall into both groups[24].

5.4. In 2007, the Department of Health conducted a major piece of quantitative research and analysis, called the Healthy Foundations segmentation. This explored the relationship between health outcomes, environment and personal motivation[25]. The exercise generated five distinct cluster groups.

Healthy Foundations Cluster Map

[23] 45% of people with no formal qualifications have used the internet vs. 97% of people with degrees. Source: National Statistics August 2010.
[24] GB TGI, 2009-10.
[25] For more detail, see *Ambitions for health: a strategic framework for maximising the potential of social marketing and health-related behaviour*, HM Government, 2008

5.5. Two of these groups, “Unconfident Fatalists” and “Live For Todays” report both low personal motivation and an environment that is unsupportive of healthy lifestyles.

5.6. The most challenged group, Unconfident Fatalists, tend to live in the most deprived areas and are the least likely to be in paid employment. They have higher than average smoking prevalence, higher incidence of obesity and overweight, are the least likely to take exercise, less likely to eat five portions of fruit and vegetables and most likely to have a high GHQ score (i.e. to report poor mental health)[26]. These are the people who would most benefit from lifestyle change. However change will almost certainly require more help and support than information alone can provide.

5.7. For all people, different lifestyle issues (or combinations of lifestyle issues) occur through the life course, resulting in different needs:

Pre-natal and Pre-school:	support relating to the early years, including immunisation, maternal health in pregnancy, smoking in pregnancy, smokefree environments, alcohol and drug use in pregnancy, education in PHSE, breastfeeding, weaning and active play.
School years:	parents need support on family diet and physical activity, mental wellbeing (tips for raising a happy child), education in PHSE, smokefree environments, strategies for parents to help their children delay initiation into risky behaviours (smoking, sex, alcohol etc.).
Young people:	a trusted source of information on subjects like drugs as well as support and resources to help young people negotiate the transition from their child to their adult selves, including resilience and negotiation skills around smoking, alcohol, drugs and sex.
Mid life:	smoking cessation, responsible drinking, weight loss, diet, physical activity, tackling any poor sexual health issues, health and wellbeing at work, at-risk immunisation, planning for future needs.
Retirement:	falls prevention, winter preparedness, increasing vigilance for the signs and symptoms of conditions like cancer and dementia, advice for living with conditions (including the impact of alcohol consumption upon those conditions), smokefree homes (for at-risk patients), smoking cessation, maintaining mental wellbeing, making best use of service, planning for future needs, such as end of life care.

5.8. Beyond individuals and families, social marketing also works to change the behaviours of other audiences, such as opinion leaders, the media and front line staff.

[26] For more detail, see *Ambitions for health: a strategic framework for maximising the potential of social marketing and health-related behaviour*, HM Government, 2008

6. What are the big insights we have into our target audiences?

6.1. Changing health-related lifestyle behaviours is seldom easy. In 2010, Oxford Strategic Marketing identified ten universal insights, which can be leveraged to increase success levels[27]. These were:

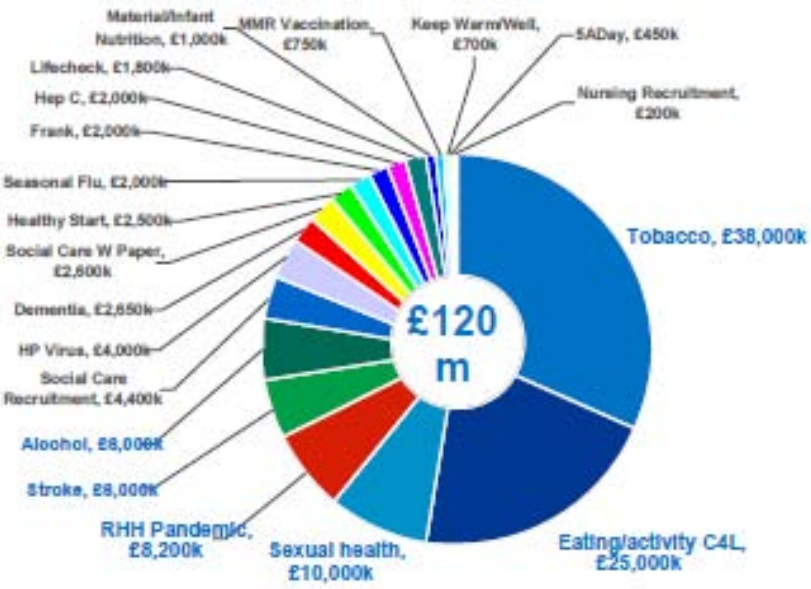
Insight	Potential Leverage
People can feel powerless to change. However, if people can succeed in one area, they gain a sense of empowerment that can be used to inspire further changes.	Merge databases and pursue cross-selling strategy (e.g. contact successful quitters with offers about other lifestyle changes)
There is a universal belief that "it will never happen to me", especially among younger people.	Consider use of role models as credible witnesses
People live for today, preferring immediate benefits and discounting future negative health consequences.	Develop immediate and tangible rewards and incentives
There are a small number of teachable moments, when major lifestyle events (such as the birth of a first child; or diagnosis of a long-term condition) when people are more open to change and actively seek new information.	Use the communications channels of partners and intermediaries to reach people during these moments
People seek to conform to perceived social norms and will adjust their behaviour to fit in with what they believe other people are doing.	Trial communications solutions that challenge incorrect assumptions about social norms (for example that most people regularly drink more than the recommended guidelines)
People are more likely to start to modify a behaviour if they can make a series of small changes, rather than change completely.	Find ways to break behaviour changes into manageable "chunks" with mechanisms for transitioning people
People are prepared to make changes for others that they would not make for their own health.	Use the power of children as a motivator (and as change-agents within families)
In general, people respond to more positive, optimistic messages.	Place people at the centre of their own change, rather than lecturing; continue more positive tone established by Change4Life
People will not act if they are unsure of the outcome, or if they believe the treatment is worse than the condition.	Use partners, particularly the charities, to spread good news messages (such as improved cancer survival rates) so that people can see a benefit to them in taking the first step towards action
People delay seeking help, even when they notice change, whether because they do not recognise common symptoms of illness or do not feel entitled to access services.	Challenge the assumption that physical and mental deterioration is a natural part of the aging process, or should be accepted as the cost of previous poor behaviours

[27] For more detail see *Health Improvement Social Marketing Strategy 2010-13*, Oxford Strategic Marketing, 2010.

7. Why there is a need for a new strategy?

7.1. In its review of social marketing in the Department of Health and the NHS, Oxford Strategic Marketing identified seven flaws in the way marketing resources were being deployed across the system. These were:

- Over-prioritisation of primary prevention (smoking, drinking at harmful levels etc.) to the near exclusion of secondary prevention (such as early detection).
- Very long timescales for payback (whereas secondary prevention might pay back sooner).
- Duplication of resource, for example via the reinvention of insights, duplication of creative assets.
- Too much top down direction and too little local creation, resulting in a lack of local knowledge and local marketers either “cherry-picking” from national initiatives or generating their own ides.
- With the exception of Change4Life, a focus on single-issue campaigns, missing the opportunity to “ladder” people up from successfully tackling one behaviour, to changing others.
- A lack of coordination across Government.
- Failure to employ all marketing levers, particularly intermediary marketing.



This strategy responds to each of these seven points.

7.2. In addition, the role of the centre is changing. By 2013, responsibility for public health (and with it public health social marketing) will be transferred into local authorities. The centre will not mandate how local authorities set about improving health outcomes and so it will be for local areas to decide whether they prioritise resources for social marketing campaigns in future. While we anticipate that local areas will eventually take a leadership role in the development, implementation and funding of social marketing, it is likely that local spending on social marketing will dip during the transition period. It will be crucial to work with local areas, whether NHS or local authorities, to enable them to join up what activity they can fund with national programmes in the least resource-intensive ways possible.

7.3. Finally, the Department of Health supported over twenty social marketing campaigns in 2009. Some of these were below a threshold of spend at which they could reasonably be expected to have any significant impact on behaviours. Going forwards, we will focus on fewer

programmes, particularly those that have the scale to capture the public's imagination, are attractive to partners and can fund thorough evaluation.

Focus on Single Issue Campaigns

7.4. The example below illustrates the many different identities currently in use for the NHS Health Trainers programme.

Proliferation of brands at a local level: NHS Health Trainers

7.5. While allowing each local area to each develop its own identity for Health Trainers was intended to reflect the “homegrown” nature of the programme and avoid a “one-size-fits-all” solution, in practice the locally-generated treatments are remarkably similar. On reflection, it would have been more time and cost-effective either for the centre to have produced an identity or for one local area to have developed an identity which was then available to others.

7.6. This strategy sets some parameters for what should be done centrally, and what is best done locally, to avoid future duplication and waste of resources (see section 8).

7.7. The Coalition Government has a clear intent to have fewer, more effective communications and a greater devolution of responsibility to partners, both civic and commercial, and is seeking to put more responsibility into the hands of local people. Good social marketing has always been centred on the needs of the target audience, but there is now an opportunity to involve local people and local areas more in the creation and implementation of social marketing programmes, for example via the establishment of local community “bid funds”.

7.8. There have been interesting new developments in the behavioural sciences, which are having a profound impact in the wider marketing community. Popularised by books such as *Nudge*, these ideas challenge us to think differently about how we influence behaviours. In the past, we have generally tried to change attitudes as a precursor or accompaniment to changing behaviours. While this feels intuitively right, it is troubling that, in health, people’s behaviours so often conflict with their stated attitudes. By changing the choice architecture, for example by changing default options or changing perceptions of social norms, it may be possible to change what people do without necessarily changing their attitudes.

7.9. Finally, the Cabinet Office has recently conducted a review of Government marketing and the role of the COI. The implications of this review for the way in which the Department of Health commissions marketing campaigns are covered in section 13.

8. Key principles for the new strategy

8.1. This strategy will result in substantial changes to social marketing, not only to the activity the public may see in future, but also to the way in which we organise ourselves, make decisions, obtain funding and assign budgets.

Summary of how this strategy will be different

There will be far fewer social marketing programmes, prioritising those that are proven to work.

With the exception of smoking, there will be no central single-issue campaigns. Instead social marketing will take a life course approach, through which a trusted brand will deliver support on all topics that are relevant to a person at that stage.

More will be done at a local level; the centre will do only those things which it alone is best placed to do.

Emerging insights from the behavioural sciences will be deployed to enhance existing programmes and design radically different marketing initiatives.

Partners, including commercial sector partners, will be asked to do more.

While some advertising is resuming, we will continue the shift away from traditional mass media channels, towards lower-cost channels and those (such as Government web sites or posters in hospitals and General Practice) that we own.

We will increase our use of social media, to enable people to build and join networks of others who face similar problems and to access, create and share information and ideas through those networks.

Where our campaigns enter into frequent and regular conversations with people, we will test ways of migrating these communications into lower-cost digital channels.

We will work with the Cabinet Office to pilot a payment by results approach in appropriate areas.

8.2 What Government will fund

8.2.1 Our approach to marketing is changing. In the past, we started with the question "how can the Government achieve this?"; in future we will recognise that others, often working in partnership with us, may be better placed to achieve our aims. The Department of Health, working with other government departments, will concentrate on those things which it is best placed to do, such as: the management of the national media owners; brokering relationships with national partners; developing common evaluation frameworks; managing campaigns that cross borders, (such as emerging and social media) and those where economies of scale or the use of common methodologies benefits all, such as negotiating contracts with call centres or the development and stewardship of a small number of brands which can then be used for free by local authorities and GP consortia.

Best done nationally, once	**Best done locally and tailored to local needs**
Strategic planning and insight generation	
Kick-starting an issue	Local needs assessment
Engaging national high impact media and partners	Driving individuals to local services, managing supply and demand
Buzz monitoring and social media	Identifying local key audiences and "hot spots"
Driving economies of scale	Engaging local community leaders
Acting as a planning and best practice hub	Engaging local healthcare professionals
Maintaining and strengthening core branded programmes	Collecting local data and sharing results

8.2.2 The centre will also take responsibility for ensuring that new developments in the public health evidence base and the implications of these, (for example changes to the Chief Medical Officer's guidance), are fed through to healthcare professionals, partners and local areas.

8.2.3 Communications and marketing will not be an assumed element of all policy initiatives. We will commit public money only where there is a measurable benefit to public health, with an emphasis on those programmes that have been professionally evaluated. Those programmes that are below a threshold where they can gain any serious momentum will be culled. In consequence, the central budget required for marketing activity will be approximately 40% of that spent in previous years.

8.2.4 Even allowing for efficiency savings, the reduced budget has necessitated prioritisation. We cannot afford to maintain all of the activity that we had in the past. We have focused our resources on campaigns that:

- Address the draft indicators outlined in the Public Health Outcomes Framework.

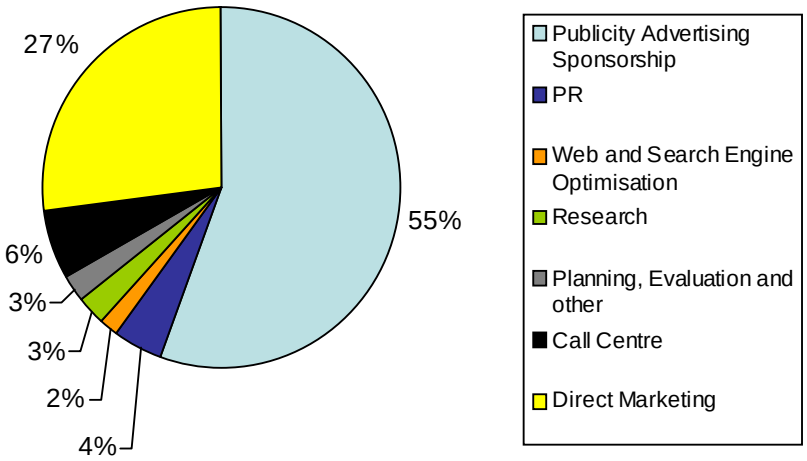
- Speak to people at those time in the life course (such as the formation of families) when they are the highest users of health services.
- Talk to people during key “teachable moments”, such as starting a family or entering retirement, identified as most likely to lead to change.
- Tackle issues that are priorities across society, rather than for the health system alone.
- Where there is a duty of care or moral responsibility to provide information.
- Where the public expects and relies upon government information (as in the case of the recent pandemic flu outbreak).

8.2.5 We will move from predominantly single-issue campaigns, to an enhanced version of the model pioneered by Change4Life, whereby a single trusted brand delivers marketing and communications on multiple topics. This will deliver cost efficiencies, for example through shared agency fees, websites and call centres. However, the primary reason is audience-focused. Too often in the past we have held separate conversations with the same people, one day talking to them about their diet, the next about their alcohol consumption, without recognising that poor diet and drinking at higher risk levels are linked behaviours in an unhealthy lifestyle, reflecting deeper and shared problems. As announced in *Healthy Lives, Healthy People*, we will sequence our social marketing programmes through the life course, so that at every stage in an individual’s life, there is a trusted source or brand, providing all the information, support and resources, he or she might need.

8.2.6 We will work with the proposed new Government Communications Centre (GCC) and with the proposed Government Communication Oversight Panel to ensure that health communications are included within the new themes for government communications, and aligned with Government strategy and priorities).

8.2.7 The exception to this life course approach will be tobacco. Smoking remains by far the single greatest cause of early death and preventable illness in England, by itself accounting for half of the difference in healthy life expectancy between the richest and the poorest people in society. Given the strong track record of the current approach, we will continue to support people’s attempts to give up smoking through the Smokefree programme.

8.2.8 The implications of this approach is that there are some programmes and campaigns that DH will no longer fund centrally, for example:



- Communications to support the Healthy Start Programme.
- Separate communications for the 5 A Day programme.
- A HPV vaccination campaign.
- A Hepatitis C campaign.

- Communications to drive traffic to NHS LifeCheck tools.

8.3 Changes to how funds are deployed

8.3.1 During 2009, 55% of central marketing funds were spent on paid-for forms of publicity, such as advertising and sponsorship, much of this television advertising.

Use of marketing resources, 2009

8.3.2 Following the coalition government's freeze on non-essential marketing expenditure, all social marketing programmes were reduced and expenditure on advertising all but ceased.

8.3.3 We have now had the opportunity to learn from the freeze and to assess where the loss of mass communications had a negative impact. For example:

- the number of people joining Change4Life fell by 80%. Calls to the Change4Life information line fell by 90% and web visits by two thirds;
- calls to the FRANK help line fell by 22% and web visits by 17%;
- visits to the Smokefree website fell by 50% The volume of people making a quit attempts also fell, in line with the reduction in purchased media spend.

8.3.4 Evidence submitted to the All Party Parliamentary Group on Smoking and Health concluded that the cessation of marketing activity has resulted in declining quit attempts and subsequent loss of life from smoking-related illness.

"There is good reason to believe that smokers still require information on the urgency of stopping and best ways of achieving this and it is clear that awareness-raising remains an important way of influencing behaviour. Evidence shows that in recent years total spending on government mass media campaigns in a given quarter is associated with smoking cessation activity in that quarter. If, as seems likely, this association is causal, the recent suspension of mass media campaigns will lead to significant loss of life and with every month that passes without further activity the death toll will grow."

(Professor Robert West, 2010)

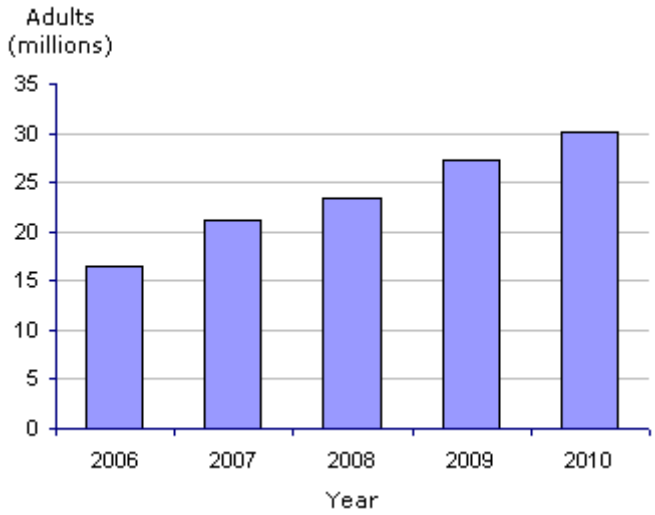
8.3.5 We now recommend that some advertising, and other forms of mass communication such as sponsorship, paid media partnerships and PR, be resumed. However, this will be at lower levels and as part of a broader marketing mix.

8.3.6 Government is changing its relationship with the agencies, media owners and brands. As part of this, we are redefining our relationship with media owners from a model where we purchase their space or air time, to one where there is greater reciprocity. In the new model, government-generated content should have real value to the media owner. A pioneering example of this would be the Change4Life "Great Swapathon", which leveraged value from News of the World, Asda and major manufacturers. This model embraces a mixed economy approach where we can reciprocally share customer information with media partners to common better effect.

8.3.7 In addition, the recent Cabinet Office Review of Government Direct Communications and the COI announced that Government will invite agencies, media owners, and voluntary and community organisations to join with it in forming a Common Good Communication Council (CGCC), which will invite bids from providers to work for free or near free on campaigns for the common good. We will watch the development of the CGCC with interest and will explore the potential for some of our messaging to be developed and carried through this scheme.

8.3.8 Many of the behaviours we seek to change require continued support and reinforcement. In the past, much of this reinforcement was provided through information and other resources, mailed frequently to the target audience. Many of our most successful case studies involve this form of engagement. However, it is expensive and it is often (although not always) uni-directional, with limited opportunities for people to enter into a dialogue, either with us or with other people who are also trying to change.

8.3.9 In recent years, penetration and use of mobile phones, digital media and social networking sites has increased rapidly among our core target audiences. The Race Online 2012 initiative aims to accelerate this trend and further reduce digital inequality.



8.3.10 New technologies enable us to reach our target audiences in new ways, to amplify our current messages and to target small and discrete groups of people

8.3.11 Unlike traditional media, digital is not a monologue: it enables instant and ongoing dialogues. This enables the user to engage in communications on three distinct levels of dialogue, each of which is relevant for Public Health England:

- Private: securely encrypted communications are passed between parties, allowing transmission of information that is sensitive.
- Personal: customised communications are sent to individuals.
- Public (social media): communications are shared in an unrestricted manner, with the express intention that others may read and share the content.

8.3.12 Social media channels also enable us to rapidly disseminate messages to our networks of supporters (for example via our Twitter feeds).

Adults using the internet every day (Source ONS)

8.3.13 At its best, technology can empower citizens to make better decisions about their wellbeing for themselves (and their dependents), based on their own individual circumstances.

8.3.14 Technology also facilitates individual tailoring of information and presentation of choice based on personal circumstances.

8.3.15 Access to new technologies has grown so fast (as has the functionality provided by those technologies) that it is impossible to predict how people will be using them through the life of this strategy. However, at minimum, we would expect to see:

- increased use of social networking sites to connect with others, converse and share information (for example, in only a few months, the Change4Life Facebook page has grown to over 45,000 “fans”, who, with minimal interference or moderation from the centre, discuss and swap ideas for healthier lifestyles);

- people expecting to be able to find information and tools where they choose to be, rather than at the brand owner's site (which will require us to create "white-labelled" tools that can be carried on or linked to from partner websites (as we began to do with the Change4Life Great Swapathon on line tool);

- greater use of on line and other technology platforms to access services (in only two years we have seen the proportion of people ordering a smoking cessation Quit Kit "flip" from primarily telephone ordering to primarily online ordering);

- the delivery of products and services through new technologies (a recent example of this is the Drinks App available on NHS Choices. Since its launch in December 2010, 197,000 people have downloaded the drinks tracker app to their iPhones[28]. This is impressive since, in the burgeoning market, only a small percentage of apps become popular. As we go forwards, we will use end-users in the design of our apps (user-centred design) and will build "social functionality" (such as the ability for users to rate and review our apps), since the best rated apps generally become the most popular;

- people joining together to use their power to access discounts (for example via Groupon), which will have implications for how we deliver partner-funded offers (it was a failing of the recent Change4Life Great Swapathon that people were not able to access partner offers online).

8.3.16 Developing our use of social media will be especially important for the youth programme and for families (recent ethnographic research[29] with low income families found that children were significant drivers of new technology within households and researchers witnessed children as young as three using their own laptop computers).

8.3.17 We should remember, however, that this increase has been driven not by websites offering information, but by those offering music, video, shopping, gaming, gambling and gossip, all of which offer a more interesting and stimulating user experience than most current Government campaigns.

[29] 2CV 2010.
[30] Source: COI. Definition of low income: adults under 44, with children in home and household income less than £24,999, socio-economic groups C2DE.

8.3.18 People can interact with us, access our services, share our messaging and our products throughout their networks, but the choice of whether to do so is theirs. If we want them to interact with us, we need to provide content that is rewarding and has value in their eyes. A good example of this was Change4Life's Let's Dance activity, which asked families to upload video of their children dancing with the prize of chance to train with Diversity. This attracted over 150,000 YouTube channel views and over 468,000 uploads viewed.

8.3.19 Many in our target audiences are kinaesthetic learners, that is they prefer to learn by doing, rather than by reading or listening. The interactivity that digital platforms afford provides opportunities to use digital platforms to influence behaviours, provided we make those platforms "sticky" enough.

8.3.20 Going forwards, we propose that Government form a network of talented designers, content creators and app developers to work with our target audiences to co-develop new tools based on the needs of the user.

8.3.21 These could include:

- Individual tools (to support individual responsibility), for example health checkers and monitors and data visualisation tools. For example, Change4Life's Walkometer app (used over 10,000 times) allowed users to input their daily exercise and see their output over time in terms of calories burned, steps taken or a distance walked. These tools can quantify change and reward people for that change.
- Group tools (recognising people's need for support) , enabling people to benchmark themselves against others, set goals and make performance against those goals visible to others.
- Aggregating tools, which sort through data to enable people to, for example, find their local park.
- Tools which provide access to expertise or appointment reminders.
- Games, which build health content into gameplay.

8.3.22 We should also explore the huge potential of social media as a mechanism for listening (for example via buzz monitoring) rather than for sending messages out to our audiences. Our Facebook pages are already providing a mechanism for garnering instant feedback on our brands and our activities.

8.3.23 Digital media have a propensity to propel issues into the mainstream that exceed their first-hand reach (as when the mainstream news picks up stories based on what high-profile individuals have tweeted.).

8.3.24 However, not all our audiences are yet using new technologies in this way. For other audiences, we will need to maintain more traditional channels for the time being. We will

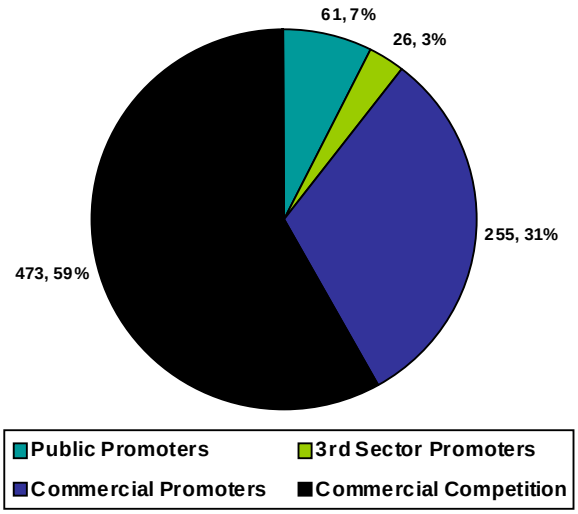
therefore test and evaluate a strategy of migration, gradually reducing paper-based materials, sent via the mail, with digital fulfilment.

8.3.25 Using digital technologies will also enable us to create more and better tools that provide opportunities for interaction, co-creation, sharing within a social network and can provide rapid feedback on people's progress. These include apps to allow people to track their alcohol units or calorie expenditure, to calculate how much money they have saved since they quit smoking and share their experiences of quitting with their friends via Facebook.

8.4 Role of civic partners

8.4.1 From April 2013, responsibility for public health marketing will move to local authorities, as they take on overall responsibility for public health. While the centre cannot mandate that local areas prioritise funds for social marketing, our ambition will be that most activity will eventually be developed and implemented at a local level.

8.4.2 Within their new remit, local authorities and GP consortia will take responsibility for managing demand for local services, such as Chlamydia screening or local stop smoking services. While the centre will no longer be running this activity, we will give free access to proven national creative assets (such as Sex: Worth Talking About and FRANK) and will provide toolkits to allow local areas and consortia to adapt these materials as their needs change.



8.5 Role of commercial partners and NGOs

8.5.1 The success of this strategy will depend not only on how efficiently we deploy public funds, but also on how successful we are at attracting others, including the voluntary sector and industry, to support our programmes.

8.5.2 In the past, our approach was "How can Government achieve this?" In future, we will start from a presumption that others may be better placed to achieve our goals, often working in partnership with us.

8.5.3 Industry in particular has far greater marketing resources than the public sector. In 2009, our highest spending year for marketing and communication, only 7% of the marketing and communication on health topics was public sector funded; the commercial sector accounted for 90% and the charities 3%.

Total Media Spend on Health Topics, England 2009 (£m, % share)

8.5.4 Historically, commercial sector resources were often used to promote behaviours (such as the consumption of foods high in fat, sugar and salt) that lead to poor health outcomes.

8.5.5 However, some sectors, such as the fitness industry, providers of weight loss services or manufacturers of nicotine replacement therapy, have commercial interests that naturally promote healthy behaviours.

8.5.6 Within the food and alcohol industries, some companies, recognising that their customers look to them for help in maintaining healthier lifestyles, have already begun to promote healthier alternatives and responsible consumption.

8.5.7 In response, government has started to work more closely with these companies, aligning their activity with publicly-funded campaigns through co-branded partnership marketing opportunities.

8.5.8 The contribution of partners to government marketing programmes has grown considerably. On Change4Life alone, commercial sector contributions grew from £9 million in 2009/10 to £12 million in 2010/11[31].

8.5.9 While it has been most conspicuous under Change4Life, partner support has also been evident in areas such as tobacco control, where the pharmaceutical industry, both manufacturers and retail, have recently become involved in the Quit Kit.

8.5.10 Partnership marketing is valuable not only for its financial contribution. Commercial brands often have trusting relationships with our key target audiences and can reach them in ways that we cannot, and that are closer to the behaviours we want to influence, for example via targeted offers as part of their loyalty programmes, through in-store signage or by putting nutritional information on restaurant menus. As part of the Public Health Responsibility Deal,

commercial companies have recently made individual pledges, for example: to roll out Change4Life branding into 1,000 stores (the Association of Convenience Stores), to provide an additional £1 million to tackle alcohol misuse by young people (Asda), and to aim to remove 100 million units of alcohol from the UK market each year through lowering the strength of a major brand by 2013 (Heineken).

8.5.11 The majority of partner marketing takes the form of in kind contributions, for example:

- PepsiCo's advertising campaign in support of Play4Life
- Nintendo Wii Fit's co-branded activity in support of Change4Life
- In store price promotions from Tesco, offering money off fruit and vegetables
- ITV's support for Walk4Life, working with Walk England, British Heart Foundation and the Ramblers
- The Great Swapathon, a collaboration between Asda, News of the World and seventeen other manufacturers and physical activity providers

Partners also provide access to their customer insight, including access to market intelligence (such as sales data) for the purposes of evaluation.

8.5.12 However, we now need a step change in both the quantity and the nature of partnership marketing. We are beginning to explore other ways for partners to contribute to our programmes, for example via sponsorship of elements of key programmes, such as specific pieces of sub-branded activity within Change4Life.

8.6 Pioneering a different approach

8.6.1 In recent years, the fields of social psychology and behavioural economics have produced rich insights into why we behave as we do. These insights challenge us to think differently about how we engage with people in seeking to change their behaviours. In the past, we have most often attempted to change attitudes as a precursor (or sometimes as a companion) to changing behaviours. There are a number of examples where such techniques have been cost-effective and have built self-efficacy (for example, in the self-management of long-term conditions[32]). Yet we recognise that, in many cases, actual health-related behaviours do not align with stated attitudes or intentions. There is a growing body of evidence to suggest that it is possible to change behaviour by changing the context or environment within which we make decisions and respond to cues, helping people make better choices for themselves.

8.6.2 In 2010, the Institute for Government and the Cabinet Office produced their MINDSPACE report, which provided a toolkit for using behavioural insights in policy.

[32] See www.expertpatients.co.uk.

8.6.3 This document identified nine key influences on behaviour, captured as the mnemonic "MINDSPACE". This can be used as a simple checklist for policy development:

Messenger	We are heavily influenced by who communicates information
Incentives	Our responses to incentives are shaped by predictable mental shortcuts such as strongly avoiding losses
Norms	We are strongly influenced by what others do
Defaults	We 'go with the flow' of pre-set options
Salience	Our attention is drawn to what is novel and seems relevant to us
Priming	Our acts are often influenced by sub-conscious cues
Affect	Our emotional associations can powerfully shape our actions
Commitment	We seek to be consistent with our public promises, and reciprocate acts
Ego	We act in ways that make us feel better about ourselves

8.6.4 A number of these insights have already been leveraged through Department of Health programmes, for example:

- **Defaults**: introduction of the national bowel cancer screening programme, such that people have to opt out of the test. This has increased the number of tumours being detected by 12%.
- **Salience**: providing relevant information at a key life stage, for example targeted smoking messages during pregnancy, and
- **Commitments**: the use of quit dates to form a public promise to give up smoking.

8.6.5 Others are currently being piloted, for example Change4Life social norming pilot, which seeks to establish whether messaging that references social norms (e.g. "Six out of ten people in Wigan eat their five a day") is more effective in changing people's behaviours than more traditional messages.

8.6.6 While we do not believe that any one of these insights is a "magic bullet", this strategy will make far greater use of the tools and techniques in MINDSPACE, for example by:

- introducing "energy contracts" as part of the Change4Life collaboration with Lazytown (using Commitment);
- assessing the effect of 'prompted choice' on organ donation registration, in partnership with the DVLA. Evidence suggests that this could significantly increase the number of life-saving donors on the register.

9. Meeting our corporate objectives

9.1. All our social marketing programmes exist to deliver against the wider objectives of the Department of Health and Public Health England

9.2. The Public Health Outcomes Framework set out over sixty draft indicators supporting the Government's vision for public health, and the domains of: health protection and resilience; tackling the wider determinants of health; health improvement; prevention of ill health and healthy life expectancy; and preventable mortality.

9.3. There are many, often clinically-driven, indicators, such as emergency readmission rates to hospital or treatment completion rates for TB, over which social marketing will have no influence.

9.4. For others, such acute admissions as a result of falls, social marketing can have a role to play but only as a small part of a broader policy

9.5. There are a relatively small number, where we believe social marketing can have a strong influence on the indicator, either in tandem with other policy initiatives, or in isolation.

9.6. These indicators are set out in the table overleaf

9.7. In order to make best use of our resources in support of these indicators, we recommend four programmes:

- The Smokefree programme.
- Change4Life (and its sister brand, Start4Life) which will tackle all issues relating to families and middle-aged adults.
- One integrated campaign, which will take a more holistic approach to well being in later life. This activity will seek to empower older people (and, where appropriate their carers) to seek prompt diagnosis and medical attention (for example, if they experience the signs and symptoms of cancer), and will challenge the expectation that loneliness, economic and physical inactivity, mental and physical deterioration and reduced quality of life are an inevitable part of the ageing process.
- A new programme, targeting young people, which will seek to influence behaviours, such as smoking, binge drinking, experimenting with drugs and risky sexual behaviours, which form part of a pattern of risk-taking in the transition from the child to adult self.

	Early Years	Family	Young People	Mid life	Older People	Other discrete audiences	Total population
Moderate-high potential for marketing to influence	Breastfeeding initiation and continuation rates	Prevalence of healthy weight in 4-5 and 10-11 year olds	Under 18 conception rate	Prevalence of healthy weight in adults			Population vaccination coverage
	Maternal smoking prevalence	Smoking prevalence over age 18					Access and utilisation of green space
	Rate of dental caries in children aged 5		Chlamydia diagnosis rates	Rate of hospital admission for alcohol related harm	Patients with cancer diagnosed at stages 1 or 2 as a proportion of all cancers		Cycling participation
		Percentage of adults meeting the recommended guidelines on physical activity		Percentage of adults meeting the recommended guidelines on physical activity	Percentage of adults meeting the recommended guidelines on physical activity		
Marketing has marginal influence, as part of a broader policy				Prevalence of recorded diabetes	Fuel poverty	Proportion of people presenting with HIV at a later stage of infection	Screening uptake
					Older people's perception of community safety		Differences in life expectancy between communities
					Health related quality of life for older people		Casualties on England's roads
					Acute admission as a result of falls in older people		Self-reported wellbeing
				Take up of NHS Health Check programme	Take up of NHS Health Check programme		Social connectedness
				Mortality rate for all CVD (including stroke) in persons aged under 75			
				Mortality rate for all liver disease in persons aged under 75			
				Mortality rate from cancers in all persons under 75			
				Mortality rate for COPD in all persons under 75			
					Excess seasonal mortality		Excess seasonal mortality

9.8. The next sections of this document set out how those four programmes will develop in line with this strategy.

9.9. Separate documents, giving more detail on each programme, will be published in due course.

10. Applying the strategy: Tobacco control

Summary

Smoking is still the number one cause of premature death and preventable disease in England.

There is a strong international evidence base for the impact of marketing on reducing smoking prevalence.

However, recent evidence suggests that motivation to quit and quit attempts are both in decline. We believe this is at least partly due to the stress and uncertainty created by the current economic climate (which causes people to rely more on everyday "props" and to put off making any significant commitment to change – such as a quit attempt – until a time of greater stability).

The role of the centrally-funded national marketing campaign will therefore be to remind smokers why they need and want to quit, triggering quit attempts at a population level and signposting people to information to help them make more effective quit attempts.

We will also work with a range of national and local partners and with health professionals to ensure they are aware of the important role they can play in prompting quit attempts.

The central programme will expand to include new themes of secondhand smoke and reducing uptake of smoking in young people. We will continue work to address smoking in pregnancy.

Local areas will increasingly take responsibility for driving traffic to services as well as marketing to specific local audiences (e.g. ethnic minority groups), and for issues that or of particular local concern, (such as illicit tobacco).

Background

10.1. Smoking is still the number one cause of premature death and preventable disease in England. Around half of all regular smokers are eventually killed by a smoking-related illness.

10.2. While smoking rates have declined over past decades, 21% of adults still smoke. Smoking remains a major factor in health inequalities, accounting for approximately half of the difference in life expectancy between the lowest and highest income groups.

10.3. Stopping smoking helps prevent smoking-related illnesses and helps people live longer, whatever their age when they quit. However, tobacco is highly addictive and for many people, quitting successfully is extremely difficult.

10.4. There is a strong international evidence base for the impact of marketing on reducing smoking prevalence. Marketing activity over the last few years has centred on three key objectives: reinforcing smokers' motivation to quit, triggering action and making quitting more successful by signposting people to the support available. We have focused our activities on smokers who work in routine and manual jobs, because of the high prevalence of smoking in these groups (28%) double that of professional and managerial groups.

10.5. Insight research with routine and manual smokers identified that family and community are very important to them, so motivation campaigns focused on stopping smoking for the sake of family and loved ones – positioning smoking as 'the enemy of the family'. This approach aimed to counter the tendency to discount future benefits associated with traditional health harm messaging (or hyperbolic discounting), by focusing on an inarguable here-and-now motivation rather than a theoretical, future threat to health. Tracking research shows marketing activity persuaded significant numbers of smokers that they should give up smoking now, with a high of 54% smokers agreeing this, following hard-hitting activity in Autumn 2009[33].

10.6. Smokers are up to four times more likely to be successful if they quit with local Stop Smoking Services. Marketing activity provided over 250,000 referrals[34] to local services in 2009/10, approximately a third of total service throughput[35]. For those people who were unwilling or unable to access a service, we provided information and remote support, for example through the Smokefree Customer Relationship Management (CRM) programme, which increased quitting success rates among participants by 57%[36].

10.7. However, as the majority of smokers attempt to quit without support, we launched the new 'Quit Kit' product in January 2010, which offered 'a quit attempt in a box'. The Quit Kit incorporated insights from research and behavioural economics to prompt quit attempts and introduce the idea of using NHS support. Nearly 500,000 orders were placed for the Quit Kit in January to March 2010, (boosting orders for support materials by 500% versus the offer of a DVD previous year). 95% of orders were from people who had not previously responded to national marketing. Follow up research demonstrated that the Quit Kit had a strong impact on those who ordered it, with over 80% of people taking some action towards quitting as a result and nearly 60% making a quit attempt (29% reported that they visited a doctor about giving up smoking, 17%that the spoke to a pharmacist and 11% that they visited a local stop smoking service).

10.8. Econometric modelling has demonstrated a clear relationship between tobacco control marketing activity and people quitting smoking. In 2008 and 2009, tobacco control marketing activity directly stimulated over 1.5 million quit attempts (around a third of the total annual quit

[33] BMRB Tracking research, Autumn 2009, Smokefree Generation campaign.
[34] This includes contact details of 90,000 individuals which have been passed to the services as a result of marketing activity and 160,000 people who have requested and been given details of their local service. Based on actual figures and estimate to end March 2010.
[35] Approx. 750,000 people set a quit date in 2009/10 with the NHS services (based on actuals in Qs 1 to 3 and an estimate for Q4 as figures not yet available.
[36] COI/Artemis analysis. CRM response. The self-reported quit rate was 52% for CRM and 33% for Control, an increase of 57%.

attempts) and over 100,000 successful quits[37] in each year. The gross one year payback of the campaign in 2009 was £43m[38], in terms of savings to the NHS. After subtracting the costs of campaign spend and providing the stop smoking services to those who used them as a result of marketing activity, this results in a one-year return on marketing investment (ROMI) of £2.07 for every pound of public money spent, and a three-year return of £4.58 for every pound spent.

How the strategy will change

10.9. However, there is more to be done. The environment is becoming more challenging, in part due to the stress and uncertainty created by the current economic climate (which causes people to rely more on everyday "props" and to put off making any significant commitment to change until a time of greater stability).

10.10. The national ambition, set out in the recently published Tobacco Action Plan is reduce smoking prevalence from its current level of 21% to 18.5% or less by the end of 2015, equating to around 210,000 fewer smokers a year.

10.11. 63% of smokers[39] say they want to quit (down from 72% in 2000), however fewer than four-in-ten (36%) go on to make a quit attempt in any given year[40].

10.12. Recent figures from tracking research suggest that motivation to quit is in decline, with the number of people saying they do not want to quit at all at 30%[41], its highest level since tracking began in 2007. Over recent years there has also been a year on year decline in people making quit attempts, from 43.5% people making a quit attempt in 2007 to 35.8% in 2010[42].

10.13. A key focus for national marketing activity therefore will be to maintain the importance of quitting at the forefront of people's minds, reminding people of their reasons for wanting to quit and seeking opportunities to increase the number of quit attempts among all smokers.

10.14. As part of this, we will work with healthcare professionals to ensure they have access to the latest evidence on the harms of smoking, the effectiveness of the various routes to quit and that they are aware of the important role they can play in prompting quit attempts. This will support system changes, which aim to make referrals of all smokers to support services routine.

---

[37] All adult figures, based on direct response to marketing activity and estimated quit rates. Routine and Manual smokers comprise approximately 52% of all adults.

[41] TNS-BRMB Tobacco tracking data, All Smokers, Oct 2010.
[42] Key findings from the Smoking Toolkit Study, Prof Robert West & Dr Jenny Fidler, University College London, Feb 2011.

10.15. Nationally, we will continue to assist smokers to quit through providing information, products and services, for example, helplines, the Smokefree website and Facebook site and products like the Quit Kit. These will signpost people to the most effective forms of quitting (in particular the stop smoking services), while respecting their individual preferences.

10.16. We know that the majority of people attempt to quit without support. We therefore need to focus on these 'cold turkey' quitters and develop communications and products to reach them and encourage them to make effective quit attempts. The Quit Kit was a good example of this approach – targeting and supporting cold turkey quitters, while making sure people were aware of the additional support available to help them quit successfully. In follow up research, many people reported that they went on to take up this support.

10.17. For smokers who are not yet ready to quit, we will explore ways in which we can help them to take steps towards quitting, for example through encouraging people to make their homes and cars smokefree, and signposting them to new service options which allow them to quit more gradually.

10.18. Given the new ambition to reduce rates of smoking throughout pregnancy to 11% of less by the end of 2015, we will continue to support pregnant smokers, as smoking during pregnancy can cause serious health problems for both mother and child.

A partnership approach

10.19. The evidence suggests that many voices repeating the same messages in the same way, but adapted to the needs of specific target audiences will have the greatest effect. In addition to work with healthcare professionals, we will aim to work with a wide range of partners across the public, private and third sectors to achieve common goals. This could include other government departments, businesses, charities and NGOs and employers

10.20. We will also build on work to galvanise local social marketing efforts and ensure that national and local initiatives work together to achieve maximum impact. At a local level, the role for marketing will increasingly be to focus on specific local communities where prevalence is higher (e.g. ethnic minority groups), as well as tackling any specific local issues such as illicit tobacco. There will also be a greater local role in driving awareness and throughput to the services that can help people quit. Key partners will include for example, local authorities, local Stop Smoking Services, schools, workplaces and local businesses. We will minimise duplication and make the best use of resources by sharing messaging, research learnings, evaluation, best practice guidance and other materials, such as templates, via the available channels, to ensure that partners have access to relevant information and resources.

10.21. We will also explore new themes, for example reducing the exposure to secondhand smoke and reducing the uptake of smoking in young people.

10.22. Smoking in indoor public places and workplaces is now a thing of the past, however exposure to secondhand smoke at home and in private cars remains a significant cause of

death and disease. We will use insight to developing impactful messaging around the harms of secondhand smoke. We will also explore ways of helping people protect their families and communities from the harms of secondhand smoke. This is particularly important for children, who are especially vulnerable to the health harms from secondhand smoke. This could involve community led social norming initiatives and/or providing information and practical tools to help people make their homes and cars smokefree.

10.23. The highest rates of smoking are among young people. Around 28% of people aged 16-24 smoked in 2008. While smoking rates have reduced considerably in recent years, this continues to be a serious problem. An estimated 320,000 young people under the age of 16 try smoking each year in England, and around 6% of pupils aged 11-15 were regular smokers in 2009 (defined as one cigarette a week)[43]. Almost 2/3 current and ex-smokers say they started smoking regularly before they were 18 (39% before age 16)[44].

10.24. While many young people try smoking, only a minority of those smoking go on to become regular smokers. Given the new ambition to reduce rates of regular smoking among 15 year olds to 13% or less by the end of 2015, we will explore ways to support young people in making informed choices and supporting them to act on these by building their resistance skills as part of a cross public health approach to young people. This is likely to involve digital media because of its reach and popularity with the target audience. We will also explore the role of image and influencers on take up of smoking (including parents) and norming approaches that reduce the visibility of smoking and position it as a minority behaviour.

10.25. We will continue to take an insight driven and evidence based approach to developing social marketing initiatives, while also learning from emerging thinking, for example behavioural economics, to develop innovative approaches to influencing behaviour. Where the evidence base is still developing, we will take a test, learn, refine approach to trial ideas to understand their effectiveness. The emphasis will be on efficiency and effectiveness and working within available resources to achieve the greatest impact and value for money. We will publish a new three year marketing strategy for tobacco control in the Spring 2011.

[43] NHS Information Centre (2010). Statistics on Smoking: England, 2010. NHS Information Centre, Leeds.
[44] Smoking and drinking among adults: A report on the 2009 General Lifestyle Survey, Simon Robinson and Helen Harris, Office for National Statistics, Crown copyright 2011.

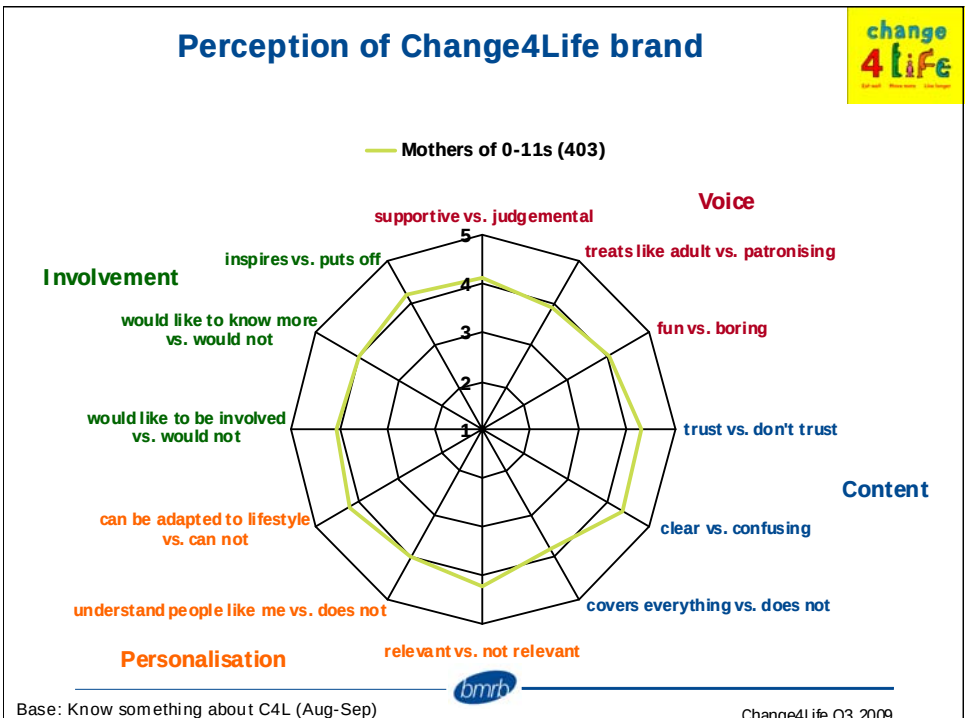
11. Applying the strategy: How Change4Life will evolve

Summary

Change4Life (and its sister brand, Start4Life) will become the sole branded programme for all healthy lifestyle information, products and tools for families and for adults in mid-life.

It will support people in making those small, sustainable yet significant lifestyle changes that lead to improved health outcomes.

Its scope will expand to include all advice related to diet and physical activity as well as much of the communication and marketing around drinking above the recommended guidelines.



Should there be future requirements for marketing to these age groups on topics that are currently out of scope (such as tooth decay), Change4Life will be the recommended brand for these topics

History

11.1. The Change4Life social marketing programme launched in England in January 2009. Originally developed as part of the childhood obesity prevention strategy, it targeted parents of children aged between five and eleven, particularly those from segments of the population where parental attitudes, beliefs and behaviours indicated that their children were most likely to gain excess weight.

11.2. Whilst Change4Life is government-instigated, it sought to inspire a broader societal movement, through which everyone who has an interest in combating obesity could work together under a common banner. Partners, whether commercial sector, NGO or from within local communities, were encouraged to support Change4Life, create their own initiatives and join these up with the national brand. The brand identity and creative assets were designed to be “open source”, i.e. others could use and build upon them.

11.3. The first year of Change4Life was extremely successful. Awareness of the brand built rapidly and attitudes towards it were (and remain) very positive.

11.4. Over 400,000 families joined Change4Life in its first year and over a million mothers claimed to have made changes to their children's behaviours as a direct result of the programme[45].

11.5. 2010 was a year of consolidation. Support from local and commercial partners grew substantially and the campaign expanded into new channels, for example through social media.

11.6. In January, materials for parents of very young children were launched via a new sister brand (Start4Life) and, in February, a separate programme launched for adults in mid-life. In March, the Welsh Assembly launched the programme.

11.7. To date Change4Life has been able to fund a substantial amount of activity, within a relatively narrow field of operations (principally diet and physical activity for the under elevens, although activity targeting adults in mid-life and parents with children under two did launch immediately prior to the Restricted Period).

11.8. Going forwards, the programme will also need to address adults and the topic areas will expand. It will require a new funding model, involving a step-change in the contributions made by partners.

11.9. The original Change4Life marketing strategy was guided by a substantial programme of research, including ethnographic research (during which social anthropologists lived with target

[45] *Change4Life: One Year On*, HM Government, 2010.

families, to gain deep insight into their behaviours and the reasons for their behaviours). This research was originally conducted in 2007. At the end of 2010, we reran this project, using the original researchers but with new families from within the target demographic

11.10. The research found considerable change among the family audience, driven in part by programmes such as Change4Life, but also by the broader climate of economic and political change. This strategy responds to the findings of that research, in particular:

- Families appeared to be taking greater personal responsibility and to be pulling together, both in extended families and across communities, in ways that they were not doing in 2007.
- The researchers reported evidence of a societal movement for healthier lifestyles, including substantial change to beliefs about what constitutes good parenting. Change4Life was one instigator of this movement, but not the sole instigator.
- Target parents now aspire to have a healthy as well as a happy child, and the definition of healthy has evolved to include preventative measures such as physical activity.
- Children (and schools) are acknowledged as important change-makers within the family unit, although there was also visible evidence of parents (and grandparents) continuing to model poor behaviours, and underestimating the impact of this upon their children/grandchildren.
- Many parents have tried to implement change, and among some families there is evidence of these changes become normalised (i.e. “it’s just what everyone does now”).
- However, the research provided a timely reminder that behaviour change is hard. Some parents had tried to implement healthier lifestyles, failed, and then rejected the concept as too difficult. Others in the study struggled to sustain change, particularly in the face of an adverse environment.
- Change4Life has landed very well with parents, and was appreciated as a resource within a wider societal movement. However, there was a perception that Change4Life had “receded” (particularly due to the cessation of television advertising) and parents expressed a real need for new and fresh products and tools to help sustain change. They particularly valued resources that were tactile, interactive and fun to use.
- Finally, target families had embraced new technologies, particularly gaming and social networking.

How Change4Life is changing

11.11. Going forwards, Change4Life will embody a more holistic approach to health, for example by incorporating messaging that has no specific obesity-benefit (such as salt reduction).

11.12. It will broaden out from its focus on children to also include lifestyle advice for adults, particularly in mid life (and therefore at greatest risk of developing long term illness), whether or not they have children.

11.13. Within families, recognising that parental (and grand-parental) modelling of poor behaviours continues to have a negative impact on children, it will take a whole-family approach to change, by, for example, introducing family “Energy Contracts” (an agreement between parents and children to both adopt more positive behaviours) as part of a collaboration with the children’s television programme Lazytown.

11.14. We will explore the possibility of using the insight that children aspire to the behaviours they see in their parents to encourage parents to model good behaviours, such as drinking within guidelines and delaying initiating their children into drinking alcohol until at least age fifteen.

11.15. There will be a radical step-change in the proportion of the campaign that is funded by partners. Contributions from the commercial sector are targeted to increase from £9 million in 2009/10 and £12 million in 2010/11, to a target of £15 million in 2011-12. To facilitate this, the Change4Life Retail Guidance has been revised to allow partners to promote a greater number of product categories.

11.16. While in-kind contributions will continue, we also anticipate a revenue from sponsorship sales of £2 million in 2011/12.

11.17. There will be fewer centrally-led initiatives, but those that are centrally-funded will be regularly-occurring calendar events, to provide partners with advance warning so that they can plan their schedules of activity and better join up with the programme. These include the New Year Great Swapathon, Walk4Life and the Summer of Fun.

11.18. In addition to the support Change4Life has received from commercial organisations, there are already over 47,000 “local supporters”: public-spirited individuals or professionals who are passionate about creating change within their communities. The new strategy will involve a reversal of the relationship between these people and the central Change4Life team: a shift from them being asked to support Change4Life to Change4Life increasingly asking what it can do to support them. Our research with local supporters indicates that many operate in other lifestyle areas and we should seek to provide them with whatever materials (including alcohol or drugs) they require. This places local people at the centre of a societal movement for better health, in keeping with the spirit of the Big Society.

11.19. There will be more locally-funded initiatives, and, to facilitate this, money from the central funds will be devolved out to local communities to provide seed-funding for new initiatives.

11.20. The Change4Life programme is one of the most responsive campaigns ever monitored by COI Artemis and has generated a citizen database of over 525,000 plus a local supporter

database of 47,000. Ongoing with communication with these people, who have opted in to positive change (and through them, with their social networks) is key to inspiring and maintaining positive change. Previously we ran two, occasionally intersecting, customer relationship management programmes, one on-line and one paper-based. Going forwards, we will create one integrated programme, which uses the strengths of on line (ability to deliver frequent communication to large numbers at low cost, instant feedback and interactivity) with printed materials for crucial stages only (e.g. action plans).

11.21. Social media allows our target audiences to enter easily into relationships with us: a “like” earned on Facebook takes only a single mouse click, but gives us permission to provide content and updates to the individual for as long as the like remains. This is a longer-term proposition to a more traditional response (such as telephoning an information line or ordering a leaflet). Consequently, Change4Life’s Facebook presence (which currently has over 47,000 “likes”) will expand, to allow for more co-creation, interactivity, sharing and feedback. Partner support will be integrated into the CRM programme (by, for example, allowing on line users to access vouchers for money off healthy products).

11.22. Recognising that many of the Change4Life target audience are kinaesthetic learners (i.e. they prefer to learn by doing, rather than by reading), we will focus more on interactive, practical tools and less on didactic, wordy leaflets. We will also pilot an experiential programme to allow people to try unfamiliar foods and activities.

11.23. The Start4Life sister brand will continue to be promoted and will expand to cover maternal health in pregnancy (and, when feasible, pre-pregnancy), for example alcohol in pregnancy, and all other advice and information relevant to early years (such as immunisation)

11.24. The strand of activity that addresses adults in mid-life will recommence and the alcohol health harms messaging will be brought more fully under the Change4Life umbrella, embracing not only calorific content of alcohol but also the wider health harms of alcohol. As part of this, we will expand our partnership engagement strategy to include the relevant NGOs, Drinkaware and, if they are willing, the alcohol manufacturers and retailers.

11.25. There are messages and materials relating to drinking above guidelines that will need to be provided outside of the Change4Life campaign. As well as working with Drinkaware and others, we will set aside a portion of resources to develop alcohol-specific messaging within the young people’s strand and messaging around the impact of drinking above guidelines upon common health conditions, as part of the older people strand.

11.26. Paid-for media, such as television advertising, will recommence, but as a far lower proportion of total spend than in 2009

12. Applying the strategy: A consolidated approach for the over 60s

Summary

There is great potential to improve health outcomes for people aged over 60 through a combination of active ageing and a recognition of the signs and symptoms of common conditions (leading to earlier presentation to the health service).

We will devote a greater proportion of our resource to this age group and will gain synergies and efficiencies through bringing previously separate campaign strands into closer alignment, under the trusted NHS brand.

This activity will challenge the expectation that mental and physical deterioration and reduced quality of life are an inevitable part of the ageing process and seek to empower older people (and, where appropriate their carers) to seek prompt diagnosis and medical attention across a range of conditions.

Note: Throughout this document, we have used the term “older people” to refer to people aged – approximately – over sixty. We recognise, however, that conditions such as cancer or stroke can occur much younger in some individuals and later (if at all) among others. Also that "people aged over sixty" are a large and diverse group and that many people who fall within it would not define themselves as “older” and certainly not as “old”.

12.1. Illnesses that disproportionately affect the over sixties account for a very significant proportion of healthcare and other costs. Dementia alone costs the UK economy £17 billion a year and, in the next 30 years, the number of people with dementia in the UK will double to 1.4 million, with the costs trebling to over £50 billion a year[46].

12.2. Stroke costs the NHS and the economy about £8 billion a year, including £3 billion in direct care costs[47].

12.3. Earlier diagnosis and, in the case of stroke, fast access to services, has the potential to improve survival rates, extend the number of years lived in good health and save money for the taxpayer, individuals and society.

[46] *Living well with dementia: A National Dementia Strategy* February 2009.
[47] NAO report into stroke services, February 2010.

12.4. Helping older people to remain active benefits the whole of society, not just through reduced healthcare costs but through the economic benefits of older people working longer, and through other forms of participation that increase social cohesion, such as volunteering.

12.5. Despite this, marketing and communication on these topics has historically been a relatively low proportion of our overall efforts to help citizens improve their behaviours.

Driving insights for health behaviours in older people

12.6. The following are the driving insights that have informed our approach to older people marketing:

- Many older people see self-reliance as a virtue, with a strong desire and sense of pride to manage on their own and maintain an independent lifestyle[48].
- Fear can play on the minds of older people, including fear regarding their future health, that diagnosis will identify a problem that will inevitably lead to a 'loss' of control over their life (lifestyle & independence) and a fear that each set-back brings you closer to death[49]
- Consequently, avoidance and denial strategies are common, for example:
    - feeling that what you don't know you can't worry about;
    - finding out more will only lead to new worries;
    - preference to stay deliberately ignorant as knowledge might confirm that fears have some basis;
    - avoiding thinking about things in case they tempt fate;
    - downplaying how bad things are and a reluctance to admit to physical impairments[50].
- Additionally, among groups such as the Unconfident Fatalists, there is no positive expectation that seeking support and help will necessarily lead to better outcome. There is often a feeling that it is too late to improve one's health and that getting help will only lead to increasing levels of care and loss of independence – a belief that physical and mental decline is just to be expected as part of the ageing process[51].

[48] COI Common Good Research "Communicating effectively with people 50-75", Stimulating World, 2006 and COI Common Good Research "Communicating effectively with older people 76+", Forum, 2006.
[49] Ibid.
[50] Ibid plus NHS Health Checks Vascular Risk Assessment Programme Research Report, Commissioning Support for London, 2009 and Qualitative Research Concerning Attitudes to Dementia, Corr Willbourn, 2009.
[51] Ibid.

- The taboo on discussing death and dying means that people do not express their wishes and preferences, so may not get the care they want. Conversely, they may receive interventions they would have refused given the choice.

- There is often a reluctance to make demands on the health system (e.g. 'not bothering the doctor'), because of a desire not to be a burden on resources when there are others more deserving because of greater need. With many men from lower socio-economic groups, it is sense of pride that drives reluctance to use services, especially if symptoms are perceived to be trivial[52].

- Older people can feel guilt at not be able to cope and having to ask for help. This is especially strong amongst informal carers looking after close relative, which can mean help is not sought until a crisis point is reached. Some groups, such as smokers, can feel guilty that their condition is in some way deserved ('of course I have a cough, I've smoked for 40 years') and that they may be blamed by health professionals if they do seek help.

- Despite this, older people often have a strong and trusting GP relationship (28% of over 75s have seen a GP in last 2 weeks[53]). However GPs are often perceived to be too busy and there is often an assumption one should only visit them when seriously ill[54].

- There do appear to be some key motivations that lead older people to engage with their own health and overcome health problems e.g.:

    - that the advice or treatment is perceived to be likely to result in a better outcome, helping them to maintain their lifestyle/independence[55];

    - prior personal contact with the illness of concern[56];

    - perceived seriousness of illness;

    - meaningful relationships and perception of a role/meaning in life[57].

- There are a number of other key influencers on the way many older people engage with their health, particularly local informal social, who become advocates, sharing knowledge and information about help and services. Women are often an important influence on men in terms prompting them to seek advice[58]. Proximity of friends and family is also a key

[58] Ibid plus NHS Vascular Risks Assessment Programme Research Report, Commissioning Support for London, 2009.

factor in health engagement and culture and religion are often a strong influence, particularly for ethnic minority groups.

- There are a number of trigger events that can be important in prompting consideration of older people's health, such as reaching milestone ages (such as 60) and the death of a partner or close relative, which can trigger 'giving up to old age'. Retirement is too often viewed with trepidation, sometimes seen positively as a time of new opportunities, but often in a more pessimistic light – an end of socialisation and structured working life[59].

12.7. These insights hold true across for many over 50s, although there are variations among different sub-groups of the older population. For example, those born before the Second World War are more likely to resist the idea of state assistance compared to the post war generation, who are more likely to assume and assert their rights to state support[60]. It is helpful to view ageing as a dynamic process with people moving between positive and negative mindsets, depending on their state of health which varies through time.

The role for social marketing

12.8. In two main ways, marketing has significant potential to extend quality and quantity of life (and save healthcare costs) by achieving behaviour change in older people.

12.9. First, we should use marketing to encourage people in late middle-age (50-60) to adopt healthy preventative behaviours (such as eating healthily and exercising), which this group can assume to have little influence on health outcomes later in life. This will be done within the adult strand of the Change4Life brand.

12.10. Second, health economics suggest that overall healthcare costs can be substantially reduced by encouraging over 60s to present much earlier for diagnosis on a range of conditions[61], which they are often reluctant to do, again because of attitudes relating to the ageing process.

12.11. Currently, the Department delivers the above two marketing roles via several behaviour change campaigns largely aimed at the same older audience, but across different issues (e.g. cancer early diagnosis, stroke, dementia and Keep Warm, Keep Well). Bringing all these conversations together in a co-ordinated way with a life course approach has significant potential to be both more effective and more efficient.

12.12. In terms of effectiveness, having one consistent conversation with older people around the general issue of taking a positive approach to ageing will probably leverage more behaviour change than a series of fragmented conversations broadly addressing similar health motivations.

---

[61] See for example Richards, M.A. (2009) *The size of the prize for earlier diagnosis of cancer in England.* British Journal of Cancer; 101(suppl. 2): S125–9.

12.13. For efficiency, bringing a range of issues together via ‘one voice’ for older people, offers the potential to reduce the fixed costs of running numerous different campaigns.

12.14. The proposed marketing strategy for developing a single health behaviour change conversation is included below.

Strategy

A single health voice for older people

12.15. Over the next three years, we propose to migrate all the separate health marketing campaigns targeted at older people into one integrated campaign under the NHS brand, which will take a more holistic approach to health and wellbeing in later life. This activity will challenge the expectation that mental and physical deterioration and reduced quality of life are an inevitable part of the ageing process and seek to empower older people (and, where appropriate their carers) to seek prompt diagnosis and medical attention across a range of conditions.

A ‘kick-start’ approach to marketing

12.16. The role for marketing will be to ‘kick-start’ increased societal awareness of an issue in a positive and motivating way as an essential pre-cursor to subsequent marketing activity, which will be primarily locally driven, such as encouraging the take-up of advice and diagnosis services.

12.17. This means our marketing effort for older people will focus on raising priority issues up the societal agenda (as happened with the FAST campaign on stroke) and then developing creative assets once at the centre, which can be made available to Local Authorities (with the facility for them to be adapted for local use). This approach will avoid wasteful duplication of creative assets in the health system. Additionally, the production of central assets will mean they have critical mass to be pre-tested and evaluated for proof of concept before rolling out, which is not always possible with smaller scale fragmented activities.

12.18. The strategy will also realise the significant opportunity to save marketing money by facilitating better sharing of existing marketing assets in the health system, such as websites and helplines targeting health information and advice at older people.

Working across government

12.19. Given the need for health marketing aimed at older people to set behaviour change in the context of a positive attitude to ageing, there is a need to ensure a joined-up marketing approach with other government departments targeting the same audience. The older people health strategy will engage particularly with DWP, where there is significant potential to realise marketing synergies.

An engagement campaign for general practice

12.20. GPs are a critical intermediary audience for engaging older people, who generally have high levels of contact and trust with their GP across a range of health issues.

12.21. Working in partnership with the Royal College of General Practitioners, Public Health England will develop an engagement plan targeted at older people. This will include providing resources that help to persuade people at the younger end of the age spectrum that it is not too late to engage in preventative behaviours as well as resources to encourage early diagnosis, particularly for over 65s.

12.22. Being diagnosed with a long-term condition, while stressful and upsetting for a patient, is also a key teachable moment, at which the GP has the opportunity to explain how lifestyle changes (such as drinking less alcohol, giving up smoking or being more physically active) can make living with that condition easier. We will ensure that current resources are fit for purpose and where necessary provide new resources for GPs to make these conversations easier (and to ensure that the patient has written materials or access to an on line resource) to refer back to.

Key messaging tasks

12.23. The aim is an integrated campaign, which will take a more holistic approach to well being in later life. Messaging will challenge the expectation that loneliness, physical and economic inactivity, mental and physical deterioration, and reduced quality of life, are an inevitable part of the ageing process. Messaging will also empower older people (and, where appropriate their carers) to seek prompt diagnosis and medical attention. The key elements of behaviour change messaging to support the above will be:

- Re-setting societal expectations about ageing into something positive – challenging attitudes to age and high levels of resignation to low quality of life.
- Encouraging preventative behaviours such as getting older people active.
- Working across government to promote working longer and other forms of social participation, such as volunteering.
- Raising levels of ‘symptom literacy’, encouraging people to recognise physical and mental changes and acting quicker to realise the benefit of better outcomes.
- Giving people ‘permission to ask’ for diagnosis and services, empowering them to take responsibility for demanding diagnosis and treatment as a matter of right – diagnosis needs to become a plan of action, not a death knell.

Partnership

12.24. Similar to the requirements for the youth audience above, the older people audience will require a partnership approach to join up the efforts of a very wide range of energetic organisations already seeking to address the health outlook and behaviours of this audience.

12.25. The health partnership for old people will be formed by Public Health England and will co-ordinate a coherent partnership strategy across government, commercial and third sectors to deliver a consistent approach to the messaging tasks summarised above.

13. Applying the strategy: A new approach for young people

Summary

Many people first try behaviours, such as smoking, drinking alcohol, having sex, or taking drugs, between the ages of 10 and 20.

Some of these behaviours bring an immediate risk of poor health outcomes and young people need to be aware of this; others can lead to future illness and premature death if they are maintained over time.

We know that we cannot prevent all risk-taking among young people. However, central government's role will be to create one integrated programme that seeks to build self-esteem, resilience and negotiation skills in young people, so that they are better equipped to manage those risky lifestyle behaviours, and prevent them escalating into lifetime habits.

Evidence from behavioural insights[62] is that this should not be a branded programme. Rather, we propose to work with and through those partners, commercial, charity and civic, who are already trusted by young people.

Local areas will take responsibility for driving traffic to local services. Brands and creative assets from previous campaigns will be made freely available to local areas to facilitate this.

13.1. People aged between ten and twenty do not themselves place an excessive burden on the health service.

13.2. However, the transition from childhood to adulthood is the time when many people try behaviours, including smoking, drinking alcohol, having sex or taking drugs, for the first time:

- Every year, approximately 320,000 people under 16 try cigarettes for the first time[63]; two thirds of current and ex smokers report that they started smoking before age 18[64].
- Data from national surveys of drinking behaviour in young people indicate that, by age 15, the vast majority of young people have had their first alcoholic drink[65].

[62] Cabinet Office (2010) Applying Behavioural Insights to Health: England 2010.
[63] NHS Information Centre (2010). Statistics on Smoking: England, 2010.
[64] 2009 General Lifestyle Survey, Simon Robinson and Helen Harris, Office for National Statistics, Crown copyright 2011.
[65] Guidance on the consumption of alcohol by children and young people, CMO report, 2009.

- The average age at which people first have sexual intercourse is now sixteen and three quarters[66].
- 15% of 11-15 year olds reported taking drugs in the last year[67].

13.3. For some, this truly is a "trial" – they experiment with risky behaviours, but adopt safer practices as they settle down, get jobs, start relationships and have children.

13.4. For others, however, what should be a phase, becomes a lifetime habit.

13.5. It is therefore vital that society equips young people with the skills, knowledge and resilience to navigate their way through this most difficult transition.

13.6. This is far more than a health issue. Building self-esteem and self-efficacy among young people is an objective for other Government departments, particularly the Department for Education (who have an interest in teenage pregnancy) and the Home Office (who have an interest in civic disorder and crime); its benefits would be felt across the whole of society.

Driving insights for health behaviours in young people

Note: most of the research and insight work commissioned by Government over recent years relating to health and young people has been issue-based (e.g. smoking, alcohol, obesity etc), reflecting the structure of health policy. Relatively little health marketing research and insight has been completed to date relating to young people holistically as a single audience. Developing this evidence-based insight will be a priority within our life course marketing going forward. In the meantime, building particularly on extensive and recent work completed by DCSF on young people's risk taking behaviour in relation to alcohol usage, the following are believed to be the driving insights behind many of the risky health behaviours exercised by young people[68].

13.7. There is considerable variation in social, biological and environmental influences between people aged 10-20 years old. Nevertheless, there are some general truths that very frequently recur when reviewing insight work that has been conducted recently with young people, for example as part of the development of the *Sex: Worth Talking About* campaign. Those most relevant to the health context are included below.

[66] National Survey of Sexual Attitudes and Lifestyles, 2000.
[67] Smoking, drinking and drug use among young people in England, 2009, Information Centre for Health and Social Care.
[68] Key sources for this section include: Department for Children Schools and Families (now DfE) Segmentation of children and young people and segmentation of parents and carers, both the Futures Company, 2009; Use of Alcohol among children and young people, Define, April 2008; Young People and Alcohol Customer Insight Desk Research, Edcoms, November 2008; Exploring parent-child alcohol engagement to inform the future alcohol guidance campaign, 2CV; Informing the proposition development of the young people and alcohol campaign, 2CV 2009; Young People and Alcohol Usage and Attitude Study, GfK NOP, 2009 and Young People and Alcohol campaign pitch and creative development research, Define, 2009.

13.8. For many young people, taking risks is enjoyable, due to the appeal of challenging authority, asserting an adult identity and the thrill of experimenting with new sensations.

13.9. Perceptions of risk change during adolescence for biological reasons, with the thrill-seeking emotional brain being more dominant in earlier years and the rational adult brain not developing until later.

13.10. Many more vulnerable young people fall into the “Live For Today” Healthy Foundations segment: the long-term seems a life time away (the phenomenon behavioural economists call hyperbolic discounting), so talking about health harms rarely resonates unless they are immediate.

13.11. Social norms are a powerful influence on young people, although overt peer pressure is rarer than their parents perhaps believe.

13.12. Parents, and the examples they set, are usually by far the greatest influence on younger people.

13.13. The parental and family factors that protect young people from risky behaviours include:

- a close family that communicates;
- eating meals together (at least 5 times a week);
- modelling of positive behaviours by parents;
- religious beliefs; and
- things to do/activities after school.

13.14. Yet parents often significantly underestimate their power of influence on the risk taking behaviours of their children, assuming that they are ‘not getting through’ or being ignored, when in fact this may only appear to be the case.

13.15. Risk taking young people share a number of negative features of their relationship with their parents:

- relationship with their parents is less positive than others – they argue frequently and lack respect;
- they do not speak to their parents about things that matter to them as frequently as other young people; and
- there is low parental involvement in their education.

13.16. Many young people have a driving desire to be seen as adults and the more they are told they are too young, the more they aspire to demonstrating adult behaviour.

13.17. Retaining control is often key for young people, in the sense that they demand autonomy and a say in the way they run their lives. Yet paradoxically, in other respects, they seem happy to lose control (or experiment with loss of control) through risky behaviours (e.g. binge drinking and drugs).

13.18. Attitudes to risk taking are often well on the way to being set as early as eight years old, after which they are hard to influence.

13.19. There are several key events that can trigger changes in young people's outlook on life, particularly the transition between primary and secondary school. Other milestone events include the onset of puberty and leaving full-time education.

13.20. There are also key times of the year when young people seem vulnerable to unhealthy behaviours, notably summer and Christmas holidays, when there is often much less structured activity in place.

13.21. Many risky behaviours among young people derive from a lack of confidence and aspiration (self esteem), which may be symptomatic of other problems and issues in their lives that need addressing in a wider context.

The role for social marketing

13.22. Much of the marketing effort directed at younger people over recent years has aimed to improve health across single issues through separate and parallel campaigns (e.g. campaigns on sexual health, obesity and alcohol consumption), all often competing for attention with the same youth audience. The development of these campaigns has generated a rich body of insight into young people, much of which points to a common set of behavioural influences that are higher level pre-requisites for behaviour change across most risky health behaviours. These higher level needs suggest there are three basic roles for marketing:

- Marketing has a role to play in changing social norms by galvanising a wide variety of partners to promote positive images of health behaviours in society as opposed to negative ones. For example, the recent decline in smoking among children seems partly attributable to the decreasing number of situations in which adults are seen smoking (either in real situations or portrayed in the media).

- Marketing has a role to play in facilitating stronger parental influence on children through better realisation of their role in shaping and avoiding risky behaviour by young people, and also providing strategies and resources for having courageous conversations that might not otherwise take place.

- By promoting activity, marketing can also play a role in facilitating self esteem and reducing the propensity of young people to drift into inactivity, which produces a vacuum in which there may be a desire to experiment with risky behaviours.

13.23. We recommend against traditional marketing campaigns (such as television advertising) for this audience. Instead, a new marketing approach is required for young people, built on partnerships rather than advertising and facilitating effective dialogue in preference to merely imparting information (although the latter is still required at a basic level). The use of social media and other technology-driven channels will be key to engaging with this audience.

Partnership-led marketing strategy

13.24. Many expert organisations are already working to influence health behaviours in young people. Some are already running campaigns on single or multiple issues (such as the “We are the 99%” campaign in London or the “Got Your Back” campaign run by Drinkaware in Newquay). The challenge for partnership marketing is to encourage and retain the energy of these organisations (which often derives from a passionate commitment to a single aspect of youth behaviour), whilst at the same time enabling synergy to be realised from joining up previously fragmented efforts.

13.25. The cornerstone of the young people’s marketing strategy will be the formation of a partnership, co-ordinated by Public Health England, which achieves the following:

- Draws together youth public sector and private sector partners from education, health, the police, commercial, local and third sectors into an effective “fighting force” to improve youth lifestyles over the long term.
- Defines and agrees a set of operating principles, so that all partners are supporting the same broad behaviour change priorities and approach.
- Specifically identifies individual organisational objectives into funded account plans.
- Manages each account to ensure delivery of plans and agreed resources.
- Evaluates what works well and less well so that future partnership activities are evidence based.

This partnership will be established throughout 2011 and will begin delivering marketing initiatives at the beginning of 2012.

Branding

13.26. At this stage we do not propose that a consumer brand is established to act as a rallying banner for the youth partnership strategy, since:

- there is a risk that anything perceived to be a big authority-led initiative to change youth behaviours might be cynically received or even ignored;
- many of the sensitive subjects relating to youth health behaviours do not lend themselves to a ‘big branded conversation’;

- the behaviour change issues to be addressed are all very different and require different tones of conversation, rather than the tone of voice of a single brand. FRANK provides some useful guidance here, where the focused intimacy of the brand derives in large part from it only discussing drugs;

- while the centre will no longer run single issue campaigns in this area, we will make available the brands and creative assets from successful programmes (such as FRANK and Sex: Worth Talking About) for local areas to use and adapt (within sensible guidelines) if they choose.

However, we will be engaging with stakeholders and potential partners in coming months to mine their experiences and to understand whether a branded entity would have value to them (for example as a sign that they are part of a bigger movement).

13.27. Although the partnership effort and its co-ordinating force is by far the most significant strand of the young people marketing strategy, other secondary strands will be required for the strategy to work as included below.

Information provision

13.28. Beyond marketing, there will still be a need for information provision, as part of our responsibility to young people. This extends to giving advice to the most vulnerable young people, including those in crisis. Where current resources, such as the FRANK help line and website, have established credibility with young people, or with their parents, we will maintain them. However, we will seek to deliver greater efficiencies and cost savings.

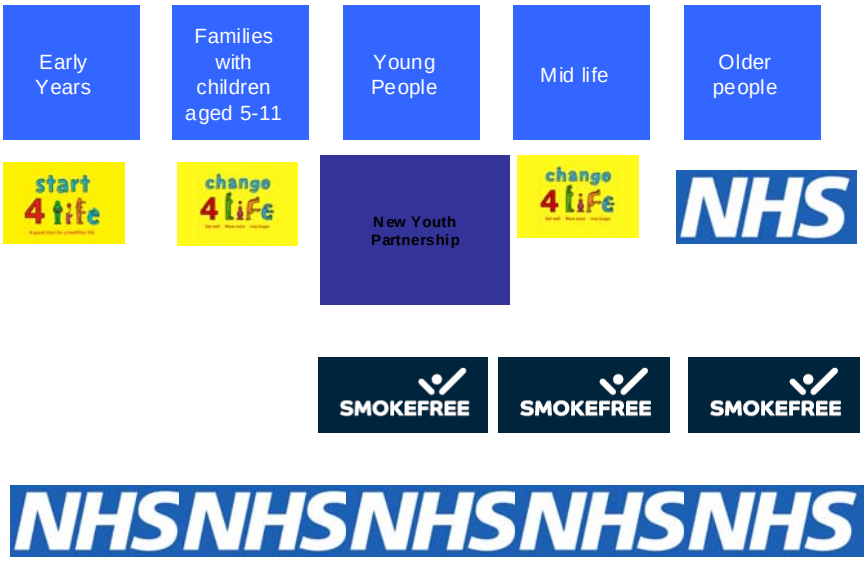
13.29. We recognise that Government may not be the most trusted source of information for young people (and for many other vulnerable or at risk groups). We will therefore continue to work through trusted charities and networks, such as Terrence Higgins Trust and the African HIV policy network, to ensure information can be accessed where and in the format people find most useful.

13.30. Much of the health information, advice and guidance provided to young people needs to be woven into an interactive customer relationship management dialogue, which can either be web-based, or telephone. Additionally, the partnership needs to deliver a co-ordinated approach to the way face-to-face conversations take place (e.g. via routes such as The Family Nurse Partnership).

13.31. The job of pointing young people to health services (such as Chlamydia screening and brief interventions designed to reduce alcohol consumption) will increasingly become the responsibility of local authorities and/or GP consortia, although there are undoubted efficiencies to be gained from ensuring collateral for these services are produced once only from the centre with the facility to tailor generic messages according to local requirement.

Behaviour change expertise

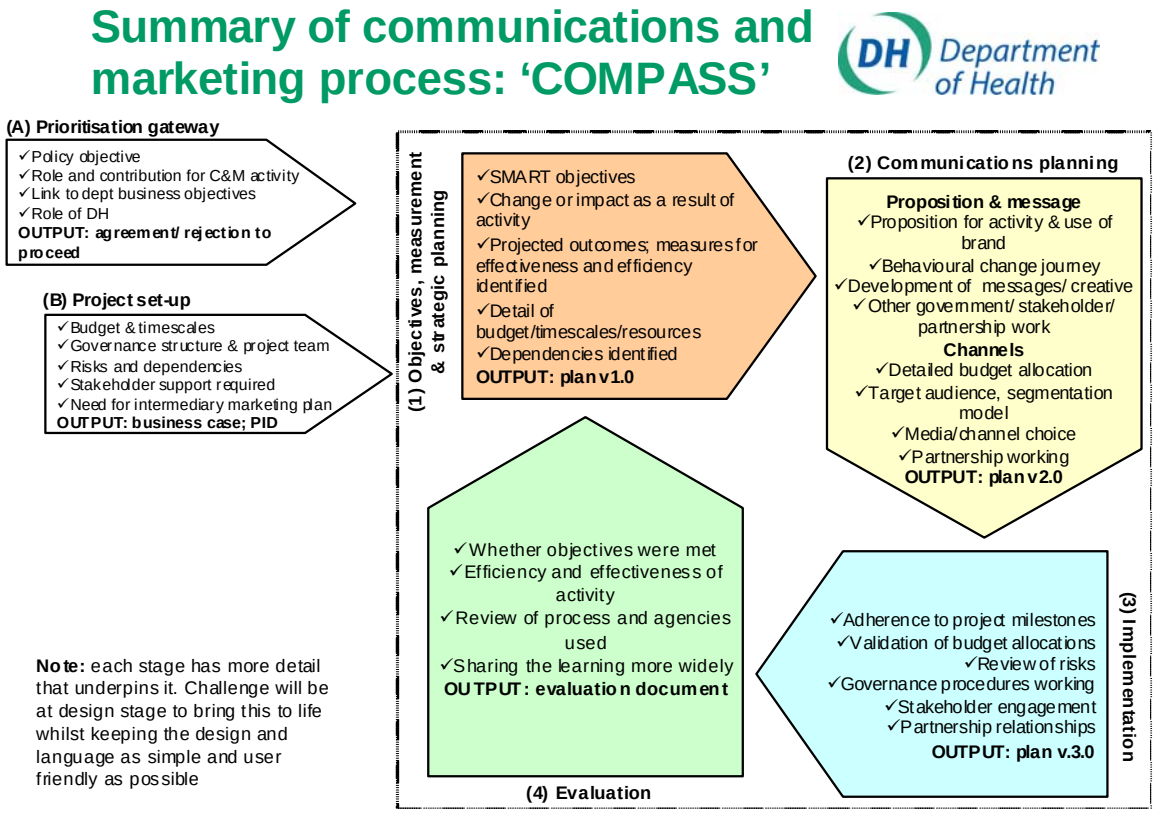
13.32. The partnership will need to include a range of youth behaviour change experts, specialising in relevant disciplines such as behavioural economics, neuroscience, risk psychology and studies of genetic predisposition to risk taking. All of these are fast evolving areas of expertise, which need to be joined up into a collective view of what constitutes best practice in influencing health behaviours and youth attitudes to risk taking. One example of a new and emerging approach to behaviour change that might be useful to youth audience is a 'reflexive' approach, where audiences are engaged in reflecting on their own behaviour change journey, the mere process of which has inherently beneficial effects per se[69].



13.33. In addition to academic input, the youth marketing partnership will also capture and share best practice from practitioners working in health behaviour change programmes (such as WeightWatchers, MEND and ASSIST) and will have access to all the knowledge and insight work (and commercial sector data) obtained through the development of past Department of Health campaigns (such as *Sex: Worth Talking About and Talk* to FRANK).

[69] www.thersa.org/projects/social-brain/reports/changing-the-subject

14. Implications of the four programmes for our brand architecture



14.1. There will be far fewer nationally supported brands (although local areas may continue to fund single-issue brands, for example to drive traffic to services).

14.2. Through the life course, an individual's relationship with health sector brands should look like this:

15. Implications for how we work organisationally

15.1. The Department of Health already recently introduced a thorough and professional process for developing and implementing social marketing programmes (see below) and this process will continue to be used going forwards.

15.2. However, the strategy has profound implications for how the marketing function is organised within DH, how it interacts with marketing and communications services across Government, with partners and with agency suppliers.

15.3. The DH is already engaged in an organisational change process, with the establishment of Public Health England and the NHS Commissioning Board.

15.4. Historically, there have been marketing personnel based both within DH and, centrally, in the COI. All agency services were procured via the Central Office of Information (COI)'s rosters and contracts were held with the COI, not the DH.

15.5. Recently, the Cabinet Office published its Review of Government Direct Communications and the Role of the COI. This review recommended:

- The creation of a new Government Communications Centre (GCC), based in Cabinet Office, to develop the Government's communications strategy.
- The brigading of Government Communications into a small number of themes, delivered by dedicated theme teams.
- An invitation to agencies, media owners and voluntary and community organisations to join with Government in forming a Common Good Communication Council, which would invite suppliers to bid for contracts for free or near free.
- The development of a new governance structure to include (subject to approval by the Prime Minister) a Cabinet Sub-committee on Communication and a Government Communication Oversight Panel.
- The retention of a centralised procurement function within the GCC.

15.6. This review will have profound implications for how we organise our resources and procure suppliers and we will work closely with the Cabinet Office in the implementation of its recommendations.

15.7. The review makes clear that there will also be fewer people to manage social marketing programmes in future. At the same time, the skill sets required to manage these programmes are changing. In particular, there will be a greater need for:

- business analytical skills;
- client service, sales and negotiation skills (to broker and manage relationships with the commercial sector and other stakeholders);
- consumer understanding and insight mining;
- understanding of behavioural economics and social psychology;
- idea generation/new product development;
- legal support;
- financial support.

Some of these skills are abundant within the civil servant workforce, but others, particularly those involving working with the commercial sector, are less common. This provides opportunities for career development and we will put in place a training and development programme to upskill the workforce for the coming challenges.

15.8. In addition, we will still need to procure the following from external suppliers.

- Channel planning
- Delivery of creative work
- Research
- External evaluation

15.9. To date, external agencies have been appointed to work by campaign and by channel, with competitive pitches held for each appointment. This was intended to ensure a fair and transparent process. However, it has resulted in a large number of agencies (there were seven, plus the COI, appointed to Change4Life alone), which in turn results in duplication of cost and fragmentation of knowledge. In future, we will seek to procure fewer agencies, but with deeper relationships, so that synergies can be build and knowledge preserved. The recently announced restructuring of COI's rosters will aid this.

15.10. Moreover, while contracts are held by organisations, it is often highly skilled and visionary individuals who develop our more successful marketing strategies. These individuals can be hampered by the organisational structures in which they work.

15.11. We need to create a procurement mechanism that enables individuals, irrespective of where they are based, to work together in blended teams for the good of the marketing programme in totality.

15.12. We will work with the Cabinet Office to pilot new ways to increase the use of payment by results for our activity. This should be applied in two different ways:

- Ensuring that a proportion of all agencies' fees is dependent upon the delivery of work that meets the client brief and achieves the communications objectives outlined therein. This is standard best practice and should be the norm for all communications activities.
- When feasible, inviting providers to tender for Government communications contracts on the basis that payment will be for the outcomes achieved (for example, inviting providers to deliver a set number of people setting a quit date at an agreed cost per person).

16. Indicative Budgets for 2011/12

16.1. From April 2011, budgets for marketing and communication will be held centrally within the communications directorate.

16.2. Changing priorities for spend are reflected in the table below:

	2009-10	**20011-12**
Smokefree	£38 million	£15 million
Change4Life	£25 million	£14 million
Older People	£14 million	£11 million
Younger People	£16 million	£4 million

17. Evaluating the new strategy

17.1. In line with DH best practice[70], there will be a stand alone evaluation plan for all four marketing programmes, which will be devised in consultation with internal and external experts and stakeholders.

17.2. The success of this strategy will ultimately be measured by movements to the indictors contained in the Public Health Outcomes Framework. Since many of these indicators move only slowly and are influenced by many other factors beyond the control of marketing, interim measures will be identified to evaluate the impact of marketing programmes.

17.3. Each programme's evaluation plan will set out in detail the:

- Evaluation objectives.
- KPIs – devised in relation to the desired behavioural outcomes (and in line with best practice, ie output, outtakes, outcomes and impact).
- Methodology and data sources.

17.4. We will use a mix of methods, incorporating market research (qualitative and quantitative), commercial sector data (wherever possible, supplied for free as part of our partnership arrangement), online panels, search, buzz monitoring and website analytics as well as other surveys conducted by government departments and agencies, such as Health Survey of England. Our increased use of social media and digital tools will generate vast amounts of behavioural data, which will be used in tracking citizen behaviours.

[70] See *The DH Marketing Evaluation Handbook*, Feb 2009.

18. Reporting Back

18.1. It is our intention to maintain the approach outlined in this document for at least the next three years.

18.2. During this time, we will publish annual updates on how we have spent public money and on what has been achieved as a result.

19. Contacts

19.1. For more information, contact:

Sheila Mitchell	Deputy Director, Marketing

Appendix 1: Glossary of common marketing terms

Advertising	Communication in any medium (such as television, radio, newspaper or posters), that is funded by the advertiser and where the creative is supplied by the advertiser.
Advertorial	Communication that is funded by the advertiser but appears in the editorial style of the publication (sometimes called “Advertising Features”).
Customer Relationship Marketing	The process for continuing dialogue with existing customers, for example to sustain beneficial behaviours, who have usually agreed to continue (“opted in”) to such dialogue. Can be paper-based (as when written communications are sent to an existing customer base) or electronic (for example via email).
Digital Engagement	Any contact with the target audience via the internet, including websites, emails and contact on social networking sites.
Direct Marketing	Sending individual communication direct (for example by letter) to a customer.
Media partnerships	Working with a media owner, such as a newspaper or television channel, to develop content. Can be paid for (when the advertiser pays for advertising and receives editorial in addition) or non paid for (when the media owner supports the campaign pro bono).
Partnership marketing	Marketing activity where two or more organisations campaign together to support shared aims. Usually no money changes hands between them.
Response	When a member of the target audience responds to a marketing campaign, for example by going on line to find out more information, calling a help line or using a coupon.
Social Marketing	The systematic application of commercial marketing concepts and techniques to achieve specific behavioural goals relevant to the social good.
Social Media	Media that promote social interaction, using new and accessible technologies (such as social networking sites).
Sponsorship	The use of funds to deliver a product or service (for whose delivery the funding organisation gains credit, as in “The Simpsons, brought to you by Change4Life”).

Appendix 2: Proposed Indicators in Public Health Outcomes Framework

Vision: To improve and protect the nation's health and wellbeing and for improving the health of the poorest fastest
Healthy life expectancy
Differences in life expectancy and healthy life expectancy between communities
Domain 1: Health Protection and Resilience
Comprehensive, agreed, interagency plans for responding to public health incidents
Systems in place to ensure effective and adequate surveillance of health protection hazards
Life years lost from air pollution as measured by fine particulate matter
Population vaccination coverage (for each of the national vaccination programmes across the life course)
Treatment completion rates for TB
Public sector organisations with board approved sustainable development management plans
Domain 2: Tackling the Wider Determinants of Health
Children in poverty
School readiness: foundation stage profile attainment for key stage one
Housing overcrowding rates
Rates of adolescents not in education, employment or training at age 16 and 18
Truancy rate
First time entrants to the youth justice system
Proportion of people with mental illness and/or disability in settled accommodation
Proportion of people with mental illness and/or disability in employment
Proportion of people in long-term unemployment
Employment of people with long-term conditions
Incidents of domestic abuse
Statutory homeless households

Fuel poverty
Access and utilisation of green space
Killed and seriously injured casualties on England's roads
The percentage of the population affected by environmental, neighbour and neighbourhood noise
Older people's perception of community safety
Rates of violent crime, including sexual violence
Reduction in proven reoffending
Social connectedness
Cycling participation
Domain 3: Health Improvement
Prevalence of healthy weight in 4-5 and 10-11 year olds
Prevalence of healthy weight in adults
Smoking prevalence in adults (over 18)
Rate of hospital admissions per 100,000 for alcohol related harm
Percentage of adults meeting the recommended guidelines on physical activity
Hospital admissions caused by unintentional and deliberate injuries to 5-18s
Number leaving drug treatment free of drug(s) of dependence
Under 18 conception rate
Rate of dental caries in children aged 5 years
Self-reported wellbeing
Domain 4: Prevention of Ill Health
Hospital admissions caused by unintentional and deliberate injuries (1-5 years)
Rate of hospital admissions as a result of self-harm
Incidence of low birth weight of term babies
Breastfeeding initiation and prevalence at 6-8 weeks after birth
Prevalence of recorded diabetes
Work sickness absence rate
Screening uptake

Chlamydia diagnosis rates per 100,000 young adults aged 15-24
Proportion of persons presenting with HIV at a late stage of infection
Child development at 2-2.5 years
Maternal smoking prevalence
Smoking rate of people with serious mental illness
Emergency readmission rates to hospital within 28 days of discharge
Health-related quality of life for older people
Acute admissions as a result f falls or fall injuries for over 65s
Take up of the NHS Health Check programme by those eligible
Patients with cancer diagnosed at stage 1 and 2 as a proportion of cancer diagnosed
Domain 5: Healthy Life Expectancy and Preventable Mortality
Infant mortality
Suicide rate
Mortality rate for communicable diseases
Mortality rate all cardiovascular disease (including heart disease and stroke) in persons less than 75 years of age
Mortality rate from cancer in persons less than 75 years of age
Mortality rate from chronic liver disease in persons under 75 years of age
Mortality rate from chronic respiratory diseases in persons under 75 years of age
Excess seasonal mortality

Consumer Focus Board

Paper 6

Title: Future of NSMC

Purpose: For decision

Date of meeting: 10 February 2011

Responsible officer: John Bromley

Prepared by: John Bromley

Attachments: Annex A – Section 3 - Using a Company
Keeping it Legal – Legal forms for Social Enterprises

Document published by Social Enterprise London and Bates, Wells and Braithwaite 2003

Overview

1 This paper outlines:

- the evaluation process that took place to determine proposals for the future structure of the National Social Marketing Centre (NSMC);
- the business strategy for the organisation post April 2011;
- recommendation to the Board on the timescales for the transition of The NSMC from a business unit within Consumer Focus to a self-standing Community Interest Company limited by guarantee.

Action for the Board

2 The Board is asked to note and endorse the evaluation process that has taken place to decide the future organisational structure of The NSMC and that further planning takes place in order to create a Community Interest Company in the 2011-12 financial year.

3 That the Board also approve the development of a full transition plan for the June meeting which will include:

- a comprehensive business analysis against which the future viability of the CIC is assessed;
- a governance process to oversee the transition from Consumer Focus and separately the running and oversight of the CIC;
- a timetable against which to monitor the milestones progress towards the setting up of the new organisation.

Background

Who NSMC is and what it does

4 The NSMC is part of Consumer Focus and is *the* leading authority on behaviour change in the UK.

5 Its mission is to maximise the effectiveness of behavioural change programmes through policy, research and practice. Combining ideas from commercial marketing and the social sciences, social marketing is a proven tool for influencing people's behaviour in a sustainable and cost-effective way.

6 We work with organisations across government and across sectors to assist in commissioning and developing, behavioural interventions for social good.

History of The NSMC

7 The National Social Marketing Centre was formally inaugurated in 2005 as a joint partnership between the NCC and the Department of Health (DH). It's origins lay in the Choosing Health Public Health White Paper (November 2004) which recommended that social marketing be used throughout the DH and the National Health Service (NHS) to develop effective behaviour change programmes that would contribute to better health for the nation.

8 The primary remit of The NSMC was to build capacity of social marketing in England. Since its inception, The NSMC has achieved this objective and has been at the forefront of the creation of a growing social marketing sector that is equipped to meet demand for social marketing services at the local level.

The Relationship with the Department of Health, the National Consumer Council and Consumer Focus

9 Some of the NSMC's programmes have been funded by the DH Social Marketing Unit through a system of grants that have been paid firstly to the National Consumer Council and latterly (from October 2008) Consumer Focus. The grants which have been £2m to £3 million per annum have paid for the NSMC hosting costs and programme delivery. This grant mechanism will be discontinued from April 1, 2011. The NSMC has also been commissioned to produce work for other organisations in the public sector both at home and abroad which have amounted to £13million during the lifetime of The NSMC.

10 The NSMC is not a legal entity in its own right and is formally part of Consumer Focus. It is a business unit within Consumer Focus and shares services with the rest of the organisation such as finance, information technology, procurement and human resources. The Director of The NSMC sits on the Senior Management Team of Consumer Focus and reports to the Chief Executive Officer. However, The NSMC has its own brand and market identity and, because of the nature of direct funding, its own work programme which is externally agreed between The NSMC and the DH. Historically The NSMC has also had a degree of commercial freedom to attract additional clients and take on other behaviour change projects.

The key issues

A Who will pay when DH stops grant funding The NSMC?

11 Given that The NSMC cannot rely upon DH grant in the future, we have had to examine other sources of funding. It is not envisaged that Consumer Focus could should fund The NSMC. The NSMC therefore began a business development programme in June 2010 to evaluate how it would be able to continue without the DH support grant. To this end, The NSMC:

- Commissioned a marketing review of existing and possible future clients to understand the potential for new work post 2010.
- Developed a programme of work to determine the most effective future organisational/governance structure for the NSMC

12 From these work streams The NSMC has developed:

- A clear understanding in which sectors The NSMC can generate project income with a comprehensive understanding/listing of the number and types of clients who wish to work with the organisation moving forward
- A recommended organisational structure and governance process for the organisation

Business Strategy and overall direction for the NSMC

13 Previously the overall strategy and work of The NSMC was heavily influenced by the DH who were the major funders of the organisation. Clearly the future direction and strategy for The NSMC has to be heavily influenced by commercial and business issues/opportunities.

14 Our business development programme identified four core areas of commercial opportunity for The NSMC. These are:

Training - Many of our clients, customers and stakeholders agreed that The NSMC have developed the most effective and comprehensive suite of training tools available anywhere in the world. We have further developed these tools and will be offering on-line programmes as well as selective personalised training packages for organisations. The later may be delivered as stand-alone courses or as turn-key training programmes which will be used to generate additional work.

Strategic Consultancy - We have discussed the strategic consultancy opportunities available to The NSMC extensively with other government departments, European and international organisations. The NSMC now has contracts with the Pan-American Health Organisation (PAHO), The Department of Health Hong Kong, the Scottish Government and US-AID with others in the pipeline. We see our role as strategic and will not undertake a large number of social marketing intervention programmes. However, we do expect to develop consortiums with other organisations and accredited individuals to deliver a number of behaviour change programmes where strategic value is identified.

Research - Our research tools and expertise (including the Social Marketing Research Centre which holds all the behavioural research conducted at a national level), the on-line cost benefit tool and our experience in managing and directing national pan-European research programmes will provide income streams moving forward.

Commercial advantage of our tools, products and events - The NSMC will continue to update and develop its range of products and resources which aid users with the implementation of behaviour change programmes to take commercial advantage of our position as a centre of excellence for behaviour change at home and abroad. Resources include the on-line toolbox, guides to procurement, conducting research, policy development and evaluation. We will also develop our portfolio of seminars and conferences, some of which will be implemented through our on-line delivery platform to maximise market reach and reduce associated delivery costs.

15 In addition to these core programme areas, The NSMC will generate additional income through:

Membership Programme
During the development of its business plan, The NSMC hosted a series of focus groups and workshops with stakeholders across government, the third and private sectors to determine if these groups saw a need for The NSMC moving forward. There was universal agreement that The NSMC should continue to play the lead role on assuring the quality of social marketing and considerable support for a membership programme as one means of achieving this goal. The NSMC currently has in excess of 3,000 regular subscribers to its e-bulletin and is globally recognised as a leader in the social marketing arena. A programme comprising individual, associate and corporate memberships is planned.

Grants
As a Community Interest Company, The NSMC would be eligible for government and non-government grant funding domestically and overseas. Given the considerable Government support for the establishment of Community Interest Companies there are several start-up/establishment grants available for new ventures that The NSMC would be eligible for. As a CIC, the NSMC would also be eligible for international grant funding for project work (research and delivery) from international development funds, philanthropic trusts etc.

B What should be the organisational structure?

The Present Situation

16 The NSMC is a business unit within Consumer Focus, an arrangement which has provided the organisation with the following benefits:

- Stability and governance;
- Access to IT, HR, procurement and financial services;
- High quality accommodation;
- Access to a wider range of stakeholders

17 However, given the self-sustainability mandate, Consumer Focus and the DH agreed that alternative structural/organisational governance options should be considered. The Government's decision about the future of Consumer Focus has given added emphasis to consider organisational structures.

Investigating other organisational structures for the NSMC

18 Following an extensive review of structural options, it was recently agreed that there were three main options which would best meet The NSMC's operational needs moving forward. These were:

- The NSMC staying within Consumer Focus as a trading arm of the organisation;
- The NSMC moving to be hosted by another organisation/government department;
- The NSMC leaving Consumer Focus to form a separate legal entity. Options included a Community Interest Company (CIC) limited by guarantee (a form of social enterprise – see Annex A for further details), a charity and a private company (limited by shares);

19 The option of staying within Consumer Focus for the longer term was not considered favourable due to the Government's plans for the organisation. Also the restrictions placed upon Consumer Focus as an NDPB, e.g. marketing and recruitment restrictions are onerous for an organisation which will have to earn income to survive.

Transfer to another NDPB or government department

20 The NSMC held discussions with the DH and other key stakeholders to determine if there was another suitable NDPB to which The NSMC could transfer. In their current circumstances the DH were not in a position to incorporate The NSMC and they were also of the view that there were no other suitable government departments to which The NSMC could or should transfer.

21 Advice was also sought from Bates Wells Braithwaite and Strategic Investment Partners (strategic business planners). It was concluded that transfer to another NDPB would offer no more flexibility than remaining within Consumer Focus, and that the opportunity-cost of doing so was unfavourable. It was agreed that The NSMC needed to move out of the government sphere to ensure it can operate in a cost-effective and operationally responsive manner.

Private Company

22 A private company limited by shares would allow The NSMC to operate with the efficiencies necessary to increase the likelihood of ongoing sustainability but would not be in synergy with The NSMC's aim of "working with organisations across government ....for social good.". Furthermore, T-sol and DH Legal Services would not be able to endorse this option as it would lead to insurmountable issues with respect to the transfer of assets, state aid and anti-competition rules.

Charitable Company Limited by Guarantee

23 This option was evaluated thoroughly with Bates Wells Braithwaite as it was seen to afford The NSMC considerable advantages including the obvious kudos and reputational benefits and the availability of tax reliefs (e.g. corporation tax and relief on premises). However, it was also noted that The NSMC would be subject to regulation by the Charity Commission and that one of the main benefits of charitable status - tax relief, would not be relevant as the NSMC is unlikely to attract donations from individual tax payer or companies.

Community Interest Company

24 Several forms of social enterprise structure were also considered, including Community Interest Company (CIC) limited by shares, co-operative and mutual. However, based on The NSMC's planned future activities and origins in government a CIC limited by guarantee was judged to the best option for The NSMC from governance, legal and operational standpoint. For these purposes, the community means the global community and therefore a CIC can be involved in international business and still comply with its purpose. This would not be the case if The NSMC were to remain part of Consumer Focus or transfer to another NDPB.

25 Notably, the transfer of The NSMC to a CIC limited by guarantee was considered to be the most suitable vehicle for The NSMC by T-SOL, DH Legal Services and Bates Wells & Braithwaite (London's leading charity and social enterprise solicitors). Social Enterprise London was also of the view that a CIC limited by guarantee would be the best legal and operational structure for The NSMC moving forward. A CIC limited by guarantee is a form of social enterprise. It is a type of company registered with Companies House that allows organisations to ensure that their assets are dedicated to public benefit purposes without applying for charitable status. The key benefits are:

- Protection of assets against distribution to members
- Ability to generate profits which can then be used for community interest projects
- Increased requirements in terms of transparency and accountability compared to other companies
- A requirement to have a clause in the constitution setting out the objects of the company
- A check at the point of registration that the objects of the organisation are in the public and community interest, with subsequent changes being subject to regulatory approval.

C Would The NSMC be viable as a CIC?

26 This is a critical question and it is now proposed that we:

- carry out a comprehensive business analysis against which the future viability of the CIC is assessed;
- develop a governance process to oversee the transition from Consumer Focus and separately the running and oversight of the CIC;
- set out a timetable against which to monitor the milestones progress towards the setting up of the new organisation.

Ultimately, if NSMC is not viable as a CIC this would be a matter for those concerned to take appropriate decisions. Consumer Focus would not be involved although clearly we will want to take all appropriate steps whilst they are part of NSMC to maximize their prospects of success.

D How will The NSMC be funded between 1 April 2011 and the date at which it becomes a CIC?

27 Following a rationalisation of staffing at the beginning of the new financial year the NSMC will have sufficient capacity through earned income, on-going projects and newly agreed projects to cover its costs from earned income (i.e. not from BIS grant) during the period 1st April 2011 until 30th September 2011, (It is expected that the NSMC will transition out of Consumer Focus during this time period). NSMC

management is currently working with Graham Clark, Finance and Operations Director to finalise funding arrangements during the transition period. This will be reported to the March board meeting as part of the budget.

Resources

28 Further work on developing a new model for the NSMC and setting up a CIC will be funded from within existing DH grant. Ongoing work in 2011/12 would be funded from income received by NSMC. A provision for any closure costs already exists in our balance sheet, set aside from the contracts with DH and other customers ie not from BIS grant. This provision is reviewed annually.

This paper has had the input of the following organisations and people:

- Treasury Solicitors Department (T-Sol)
- Department of Business, Innovation and Skills (BIS)
- Social Enterprise London (SEL)
- Consumer Focus and The NSMC staff
- Strategic Investment Partners
- London Business School
- DH Social Marketing and Legal Services
- Bates Wells Braithwaite
- Within Design LTD

As 16th March 2007

DH Department of Health

NCC National Consumer Council
Making all consumers matter

3 YEAR GRANT AGREEMENT
April 2007 – March 2010

For the on-going development of
THE NATIONAL SOCIAL MARKETING CENTRE

National Social Marketing Centre

Between

NATIONAL CONSUMER COUNCIL

and

THE DEPARTMENT OF HEALTH

(via its Health Improvement Directorate)

CONTENTS:

1: Titles and parties to the agreement
2: Status of the agreement
3: The agreement
4: Termination of the agreement
5: National Consumer Council hosting services to be provided
6: NSM Centre and annual work programme costs
7: Monitoring and operational arrangements
8: Financial arrangements
9: Resolution of problems and escalation
Annex 1: Describing the NSM centre role and audience focus
Annex 2: NSM Centre – Summary Work Programme 2007-2008
Annex 3: Strategic partnership – development and 'rules of engagement'

1: TITLES AND PARTIES TO THE AGREEMENT

3 year Agreement for the further development and hosting of the National Social Marketing Centre. Building on the previous 2 year Service Level Agreement between the Department of Health and National Consumer Council.

The parties of the AGREEMENT are the National Consumer Council and the Department of Health (via its Health Improvement Directorate)

2: STATUS OF THE AGREEMENT

This Agreement is not legally binding, nor is it a contract. It is intended to represent a clear undertaking by National Consumer Council to build on its strategic partnership with the Department of Health, to further develop the National Social Marketing Centre (NSM Centre), within the available resources, for the agreed Department of Health funding level.

3: THE AGREEMENT

This Agreement takes effect from 1st April 2007, for a period of 36 months to 31st March 2010.

4: TERMINATION OF THE AGREEMENT

The Agreement, in full or part, may be terminated at any time and by either party in the event of unsatisfactory level of service, change in circumstance or other good reason, subject to a notice period agreed between the parties at the time of termination.

In the event of early termination the National Consumer Council will be entitled to full reimbursement of any costs it has incurred in undertaking development of the NSM Centre. This would comprise, for example, where contract commitments have been issued for work to be undertaken by third parties etc, and including the costs of terminating staff contracts employed for the sole purpose of benefitting this agreement. NCC shall at all times seek to minimise such liabilities and costs.

5: NCC HOSTING SERVICES TO BE PROVIDED

Service element (and description)	Costing 2007-08	2008-09	2009-10
Infrastructure: • Office infrastructure, accommodation, building and welfare services • Office accommodation for up to 15 work-stations • Use of NCC conference, board and other meetings rooms, subject to pre-booking and availability • Use of NCC audio visual and video conferencing facilities, subject to pre-booking and availability • IT support: including equipment, networking, MS Office and database software, and unlimited email and internet access. • Access of shared office facilities (colour and mono photocopiers, printers, telephones, postage facilities, etc) • Full reception, postal and messaging system • NCC general training provision • General and liability insurance and fees			
Human Resources: • Staff support for up to 10 fte staff (including staff advertising and agency placement fees as required) • Job descriptions, recruitment, Human Resources admin, etc • Inductions • Health & Safety training			
Finance: • Financial administration • Monthly & Quarterly finance reporting • Procurement and contract support • Audit costs, etc			
NCC staff contribution: • Chief Executive and senior team contribution • Research, Policy and Communications staff input • Back-up and cover for sickness and holidays			
Total:	**£**	**£**	**£**

6: ANNUAL NSM CENTRE AND WORK PLAN COSTS

[annual total for the 2nd and 3rd years of the AGREEMENT subject to annual review in prior December, to maintain flexibility to respond to changing DH needs and requirements]

	2007-08	2008-09	2009-10
Core NSM Centre costs • Initial staffing assumption of 9.4 fte • Including costs for Director & Deputy Director, NICE secondments			
Annual SM Capacity and Skills Development work programme costs, based on five programmes approach: • Programme 1: Practitioner development, support & events • Programme 2: Interventions support, technical assistance • Programme 3 : Standards development & learning from practice • Programme 4 : Practical resources and communications • Programme 5 : Intelligence, Insight and Research			
Total:	**£**		

7: FINANCIAL ARRANGEMENTS

The National Consumer Council will submit invoices quarterly in advance (in line with its existing arrangements with its main Government funder the Dept for Trade and Industry). Department of Health undertakes to process the claim, in line with Government Departments standards, namely within twenty-eight (28) calendar days of receipt.

8: MONITORING AND OPERATIONAL ARRANGEMENTS

Quarterly review meetings will be held between Department of Health, National Consumer Council and NSM Centre representative, with reports as required to the host organisation (NCC) and the DH.

In addition there will be monthly bilateral meetings between the NSM Centre and Department of Health's Health Improvement Directorate representatives.

9: RESOLUTION OF PROBLEMS AND ESCALATION

Any issues identified relevant to the effective operation and delivery of the NSM Centre development and programme will be discussed in the first instance in the monthly bi-lateral meetings between the Department of Health's Health Improvement Directorate & the NSM Centre. If issues can not be resolved at this operational level, they will be escalated to the National Consumer Council's Chief Executive, or their appointed representatives, and Department of Health's Deputy Chief Medical Officer.

Annex 1

Describing the NSM Centre role and audience focus

NSM Centre – core purpose

The NSM Centre has been established to assist the Department of Health in delivering its national health improvement social marketing strategy, and in particular to deliver a work programme focused on building capacity and skills in social marketing.

It will do this by working with others to increase understanding and practical utilisation of strategic and operational social marketing, at national and local levels.

NSM Centre mission

To work with people on key behavioural challenges, and assist them to improve the impact and effectiveness of the behavioural interventions they undertake. To do this by working with people at the national and local levels, to increase the integration and use of effective social marketing approaches into strategic and operational commissioning and development work.

Department of Health priority audiences

While Department of Health stakeholder priorities may be adjusted and changed over time, the following are currently key priorities for their Health Improvement Directorate:

- Department of Health staff working on national strategies, programmes and campaigns (including policy, programme, communications and research) and their related stakeholders contributing to these.

- NHS staff who are involved in commissioning and developing health and well being strategies, programmes and campaigns
    - including relevant staff within: Strategic Health Authorities (SHA's), Primary Care Trusts (PCT's) other NHS trusts and organisations.

- Local Strategic Partnership (LSP), Local Area Agreement (LAA) and Regional Government Office (GOR) stakeholders and partners
    - including relevant staff within: local authorities, voluntary and community sector organisations, the private sector and public health and relevant staff in the Government Offices for the Regions.

Annex 2

NSM CENTRE – WORK PLAN *(as March 2007)*
SUMMARY OF PROGRAMMES & KEY PROJECT AREAS

NSMC Strategy and management

- NSM Centre management and development, inc: strategic partnership and governance
- Director / Deputy Director advice and governance support to Department of Health, as required

Programme 1: Practitioner development and demonstration initiatives support

1.1: NSM Associates development scheme
- NSM Associates identification, recruitment and training support // Secondments and fellowships

1.2: NSM seminar and training workshops and courses
- SM workshops (x10) & SM Masterclass' (x5) // CEO / Chairs / Members events (x10)

1.3: Local social marketing demonstration initiatives
- Core of 10 main initiatives // additional local initiatives as contracted (eg: DH Lewisham Smoking initiative)

1.4: NSM Academic Network development (inc: DH Public Health Academic Network support)

1.5: Course material and syllabi development
- Development of agreed core SM syllabi content // Production of teaching & training materials

Programme 2: Interventions technical assistance and support

2.1: DH National programme technical assistance and support
- DH-HID Health Strategy support // DH-HID Policy & Comms leads receive Benchmark Criteria & tailored briefing // Support to relevant policy and delivery programmes.

2.2: DH internal awareness raising and briefing initiative

2.3: DH health partners and support for public/private sector engagement
- Options appraisal study for future social enterprise & other organisational options for NSM Centre
- Options appraisal re Public / Private Health & Well-being Institute / Foundation
- Public/Private sector engagement support initiative

2.4: DH NGO sector engagement support – inc: National NGO Forum links

2.5: Other government department and other organisations support
[note: 2.5 is not funded from main DH Grant Agreement and agreed and contracted separately]

Programme 3: Standards development and learning from practice

3.1: NSM Standards development and national benchmark criteria roll-out
- NSM Standards Develop Group established + CIM, MSSSG & key universities
- NSM Ethics Advisory Group established with practical advise & resources
- SM National Benchmark Criteria established
- SM competencies agreed with key professional groups (integrated with USA & CANADA)

3.2: Learning from practice initiative – identifying and collating case examples
- Illustrative case examples compendium resource // database resource // Web-access resource

3.3: NSM Awards scheme – appraisal and development (for dedicated & integrated)

Programme 4: Communications, events and practical resource development

4.1: NSM stakeholder intelligence, analysis and database development

4.2: NSM e-NETWORK & e-BULLETIN development

4.3: Social Marketing resources and materials development and production
- NSMC website // NSM Planning Guide 'Scoping resource' // NSM Commissioning SM support guide // 'Training the trainers' manual // SM Presentation materials resource – online, C.C. electronic formats // SM discussion papers & articles

4.4: NSM conferences and other events
- 2nd National Annual SM conference & expert symposium (x1) // Series of National SM Forum's (x3) // Seminar & presentation events (x30) // Health Challenge England – events with DH-HID (x10) // Regional events support (x8) // Options appraisal and development work for 1st World SM Conference (2008)

Programme 5: Research, intelligence and insight (as relates to social marketing)

5.1: Field intelligence and needs assessment initiative

5.2: PCT & SHA analysis of integration of social marketing into relevant strategies

5.3: Customer / Market Research – "1-stop-shop" resource development

5.4: National programmes and campaigns learning archive

5.5: Association of Public Health Observatories engagement work inc: segmentation

5.6: Overall review and evaluation work with NSMC programmes and projects

[note: the following is a sixth programme inc: agreed funding additional to core NSM Centre Grant Agreement]

Programme 6: Health inequalities & Health Literacy

6.1: Examining and promoting use of social marketing to address health inequalities

6.2: Health Literacy – survey and index development

Annex 3

DH & NCC strategic partnership – development and 'rules of engagement' –

Contents:

1: Introduction
2: History and background context:
3: Premise for the further development of the National Social Marketing Centre
4: Describing National Consumer Council's strategic partnership relationship with the Department of Health.
5: 'Rules of engagement'
Status of the NSM Centre
Style of Interaction
Governance and Accountability
Policy and Communications
NSM Centre communications and positioning
Stakeholders
Commissioning work by the DH Health Improvement Directorate

1: Introduction:

This annex summarises the context for the 3 year AGREEMENT and how it is envisaged the strategic partnership between the Department of Health and National Consumer Council, will work in practice. It builds on the learning from the previous strategic partnership and current 2 year Service Level Agreement (2005-2007) due to end shortly.

In developing the strategic partnership it is recognised by all parties that the NCC requires security of funding and stability of approach from the Department of Health to ensure it can effectively manage and deliver work over the 3 year period. At the same time it is also recognised that the Department of Health, and specifically the Health Improvement Directorate (HID), wants to maintain flexibility to be able to respond to changes needs and requirements over time.

The strategic partnership and 3 year AGREEMENT is based on holding annual reviews in December each year to review developing priorities and ensure that the work programme for each subsequent financial year can be directly linked to the priorities and needs of the Department of Health, and particularly its Health Improvement Directorate, at that time.

The NSM Centre work plan and its inter-linked programme areas, have specifically been created to provide a robust framework that can remain stable for a 3 year period while allowing detailed project plans and component work plans to respond to specific annual priorities as discussed and agreed with the Department of Health, and specifically the Health Improvement Directorate.

2: History and background context:

The Department of Health in early 2005 established a strategic partnership with the National Consumer Council to establish a National Social Marketing Strategy team (subsequently renamed the 'National Social Marketing Centre') to undertake a 2 year independent review into social marketing and health-related behavioural interventions across Government.

The independent review was subsequently published in June 2006 as an NCC report *'It's our health!'*. It's findings confirmed the potential of social marketing to help enhance and improve behavioural interventions at national and local levels, highlighted the historical lack of investment in developing capacity and skills in social marketing across the country, and included over 50 practical recommendations for Government on ways to improve the application and utilisation of social marketing.

The Government subsequently confirmed their acceptance of the review findings and has begun to work to address and implement its key findings.

3: Premise for the further development of the National Social Marketing Centre

One of the reports recommendations was to formally establish and launch a National Social Marketing Centre to **further develop capacity and skills in social marketing at national and local levels across the NHS, local government, voluntary and private sectors**. This was subsequently done, and the Minister for Public Health, Caroline Flint, formally launched the NSM Centre on the 11th December 2006, alongside Ed Mayo, Chief Executive of the National Consumer Council.

At the recommendation of the National Consumer Council, and agreed with the Department of Health's Health Improvement Directorate, the next phases of development of the NSM Centre is being progressed on an initial 3 year Grant Agreement, to commence from April 2007.

It is the intention of the Department of Health and National Consumer Council that during this AGREEMENT the NSM Centre will undertake an assessment of organisational and funding models that might support the medium and longer term development of the NSM Centre.

While this may involve future Government funding support the intention is to examine in more detail the feasibility of developing a mixed funding base for the NSM Centre so as to assist its longer term existence. As part of the analysis and assessment options for the appropriate location and organisational form for the NSM Centre will be considered, and in particular the feasibility of becoming a social enterprise will be explored.

4: Describing the National Consumer Council's strategic partnership relationship with the Department of Health

The National Consumer Council is committed to lending its support and practical assistance to the Department of Health's mission to achieve a greater consumer-focused social marketing approach across its work, and in particular its PSA health improvement priorities, by helping improve the impact and effectiveness of its behavioural interventions, programmes and campaigns.

Key to National Consumer Council's engagement with the Department of Health on this work, is the importance of maintaining a strategic partnership approach, rather than a more simplistic and limited contractor relationship. The National Consumer Council as a national body does not seek to manage and deliver Government services, but rather to work with and alongside Government to assist them in delivering a consumer-focused approach to policy development and its implementation.

This relationship does not preclude establishing specific agreement's to use the National Consumer Council's unique role, expertise and skills, to develop and deliver specific work streams focused on specific outcomes. However this is only undertaken where there is a clear mutual advantage to the National Consumer Council and the relevant Government Department, and it is clear that the National Consumer Council can add real value to the Health Improvement agenda of the Department of Health.

Experience to date, particularly that gained in working with the Department of Health to deliver the national independent review, indicates that a critical success factor for effective strategic partnership is to ensure that all parties are clear about the desired outcomes, and can assess the delivery of work in terms of the extent to which specific outcomes are achieved. The independent review itself highlighted the importance of Government Department's improving the way that they work as 'expert commissioners' and so it is critical to the next phase of development, for the Department of Health to be specific about their own expectations and outcomes they want the strategic partnership to achieve.

The National Consumer Council is keen to continue to work with the Department of Health strategically and to plan on a medium and longer-term basis.

Key issues for the strategic partnership:

- ensuring a shared strategic approach
- building a shared understanding of a partnership model

- planning on a medium and longer-term basis (initial 3 year framework)
- minimise potential for frequent in-year changes to aims or plans
- building a flexible 'problem solving' approach that can respond rapidly to changing environments, while maintaining a consistent overall approach
- achieving a genuine 'outcomes' focused approach
- ensuring clear accountability and appropriate reporting arrangements
- building and maintaining a critical mass of flexible human resource skills and capacity
- ensuring clear arrangements and timetable for annual objective setting, review and agreement about grant allocations.

5: "Rules of Engagement"

This section sets out the terms of the working relationship between the Department of Health and the NSM Centre, based at the National Consumer Council. The main, but not exclusively contact with the Department of Health will be via the Health Improvement Directorate.

Status of the NSM Centre

The NSM Centre is a strategic partnership between Government and the National Consumer Council. Its current main source of funding is from the Department of Health via the Health Improvement Directorate. The National Consumer Council is a public body which champions the consumer and customer-focused policy and practice across Government and more widely. The National Consumer Council's main funding is received from the Department for Trade and Industry. The National Consumer Council is not therefore directly accountable to the Secretary of State for Health, nor is the Secretary of State for Health accountable for its actions as a corporate entity. This strategic partnership and bilateral relationship between the Department of Health and the National Consumer Council in relation to the NSM Centre work, is governed by this core Grant Agreement and is specifically focused on building capacity and skills in England.

Style of Interaction

The Department of Health and National Consumer Council share a common purpose in relation to social marketing and using it to increase consumer/customer-focused policy and practice at the national and local levels. The annual NSM Centre Work Plan will underpin this AGREEMENT between the parties, and will be reviewed each December so that specific plans can be revised to meet on-going and changing needs and requirements. The Department of Health and the National Consumer Council aim to continue its existing collaborative and collegiate style of engagement.

Governance and Accountability

The NSM Centre therefore has joint accountability to the Department of Health (via the Health Improvement Directorate) and to the National Consumer Council.

- Corporately within National Consumer Council the NSM Centre is accountable to the NCC Board for its performance, and conduct of its staff, and for its overall budget and expenditure and adherence to National Consumer Council governance arrangements. NCC is responsible for day to day staff management and overall delivery of this agreement.

- Within the Department of Health the NSM Centre is accountable to the Deputy Chief Medical Officer through her appointed representative. The delivery of the annual NSM Centre work programme commissioned by the Department of Health, is overseen by the Director of Public Heath in the Health Improvement Directorate, via the internal Department of Health Social Marketing Programme Board. The NSM Centre is a member of this Board and will provide regular reports to it, with routine engagement via the secretariat to the Social Marketing Board (current held with the Social Marketing Development Unit). The NSM Centre will provide quarterly reports of spend and

delivery of work programme to the secretariat, against the agreed Department of Health funded budget for NSM Centre activity. The specifics of these arrangements may vary from time to time but the principles will be maintained.

Any issues concerning the performance of the NSM Centre and its staff in delivery of the agreed Department of Health funded programme that cannot be resolved through the Social Marketing Development Unit, or the Social Marketing Board, or which are inappropriate to that Social Marketing Board will be resolved through bilateral discussions between the National Consumer Council Chief Executive, and the Deputy Chief Medical Officer or their representative.

Policy and Communications

The Department of Health and National Consumer Council recognise that the NSM Centre needs to be sensitive to wider political and ministerial issues around NHS and Department of Health health policy and in its relations with other government bodies, the devolved administrations and European Agencies. The principle of "no surprises" will be paramount and supported by the following further principles:

- The Department of Health will respect the intellectual objectivity and independent role of the National Consumer Council & NSM Centre. The default position for communications should be that the National Consumer Council & NSM Centre is independent of government and speaks with its own voice and not on behalf of the Department of Health, avoiding the use of the Department of Health brand, other than where consistent with an agreed joint branding strategy.

- Subject to the more general conventions governing the conduct of Government business, the Department of Health's Health Improvement Directorate will, as far as possible, work with the National Consumer Council & NSM Centre in a spirit of openness, informing the NSM Centre of developments material to its work and will expect the National Consumer Council & NSM Centre to respect the confidentiality and sensitivity of discussions with the Department of Health in the evolution of policy.

- While it is envisaged in enacting the strategic partnership that the National Consumer Council & NSM Centre will necessarily engage with and comment on developing policy and practice, they will nevertheless make clear in any external communications (oral or written) that they do not formally represent the Department of Health or Government, and therefore their comments will not be presented in a way that might imply they are.

- The NSM Centre to ensure that any statements it makes in relation to the agreed programme of work are consistent with Department of Health approved policy documents and statements, or where they are not, have received specific approval.

- To avoid ambiguity the National Consumer Council & NSM Centre will use or print a disclaimer making it clear that the views expressed are those of the National Consumer Council or NSM Centre and not the Department of Health, and avoid the use of the Department of Health's brand, unless part of the agreed joint branded strategy. However the National Consumer Council & NSM Centre will recognise that when it is, speaking or acting explicitly on behalf of the Department of Health, under the arrangements agreed, it must do so consistently with expressed Government policy or strategy and with prior consultation with the Department of Health, via the Health Improvement Directorate.

- Where the National Consumer Council is responding to consultation by Government on policy on areas relevant to the NSM Centre it will ensure that there is no inference that the views expressed by the National Consumer Council or NSM Centre are those of the Department of Health.

Action plan 57

Foreword by the Minister of State for Public Health

In today's fast-moving, information-hungry society, people want and expect convenience, choice and personalised advice in all areas of their lives. People want their health, education and social services to help them to lead healthy lives. These services need to deliver world-class care and treatment, early intervention when problems arise, and protection from health threats.

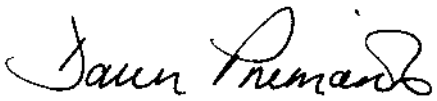
This strategic framework sets out how we plan to make sure that our policy development and all of our public health interventions are informed by our understanding of what motivates people. This will mean that we can build on our successes and ensure that we become a world leader in promoting health.

People's choices – and how they lead their lives – play a crucial part in how healthy they are. The good news is that most people are now wealthier, healthier, better educated and living longer, and they expect to remain active for longer.

Such changes represent a huge step forward, but there are still too many people across the country who do not enjoy the good health experienced by the majority and these health inequalities are unacceptable. In some areas (and among some groups) the health gap between the better off and less well-off is not closing. Huge health challenges are posed by issues like obesity, drug and alcohol misuse, smoking, sexual health and teenage pregnancy, and poor mental health. Our task is to ensure that we use the evidence and our understanding about people to design and deliver interventions that help as many individuals as possible.

Tackling today's threats to health means examining how we live. We must be sensitive to people's needs and work with them to make the changes that they can and want to make. People's behaviour is influenced by a wide range of factors – some of which they have control over, and some of which they don't.

Future interventions will help people to manage their own health challenges, and to enjoy the rewards of better health. We will listen to what people say when developing these interventions, and will put more effort into providing them with direct practical support. We will also make it easier for partners from the private and third sectors (such as non-governmental organisations (NGOs) and



voluntary organisations) to make a greater contribution to working with us.

We will make it as easy as possible for more people to adopt healthier behaviour and, where appropriate, we will focus on small but realistic and achievable steps towards healthier lives. People need to feel that they can start to make a difference and that better health is something they can aspire to achieve.

We will take a 'whole person' approach: rather than running multiple separate campaigns, for example, we want to join up support and advice about sexual health, alcohol misuse and safety. This strategic framework sets out how we will test out where and when this approach is appropriate – and how it can work in practice.

By working with a broad range of partners, our efforts to make England healthier will gain momentum, and we will be able to build a nationwide social movement for health.

Social marketing is not just the latest fad – it underpins our efforts to ensure that the consumer is always at the heart of policy-making and service delivery. This framework illustrates our long-term commitment to a new way of working and to adopting a systematic approach to the promotion of public health. It will ensure we have a meaningful impact on reducing health inequalities and reducing the burden of lifestyle diseases on society. I commend it to everyone leading and delivering health-related behavioural interventions across the commercial and public sectors, as well as to those whose activities have an impact – either positive or negative – on people's health.

Dawn Primarolo
Minister of State for Public Health

The social marketing strategic framework

Health Challenge England – Next Steps for Choosing Health **(a progress report published by DH in October 2006) set out seven key principles that will guide our approach to improving health and that have fed into this new strategic framework:**

Providing strong leadership across government and joining up policy development

Developing a stronger focus on understanding people

Forging new partnerships with industry, the voluntary sector and communities

Personalising support

Providing protection where needed

Focusing on key priorities for delivery and quantifying the benefits of change

Ensuring that system reform is aligned to improve health and tackle health inequalities

We commissioned a series of regional roadshows to give key stakeholders an opportunity to discuss how to deliver these seven principles. Workshops were held for between 50 and 80 key decision makers from strategic health authorities (SHAs), primary care trusts (PCTs), local businesses, local authorities, academies and the third sector (e.g. voluntary groups). Their feedback (particularly on partnership working) has been fed into this new strategic framework.

Responding to the health challenge

Choosing Health led to *It's Our Health!* (an independent review published by the National Consumer Council (NCC) in June 2006), which set out the Government's commitment to social marketing and examined the potential of social marketing to help improve the impact of health promotion interventions. For more information about social marketing, take a look at the accompanying booklet *What is social marketing?*.

It's Our Health! confirmed there was growing evidence that social marketing can help more people to lead healthier lives. It also highlighted gaps in capacity and skills in social marketing; provided a range of practical recommendations on how the Government could build capacity, integrating social marketing into policy and practice; and illustrated where good practice could be built into future learning.

This new strategic framework constitutes the Government's response to *It's Our Health!*, and sets out how we will use social marketing and other behavioural change activities to put the consumer at the heart of health improvement and delivery.

This framework is also closely aligned to the recommendations arising from *Our Health, Our Care, Our Say: A new direction for community services* (the White Paper published by DH in January 2006), which recommended a radical and sustained shift in how services are delivered. The emphasis was on ensuring that services are more personalised and that they fit into people's busy lives. The White Paper underlined the need to give people a stronger voice so that they become the major drivers of service improvement.

This framework provides us with an opportunity to update readers on where we are with our social marketing work, and to set out our programme of actions to embed social marketing approaches in public health.

Counting the cost

Securing Good Health for the Whole Population (written by Sir Derek Wanless and published by HM Treasury in February 2004) set out a challenge to move towards a 'fully engaged scenario' in which most people were taking active steps to improve their own health. The document made it clear that increases in NHS funding would be cancelled out by increasing numbers of people with chronic diseases and largely preventable ill health unless we can reach this position. The potential cost of inaction was said in the review to run to a staggering £187 billion.

A new social movement for health

DH (or even the whole of government) cannot change people's behaviour without the support of individuals themselves, or active help from the commercial and third sectors. But the Government can encourage, enable and create the conditions to build a social movement for health.

Social movements for health have existed in the past and spring from a widely held perception that something is wrong and that something must be done.

Social movements take off when issues are serious and touch everyone's lives: we now face such a situation in this country.

Although we are a comparatively healthy country in relation to many European nations, we face a continued challenge in terms of obesity, drug and alcohol misuse, smoking, sexual health and teenage pregnancy, and poor mental health. But we will work to create a network of health champions who can ensure that we put in place consumer-focused measures to prevent ill health over the long term.

What people think about their health

While the Government does have a role to play in improving the health of the nation, it cannot achieve this in isolation and does not have all the answers. We can help to set the scene for improved health, and can support community efforts – but people are ultimately responsible for improvements to their health. And many of them acknowledge this.

It is evident from the surveys that people are ambitious for their own health and for the health of their family. We share those ambitions for health.

89% of people agree that individuals are responsible for their own health (King's Fund, 2004)

93% of parents agree that they are more responsible than anyone else for their children's health (King's Fund, 2004)

83% of people want to take more responsibility for maintaining their own health (BUPA and TNS, 2005)

89% of people claim that healthy eating is important to them (*Consumer Attitudes to Food Standards*, published by the Food Standards Agency in February 2007)

88% of people believe that parents should be strict with children and make them eat healthily (*Consumer Attitudes to Food Standards*, published by the Food Standards Agency in February 2007)

79% of people say that parents themselves have a great deal of responsibility for the current problems with children's diets (Ofcom and GfK NOP, 2005)

What people think about the Government's role in improving health

33% of people believe that the Government has an important role to play in promoting health (Ofcom and NOP, 2005)

86% of people say that the Government should intervene to prevent illness by providing information and advice (King's Fund, 2004)

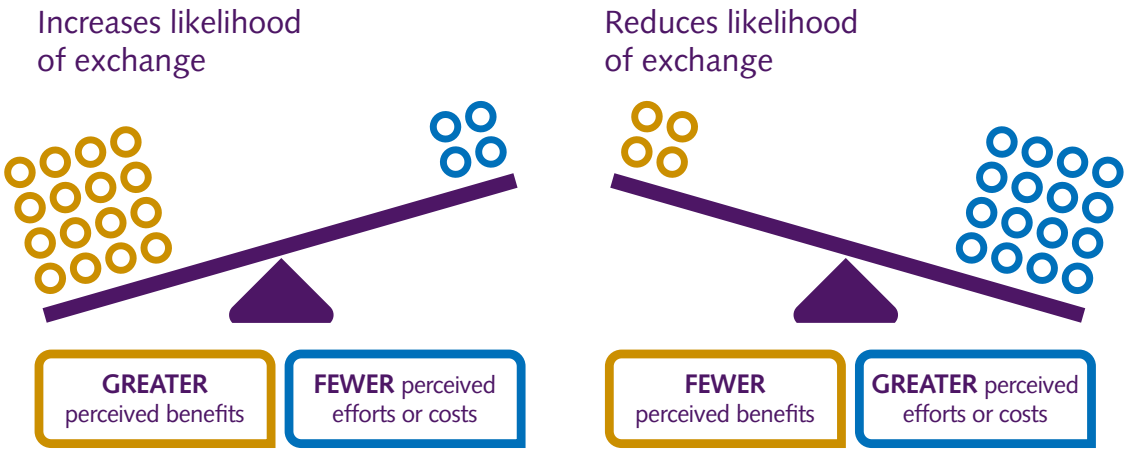
37% of people do not trust government advice and 20% completely ignore it (GfK NOP, 2005)

33% of people believe that the Government has an important role to play in promoting health (Ofcom and NOP, 2005)

Introducing the framework

This strategic framework is part of a long-term programme of action at the national, regional and local level designed to improve health and reduce health inequalities. This new strategic direction also forms part of the Government's 'Engage' strategy, which is designed to put people and their needs at the centre of all policy development and related service delivery.

The primary aim of social marketing is to achieve a particular social good (such as reducing childhood obesity) rather than a commercial benefit. It is a systematic process that uses a range of marketing concepts and techniques to address short-, medium- and long-term issues with clearly identified and targeted behavioural goals.



Social marketing concepts

The following six features and concepts underpin social marketing:

- **Consumer orientation:** gaining deep insight and understanding about the consumer, their knowledge, attitudes and beliefs, and the social context in which they live and work.
- **Behaviour and behavioural goals:** understanding existing behaviour and key influences on it in order to enable the development of clear behavioural goals. These goals should be divided into actionable and measurable steps or stages, phased over time.
- **'Intervention mix' and 'marketing mix':** using a range of different interventions or methods to achieve a particular behavioural goal. When used at the strategic level, this is commonly referred to as the 'intervention mix': when used operationally it is described as the 'marketing mix' or 'social marketing mix'.
- **Audience segmentation:** making use of audience segmentation in order to target effectively.
- **'Exchange':** using and applying the exchange concept (what people must give up or pay in order to receive the benefit). Understanding the real cost to the customer will enable a more effective exchange, whereby the potential benefit can be optimised and the 'cost' to the customer minimised.
- **'Competition':** understanding all the factors that compete for people's attention and willingness to adopt a desired behaviour (e.g. the influence of other people or organisations, or the internal drivers of pleasure, habit or addiction).

Figure 1: The 'Exchange' concept

Listening is the bedrock

Social marketing is not a panacea. It is rooted in a deep understanding of what people think and how they act, and can be a powerful tool for bringing about behavioural change. While many of our health promotion efforts have already drawn on some marketing approaches, the systematic application of social marketing is still relatively new in England.

In order to encourage people to change their behaviour, we need more of an insight into what moves and motivates them, and into what will help them to make changes. We will build on our strong epidemiological and demographic information systems to develop our understanding of why people behave in ways that lead to poor health outcomes, and of what will help people to adopt positive health behaviours.

Engaging everyone in promoting health

The 2012 Olympic Games – together with the public's increasing desire for healthier lifestyles, and better health products and services – offer tremendous opportunities to promote healthy behaviours. We will encourage everyone to make changes to improve their own and their family's health.

By establishing meaningful partnerships, we will also make it easier for private sector companies, social enterprises and charities to play their part. We will support local communities, local government and the NHS to put more emphasis on prevention and positive health promotion.

We will develop a comprehensive system to track and evaluate all of our future health promotion programmes, and will put in place systems to record any new information gleaned. This can then be shared widely so that we can continue to develop insight into our knowledge of our target audiences.

A global first

The Government's approach to the strategic integration of social marketing has already won national and international recognition. While this work is still at a relatively early stage in the UK, there are indications that it is already beginning to improve the effectiveness of a range of national and local interventions.

This framework sets out how we will use our understanding of what motivates people to inform our policy development, and all of our public health interventions, in order to build on our successes and ensure that we become a world leader in promoting health.

> To talk about integrating social marketing into policy development is one thing, but in the UK you've actually started to do it. To see both the Department of Health and the Department for Environment, Food and Rural Affairs in England leading the debate is marvellous. It offers hope that we will see real impacts on some of the most significant behavioural challenges we face.

Professor Ed Maibach, Director of the Center of Excellence in Climate Change Communication Research, George Mason University, Virginia, USA

Strategic framework programmes

This strategic framework sets out how DH will embed social marketing approaches in health improvement programmes and policy development.

Based on consumer insight, our aim is to embed social marketing principles in all health improvement interventions. This will:

- empower people to build healthy lives for themselves and their families;
- ensure that those individuals who are currently in good health continue to maintain their healthy behaviours; and
- encourage change in those whose behaviour is harmful to their health.

We have put in place four programmes of action to achieve our aim:

Health capacity: the goal of this programme will be to work with public health professionals (such as those working in the NHS, at DH, in local authorities and in other public sector settings) to increase their skills, knowledge and competency in applying social marketing principles to health interventions. The programme will principally be delivered via the National Social Marketing Centre (NSMC) and will include a series of conferences and seminars, a range of resource materials, and work with the academic sector.

Health insight: the goal of this programme will be to use public health consumer insight to inform local and national health improvement activities. Our Healthy Foundations Life-Stage segmentation model is an innovative piece of work that provides a three-dimensional analysis of people's behaviour. It should enable us to develop better targeted interventions to address those who are most at risk of adopting unhealthy behaviours. It will be supported by a set of practical tools and products.

Health innovations: the goal of this programme will be to put social marketing principles into action in local, regional and national settings and to create a central resource for sharing knowledge on effective behavioural interventions across local, regional and national settings. To explore how the segmentation model can be applied in practice, we will commission a number of new behavioural interventions to explore the links between high-risk behaviours, and to look at how to reduce their impact on health inequalities. This will build on pioneering working already under way in the North East, Yorkshire and the Humber, the North West and London.

Health partnerships: the goal of this programme will be to establish effective local and national partnerships with the private and third sectors to promote good health. This will include allocating £1 million per annum in funding, which will be made available to support delivery on the ground. We will ensure that health interventions are fully integrated nationally and locally.

Health capacity

Goal: the goal of this programme will be to work with public health professionals (such as those working in the NHS, at DH, in local authorities and in other public sector settings) to increase their skills, knowledge and competency in applying social marketing principles to health interventions.

Our aim is to equip people in the NHS, local authority and other public sectors with the skills and knowledge to use social marketing in everyday work, and to embed social marketing in to people's consciousness. To achieve this we recognise that we must provide the necessary programme of support and training.

The National Social Marketing Centre (NSMC) is a strategic partnership between the Department of Health and the National Consumer Council. This partnership is based on a three-year Grant Agreement from April 2007 to March 2010.

The NSMC was established to assist the Department of Health to deliver its national health improvement social marketing strategy and to deliver a work programme focused on building capacity and skills in social marketing.

Its priority audiences include:

- Department of Health staff working on national strategies, programmes and campaigns (including policy, programme, communications and research).
- NHS staff involved in commissioning and developing health and well-being strategies, programmes and campaigns, including relevant staff within Strategic Health Authorities (SHAs) and Primary Care Trusts (PCTs).

The key aims of the NSMC are to:

- support those leading and developing national and local health improvement programmes;
- capture learning and spread good practice; and
- provide hands-on support for local delivery using social marketing principles.

Training and support

The NSMC's priority is support and training for staff in PCTs, SHAs, local authorities and the third sector, but they will also develop 'masterclasses' for chief executives, directors and non-executive directors in PCTs and NHS trusts. The NSMC also works with professional marketing bodies and training institutions to ensure that social marketing is incorporated into both undergraduate and postgraduate coursework material.

The Department of Health is working, via the NSMC at the National Consumer Council, to establish a network of regional support and development managers based in each of England's public health regions. This infrastructure will support the implementation and adoption of social marketing as a tool for effective public health behaviour change at a local level.

Workshops, conferences and forums

Since April 2007, the NSMC has provided training for over 5,000 public health professionals. Its 28 one-day 'What is social marketing?' workshops, aimed at PCT staff, covered the principles of social marketing and gave attendees the opportunity to start putting together a social marketing plan that would be relevant to their current work.

The NSMC has presented at more than 60 conferences and events across the country, including the Faculty of Public Health Annual Conference, the UK Public Health Association Conference, the Cheshire Smoke-free Conference and the World Health

Organization Rennes Healthy Cities Conference.

Following the completion of national obesity insight research, the NSMC is in the process of developing resources and workshops for the Obesity National Support Team. We have produced a short guide for managers to help them to understand how the national insight work can be applied or adapted to guide the development and commissioning of local social marketing interventions to reduce childhood obesity. A practical step-by-step guide to developing and implementing a social marketing intervention is also being developed for field practitioners.

These resources are all part of a training programme that includes a series of regional seminars and training workshops (which began in April 2008). The programme will show practitioners how to combine marketing know-how with a systematic approach to planning, managing and commissioning effective interventions.

The centre also runs Advanced Practitioner Development workshops for those who have 'social marketing' in their job title or job description (the first was held in December 2007).

In collaboration with trainers from the Tobacco Control National Support Team (TCNST), the NSMC recently delivered a one-day workshop for TCNST staff. The sessions covered case examples and exercises related to smoking. Another seven were run for different regions across the country between October 2007 and January 2008. In addition, a one-day 'Train the Trainer' course for delivery managers of the TCNST was held in September 2007.

> Public health thinks it understands what makes people tick, but clearly we don't. We need to develop the workforce to have greater understanding of the concept of social marketing – with limited resources, we need to make our spending count. Looking into social marketing, we quickly realised that there were practical things that we could learn that could really improve what we do.

Dr Diana Forrest,
Director of Public Health
Knowsley PCT

In September 2006 the NSMC managed the inaugural National Social Marketing Conference, which was attended by DH staff and staff from PCTs. Delegates were asked what help they wanted to enable them to apply social marketing principles to their everyday work, and their views have informed the current programme.

A second conference followed in 2007, which was attended by 242 delegates drawn from a wide range of professional disciplines – from professional marketers through to public health consultants. A symposium of international experts was held immediately afterwards to discuss the future of social marketing. Plans are under way for the first ever international conference, the World Social Marketing Conference, in Brighton in autumn 2008.

Every year the NSMC runs three knowledge-sharing forums to share international best practice; speakers from the UK and abroad discuss a variety of social marketing topics.

Tools and resources

In autumn 2008 the NSMC plans to publish a range of practical resources and tools for national and local practitioners and commissioners to use when applying social marketing principles. These include a social marketing planning guide, a compendium of case studies.

In addition, the NSMC publishes a quarterly e-bulletin. It is currently distributed quarterly to over 2,000 subscribers, but this number is increasing each month.

Towards the end of 2008 the NSMC plans to establish a national learning archive, which will act as a central repository of consumer insight research generated by government programmes and the academic, commercial and NGO sectors. We will encourage local community groups to contribute to the archive, and will make available examples of good practice, lessons learned, campaign material, tools and guides. The archive will enable people to search for material relating to specific geographical areas or topics.

Building an evidence base

The NSMC is committed to developing a robust evidence base for social marketing, and has set up ten learning demonstration sites, based in local PCTs and local authorities. A NSMC associate supports each learning demonstration site, and each site follows the systematic process which is key to good social marketing practice. In-depth training on the social marketing process and marketing techniques is provided for all PCT/LA staff involved in the learning demonstration sites.

As part of the initiative, the NSMC has provided guidance to ensure that clear behavioural goals are set at the start, that any relevant stakeholders have been engaged, and that there is a genuine understanding of the target audience.

All PCT/LA staff involved in the learning demonstration sites have access to a

dedicated area on the NSMC website where they can share reports, download resources, and discuss issues. Communication between the sites is supported by a monthly newsletter that lists any recent developments, new resources and upcoming events.

For eight of the sites, the scoping work, pre-testing and intervention development and refinement was completed in spring 2008. The actual interventions are ready to be piloted during summer/autumn 2008. The NSMC is commissioning an independent institution to do a through outcome (including a cost-effectiveness analysis) and process evaluation.

Academic work

Integrating social marketing into the academic sector will help build long-term capacity and capability. In March 2007, the NSMC established a National Academic Advisory Group to help build social marketing knowledge and skills in the UK academic sector, and to enhance its teaching, training and research capacity.

The Group will also encourage knowledge sharing by putting academics from the business, social and medical disciplines in touch with each other. More ideas will be generated, and joint research bids will be developed between academic centres.

Systematic planning, implementation and learning

As part of the 'Health capacity' programme, the NSMC will develop clear planning standards and budget allocation procedures. No new national programmes will be launched without first having gone through a thorough scoping phase and programme development phase. All new programmes will be required to produce a scoping report, development plan and evaluation report that will be available in the public domain (via the National Learning Archive). These will inform national and international learning about what works and what does not, and decisions to invest in new national programmes will be based on their findings and recommendations.

Local practitioners will be encouraged to adopt similar rigorous processes for programme development and learning.

Celebrating success

The 'Health capacity' programme will emphasise celebrating success by introducing a national system of awards to recognise contributions from commercial organisations, the third sector and social enterprises. We will also recognise contributions by community groups, the NHS, local government and individuals.

Listening not lecturing: How North Tyneside PCT is tackling the public use of alcohol by young people

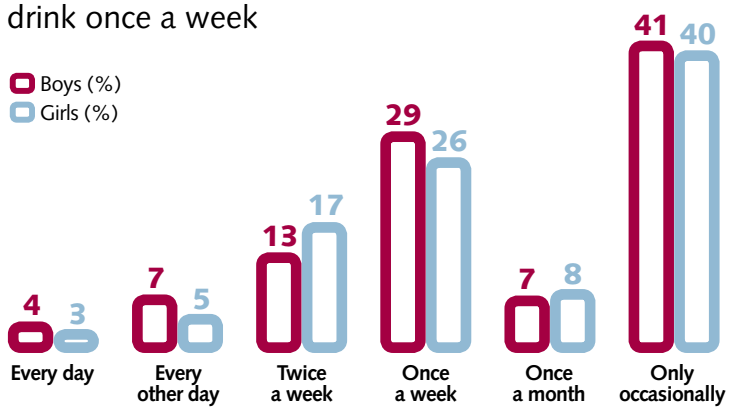
In 2007 North Tyneside PCT began laying the foundations for an initiative aimed at decreasing kerbside drinking among young people in the area. The initiative followed a process that adheres to the principles of social marketing.

"We knew we wanted to use the social marketing approach, because it puts the consumer right at the centre of the issue," says Jan Southern, a Public Health Specialist with the PCT. "Social marketing also helps to counter the common tendency to reach for a solution too early in the process."

Existing data

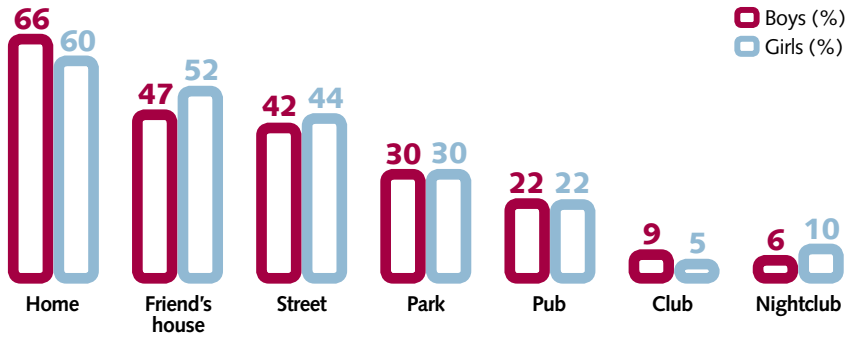
An initial review of the data pointed to several possible reasons for young people's continued presence in public spaces:

- a lack of private space of their own;
- a desire for spatial autonomy from adults;
- family breakdown;
- a lack of leisure opportunities; and
- unemployment.



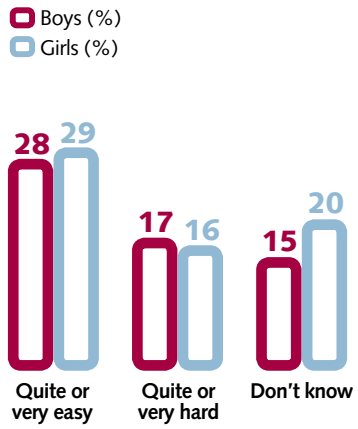
There was little evidence that school-based, or large-scale education or promotional campaigns had any effect on young people when used as the main means of countering alcohol misuse. Drinking was seen by many to be their main or only leisure option, and was also considered to be a safe alternative to drugs. On the downside, however, the concerns of young drinkers included crime and anti-social behaviour, fights, involvement with the police, vulnerability and the danger of unprotected sex.

On the advice of the alcohol steering group, the PCT carried out an initial audience segmentation (by geographic, demographic or psychographic, and behavioural factors).

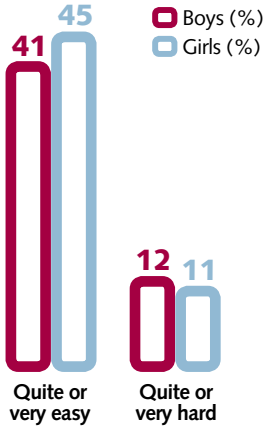


"We needed to determine the main geographical focus, age band and gender [of the problem group]," Jan explains. "We already knew that more girls than boys drank alcohol locally; that the majority drank at home, at a friend's house or in the street; that alcohol was obtained from corner shops and parents; and that young people were receiving inaccurate messages regarding the consequences of drinking alcohol. There was a general perception that young people are able to access alcohol quite freely, particularly in designated 'neighbourhood renewal areas'. We reached the initial conclusion that girls aged 11 to 15 might be our key priority."

Figure 2: Background and problem description



A large proportion of underage teens drink once a week



Many of them drink unsupervised on streets rather than indoors

How easy or hard it is for young people to buy alcohol

How easy or hard it is for young people to get others to buy their alcohol

Gaining insight

To gain the insight crucial to any social marketing exercise, focus groups were set up with young people, their parents and key workers. There were also one-to-one interviews with parents and local authority staff.

"Rather than inventing something brand new, we decided to use existing services and structures to gain access to the young people and their parents," says Jan. "The police operated a service that returned young drinkers to their homes, and we were able to tap into that. Importantly, we also worked with the local youth offending team and a local youth service called The Base, which is run by Barnardo's. All of this meant we got much better access to the young people and their families than we would have done had we tried to do it alone.

Figure 3: Analysis framework 2 – alcohol use

The consequences of drinking for young people and their families were felt across a number of domains:

Nearly all of the young respondents reported having had some contact with the police while drinking in public places:

"What we found was not surprising or new, but it was very focused. The young people spoke of their need for a space of their own where they would be respected for who they were. In the absence of such a space, they felt they had no option but to be outside. When they tried to be creative with the available space, this was often removed – leaving them with the issue of finding new space or rebuilding what they had previously.

"Hearing this message put so powerfully was an important lesson for the team, and one that we might not have heard so clearly had we not taken the trouble to talk to our audience directly."

The focus groups pointed to the exchange that needed to take place for the audience to make the desired behavioural change. In return for a place to go, with safety and activities, they would reduce their drinking in public. "But they were going to need to own and deliver the exchange themselves," says Jan. "We could set it up, and facilitate and empower the young people, but beyond that they had to be in control of the solution, with their rules, or it would fail."

Going forward

The PCT team concluded at an early stage that a multi-faceted, cross-sector approach involving the local authority, parents and the young people themselves was most likely to be effective, and this is the course that is being followed as they go forward with the project.

"The intervention mix has yet to be arrived at," says Jan. "But by taking the approach we have, I believe we have more chance of effecting behavioural change than if we had simply adopted the old-style, top-down messaging of the past. Putting the customer at the heart of the process has undoubtedly yielded dividends – even at this early stage."

Key milestones

The following are the key milestones for the 'Health capacity' programme:

- Spring 2008: publish social marketing ethics guidelines.
- Autumn 2008: first World Social Marketing Conference takes place.
- Autumn 2008: publish social marketing planning guide and compendium of case studies.
- Ongoing: implement capacity, training and skills programme for those working in public health.

Health insight

Goal: the goal of this programme will be to use public health consumer insight to inform local and national health improvement activities.

> Developing a real understanding of what citizens and businesses want from the public sector creates the opportunity to provide services through channels that will best respond to their needs.

Service Transformation: A better service for citizens and businesses, a better deal for the taxpayer (by Sir David Varney, published in December 2006)

> The drive to improve our understanding of the needs and wants of our audiences is what makes social marketing stand out from other health promotion programmes. DH's work to use this enhanced customer understanding to inform policy at the national government level is truly groundbreaking.
>
> Ian Potter, Health Sponsorship Council, New Zealand

People's motivations and decisions about how to live their lives are rarely driven by single issues, but rather by a complex range of overlapping behaviours and life circumstances. One of the key principles of social marketing is to develop programmes that are based on a deep insight into people's behaviour (this includes their motivations for change, their environment, their social network, their peers and their life experience). These programmes can then be used to shape interventions on both a local and a national level.

Employing such insight will result in a more holistic way of helping people to change their unhealthy behaviour or to maintain healthy behaviour – rather than always taking a disease- or issues-based approach.

Insight is a revelation about what compels people to act, think or feel the way that they do. Policies, campaigns or communications that are based on or shaped by insight are much more likely to ring true with audiences and to deliver the desired results.

Insight is built from demographic, behavioural and epidemiological data. It applies prior evidence and intelligence about what has worked elsewhere, together with data about what motivates people, what they say will help them and any perceived barriers.

There is rarely a 'one-size-fits-all' solution that will work across the population. Our future health promotion programmes will be built on shared insight into audiences, clearly defined through segmentation analysis, to bring about specific behaviour.

Smoking cessation in pregnancy: what Newcastle University is doing about it

With the assistance of the North East Strategic Health Authority, the School of Dental Sciences at Newcastle University recently undertook a project to reduce the number of women smoking during pregnancy.

The negative impact of smoking in pregnancy is well documented and includes a higher rate of miscarriage, pre-natal mortality, low birth weight and sudden infant death syndrome (to name but a few). About 30 per cent of women in the UK who smoke continue to smoke during pregnancy. The *Smoking Kills White Paper* (published by DH in 1998) set a target to reduce the percentage of women who smoke during pregnancy from 23 per cent to 18 per cent by 2005, and 15 per cent by 2010.

Methodologies used

- **Defining the target audience:** smoking during pregnancy seemed to be less prevalent among women from ABC1 backgrounds than among those from C2DE backgrounds (women from deprived areas).
- **Market research/generating 'insight':** extensive market research was conducted with the target population. The research adopted a qualitative focus group method, and subjects were recruited to take part in one of 12 focus groups on a door-to-door basis by trained and experienced market research interviewers. A total of 12 groups were segmented by age, social class, smoking behaviour/history and cohabitation status.
- **Pre-testing:** the posters and leaflets were pre-tested with participants from the focus groups.
- **Engaging stakeholders:** extensive developmental work was undertaken with the Institute for Social Marketing at the University of Stirling, with the University of Strathclyde and with the North East SHA.

Findings

- **Health professionals:** a major barrier to overcome was the lack of enthusiasm and empathy among healthcare professionals towards their key customers.
- **Information needs:** women already knew about the potential harmful effects of smoking during pregnancy, so the material focused instead on strategies for giving up (how to deal with cravings, how to cope with anxiety about weight gain, etc). Posters were not designed to scare the mother-to-be.

Outcomes and learning

The number of pregnant (and non-pregnant) smokers recruited to the new smoking cessation intervention increased tenfold during the intervention phase. The number of pregnant smokers recruited also increased following the role-play sessions (especially those that were held with midwives), and was higher than that of neighbouring services (in which different interventions were being undertaken).

Professional actors were used for role-play work with staff: by participating in this way, staff were given a sense of how it might feel to be one of the target women, and of what approaches might work more effectively.

The following products were developed to support health professionals and services:

- A magazine
- Leaflets
- Posters
- Training for health professionals

Insight and understanding

Our knowledge of the way people live their lives and of what can help them to make healthy choices will be at the heart of all of our 'Health insight' programmes. We will ensure that all programmes go through a thorough scoping and development phase that draws on the available data and evidence, and all programmes will pre-test interventions before they are scaled up nationally.

We will produce scoping reviews for all future programmes, as well as data on interventions and evaluations (as part of the national learning archive). This will help those working to improve health outcomes to build their knowledge of what works and what does not.

Customer-focused organisations embrace insight to guide not only their product and service decisions but their basic strategy and organisational structure as well...

Harvard Business Review,
April 2006

Humour drives home health behaviour change: Knowsley's PITSTOP initiative helps men to get their health checked out

Knowsley PCT and Knowsley Council employed insight effectively when raising awareness of health among local men aged 50 to 65 by encouraging and supporting positive behavioural change.

The approach

First, desk research revealed some key insights: men don't like talking about their health, they are reluctant to go to a doctor and late diagnosis can be a factor in early death. The team then held focus groups, which revealed that any health campaign for this group must be hard-hitting, humorous and non-judgemental, and that NHS and local authority branding needed to be very subtle.

A programme of health checks called PITSTOP was set up in 'non-health' venues (including pubs, social clubs, community centres and workplaces) and publicised with a motoring-inspired publicity campaign. Spoof road signs carried the message 'Endangered species – it's never too late to get healthier' and 'Don't ignore the warning signs – get a free health check', and there was further ambient publicity in the form of beer mats, washroom posters, stickers, pens, stress toys and car air fresheners.

In addition, a comedy play toured local venues, an ex-Everton FC player fronted PR activity and a 'Knowsley Man Maintenance Manual' was created in partnership with the Men's Health Forum.

Outcomes and learning

Over 3,000 local men had health checks, with 85 per cent of them reporting lifestyle changes some weeks later.

Awareness of men's health campaigns was shown to have increased overall.

Major long-term social marketing-driven programmes in adult stop smoking services, cardio-vascular disease prevention services and a range of other public health and corporate business areas are now under way as a result of the success of PITSTOP.

> Insight is a deep truth about the citizen – based on their behaviour, experience, beliefs, needs or desires – that is relevant to the task or issue and rings bells with the target audience.
>
> Government Communication Network 'Engage' programme

Sharing intelligence

A great deal of potentially useful data already exists, but at the moment it is not accessible in one place. Practitioners and public health champions are faced with digesting multiple streams of information and evidence before they can take any action on an issue.

PCTs, health authorities, NHS trusts, DH and other government departments all commission a considerable quantity of market research each year, and much of it could be helpful to those developing interventions or delivering services.

It is vital that any insights gained are shared widely: in winter 2008 the NSMC plans to establish an online 'one-stop market research shop' for the findings of DH- and NHS-commissioned market research. This will ensure that research is not unnecessarily duplicated, and ensure that a wider audience has access to previously unpublished DH research.

Health insight and planning service

We plan to set up a new customer insight and behaviour planning service to improve public health programme and policy planning. Specialists will provide internal consultancy services to policy leads – particularly in terms of marketing planning – to ensure that social marketing principles inform policy, and that customer insight is placed at the heart of policy making. The new service will produce a series of tracking surveys for health knowledge, attitudes and behaviour.

Details of the new service model (and any associated learning) will be published in spring 2009, and the structure will then be offered for use at both the regional and local level.

NB: The 'one-stop shop' will be password protected and open to all NHS public health professionals working to improve public health

Patients contribute to service design: How sexual health clinics in Gateshead have become more accessible to hard-to-reach groups

Gateshead PCT wanted to investigate how the overall design of sexual health services could be made more accessible to hard-to-reach groups. It planned to create a genito-urinary medicine (GUM) service with a clear treatment path that was suitable for users. The aim was that patients would be seen within 48 hours of first contact.

The approach

Better prevention, Better services, Better sexual health: The National strategy for sexual health and HIV (published by DH in July 2001) revealed that users often find GUM services disjointed and stigmatising. As part of this project, the Gateshead team worked with designers and held extensive interviews and community discussions with local people about this issue.

The focus was on young people, gay and bisexual men, Asian women and others who do not traditionally use health services. A range of design solutions were made available for comment and reaction, and subjects for discussion included:

- the design of waiting areas;
- how GUM services are promoted to the public; and
- how users and consultants interact in GUM services.

Outcomes and learning

The consultation process yielded several groundbreaking ideas for service design. These included:

- the use of cards to help people to find the right words to describe their symptoms; and
- multiple waiting areas to give patients a sense of moving forward through the system.

Gateshead PCT is currently coming to the end of the planning stages for its revised GUM service.

Healthy foundations life stage segmentation model

The use of segmentation itself is not new, but in 2006 we carried out an intensive exercise across three overarching 'dimensions' (we consulted key policy makers, health professionals and academics in order to identify these):

- age or life stage;
- people's circumstances or environments; and
- their beliefs about and attitudes towards health and health issues.

The healthy foundations life stage segmentation model provided a sophisticated '360-degree picture' of the population in terms of individual behaviour across issues including obesity, drug and alcohol misuse, smoking, sexual health and poor mental health.

A project team (incorporating representatives from DH's public health, social marketing, mental health policy and communications teams) worked with the NSMC, and academic, public and private sector marketing experts to develop the model. More information about it is contained in the attached supplement, *Healthy Foundations: A segmentation model*.

Age or life stage

The suggested life stage model below reflects the (at times complex) journey that people take through life. For example, it is possible for people to move between the 'settler', 'juggler' and 'alone again' stages as they experience different life events.

People's circumstances or environments

Published epidemiology data and work in health inequalities demonstrates a correlation between poor circumstances and multiple health issues. Research indicates that environmental factors have a critical influence on 'at risk' health behaviour, and also on people's ability to change their lifestyle to benefit their health.

Environmental factors can be categorised into three groups.

- **Social:** whether someone is surrounded by positive or negative social norms.
- **Physical:** if someone lives in a deprived community, this affects the quality of the local facilities.
- **Economic:** people who survive for long periods of time on low incomes and/or who are long-term unemployed tend to be more likely to suffer from poor health.

Those suffering in all three of these areas are the most at risk and the least able to make positive changes in their lives.

Figure 4: Suggested life-stage model

Beliefs about and attitudes towards health and health issues

Life stage and circumstances are not the only determinants of unhealthy behaviours. There are many examples of people at a certain life stage who live in poor circumstances and yet actively look after their health, and people at the same life stage who live in positive circumstances can suffer from multiple health issues. Clearly, people's beliefs and attitudes about their health influence their health status.

Combining the three dimensions

The three dimensions work together to determine people's ability to live healthily and their likelihood of doing so.

Motivation and environment determine people's approach to health, and this can then be mapped against their life stage to develop a more fully rounded understanding of behaviour.

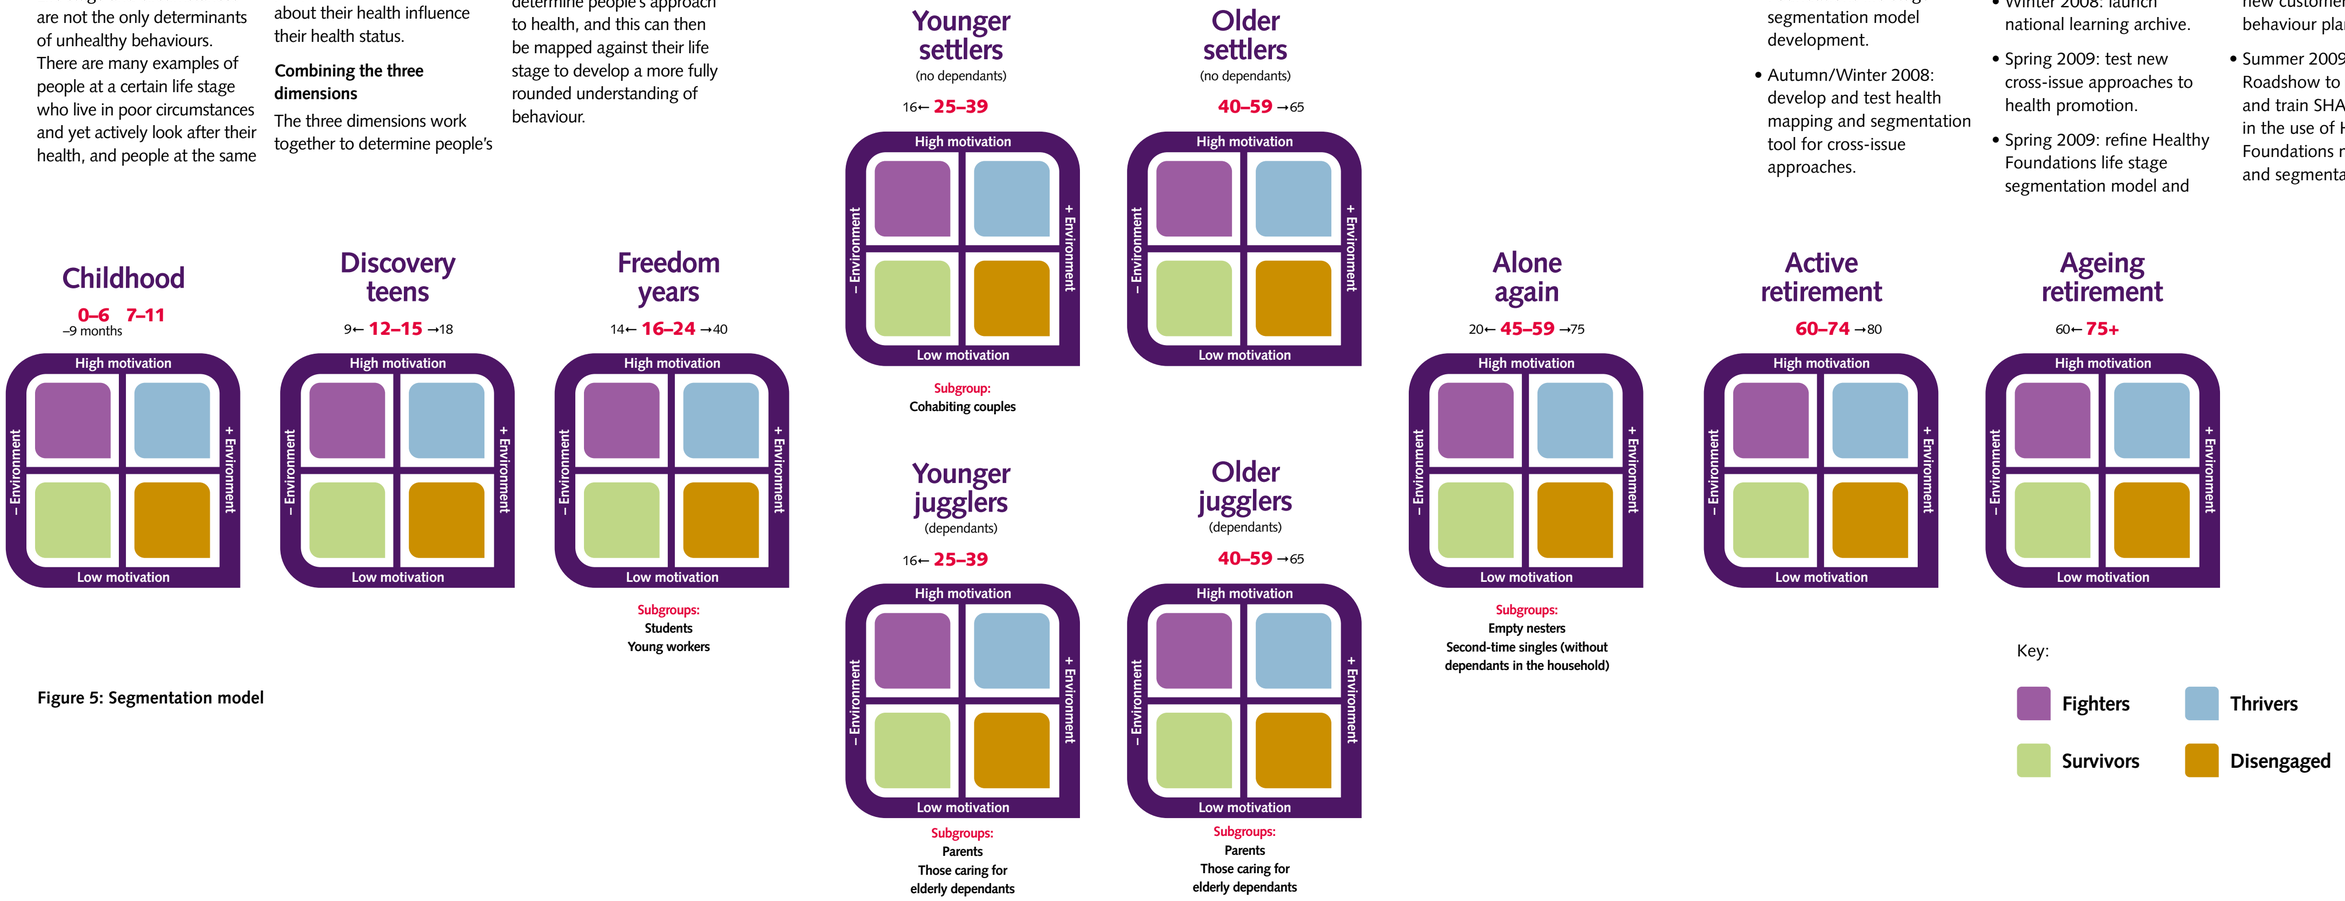


Figure 5: Segmentation model

Health insight programme

- Autumn 2008: first stage validation of Healthy Foundations life stage segmentation model development.
- Autumn/Winter 2008: develop and test health mapping and segmentation tool for cross-issue approaches.
- Winter 2008: NSMC establishes 'one-stop market research shop'.
- Winter 2008: launch national learning archive.
- Spring 2009: test new cross-issue approaches to health promotion.
- Spring 2009: refine Healthy Foundations life stage segmentation model and share insight with SHAs and PCTs.
- Spring 2009: establish new customer insight and behaviour planning service.
- Summer 2009: Regional Roadshow to promote and train SHAs and PCTs in the use of Healthy Foundations mapping and segmentation tools.

Health innovations

Goal: the goal of this programme will be to put social marketing principles into action in local, regional and national settings and to create a central resource for sharing knowledge on effective behavioural interventions across local, regional and national settings.

Social marketing is a way of working – not a strategy in itself. It can be used alongside other behavioural interventions to address public health issues. We need to learn which evidence-based interventions work best and then share that knowledge.

We will continue to demonstrate innovation with behavioural interventions that make the best use of new technologies (NHS LifeCheck and the NHS Choices website, for example). We will learn from and build on the roll-out of key community initiatives like the NHS health trainers programme (which provides one-to-one supports to help individuals tackle health issues).

We will also explore:

- new models of health learning (via the health literacy programme);
- new and emerging health behaviour change tactics; and
- tools used in the commercial and public sector.

Activmobs: Local residents get active

Activities focused on people's interests improve health outcomes

In collaboration with the Design Council, Kent County Council is pioneering an innovative approach to help people to get active. The Activmob scheme empowers people to take exercise at a time and in a place that suits them.

The approach

A team including officers from Kent County Council, representatives from the Design Council and residents of a Maidstone housing estate consulted youth club leaders and a community support officer (among others). Workshops were held to identify the issues that were of greatest concern to residents: residents' daily routines were mapped out and activity 'flashcards' were used.

The process revealed that there are barriers to activity in traditional settings for many residents, and that new services should support the integration of activity into residents' everyday lives.

The solution was 'Activmobs', a radical new initiative designed to support self-organised groups of people to maintain an active life. As part of the pilot, residents created three 'mobs':

- one for people who walked their dogs and wanted to lose weight;
- one for individuals with back problems; and
- one for people interested in guided walks.

There are now four mobs registered on the website (www.activmob.com), and several others are in the process of being developed and supported.

Quantitative and qualitative feedback has been gathered, and the benefits of these mobs have been recorded. Findings have helped the local authority to better understand how to go about tackling changing health issues and lifestyles.

Outcomes and learning

The Activmob scheme increased opportunities for physical activity, which is proven to have significant health benefits and to result in long-term savings to health and social care services. Involvement in the scheme produced tangible, measurable improvements in personal well-being, such as improved sleep and greater physical flexibility.

Testing out our insight and segmentation hypothesis

The healthy foundations life stage segmentation model research looks at behaviour across a number of our key priority areas: obesity, drug and alcohol misuse, smoking, sexual health and poor mental health.

We will be carrying out bespoke research to fully explore, populate and validate the segmentation parameters. This will be completed by autumn 2008.

Addressing related health issues

The relationship between harmful behaviours (such as eating too many energy-dense foods, drinking too much alcohol or having unprotected risky sexual encounters) is often not explored. Even when there is evidence that certain behaviours (for example, binge drinking and sexual health) are related, mechanisms are not always in place to combat the link.

We will be commissioning and funding innovative local and regional programmes that address cross-cutting issues by focusing on the individual rather than on the health issue in isolation. This will help us to build up an evidence base for what works. There will be a particular focus on marginalised groups (particularly black and minority ethnic groups), and on how social marketing interventions can reduce health inequalities among them.

This work will complement the NSMC's demonstration projects (part of the 'Health capacity' programme).

Creating a knowledge base

Building on the experience gained as a result of the smoking, sexual health and healthy eating programmes, we will strengthen communication between national health promotion programmes and regional and local efforts.

We will ensure that all front-line public health staff know about national efforts, and equally that national programmes are built on intelligence and experience gained at the local level. This will involve creating a robust system for information sharing across all public health programmes and ensuring a cohesive central point of contact for Public Health interventions across DH. This system will be scoped in Summer 2008.

Using the Healthy Foundations life stage segmentation model, we will create a network of social marketing champions who will work within and across local and regional areas and sectors to champion this approach. The network will be in place by autumn 2008.

We will work with those already delivering social marketing and health improvement interventions in the NHS to create a new central resource. It will be a place to access social marketing know-how and to share knowledge, and it will be of crucial importance to the social marketing champions.

Healthy choices for kids: Brighton's childhood obesity campaign

Brighton and Hove City Teaching PCT commissioned a campaign aimed at tackling obesity in children aged 8 to 11. It was delivered by Brilliant Futures, a social marketing organisation, and The Priory Partnership, a media and PR company. The objectives of the campaign were to change children's attitudes and behaviours in relation to healthy living, to increase parents' awareness of the causes of obesity and to encourage lifelong participation in healthy activities.

The approach

Focus groups and questionnaires were used to gain an insight into existing levels of knowledge about healthy eating, into motivation and into attitudes towards healthy eating among children and teachers.

A variety of events and initiatives took place as part of the campaign:

- There was a high-profile campaign launch, with a letter sent to all local primary heads and personal, social and health education co-ordinators.
- One-day workshops took place in schools and community venues, featuring fun and practical activities based around healthy lifestyle choices.

- A three-week healthy challenge was held, featuring a 'passport' (promoting the Active for Life website at www.activeforlife.org.uk), with prizes for children who completed all of the tasks.
- A half-term 'fun day' took place, at which children and parents had the opportunity to try cooking healthy food, to receive a free recipe book, to play football with Brighton & Hove Albion, and to buy fresh fruit and vegetables at low prices.
- A local PR campaign was run.

Outcomes and learning

A post-campaign evaluation showed that children had retained knowledge, and introduced new food and exercise into their home and school lives.

The question 'Did the workshop encourage children to make healthy choices?' produced a high mean score (4.7 out of a maximum of 5), and there was a substantial increase in the numbers of people accessing the Active for Life website.

Behaviour change – theory into action

We plan to create a learning culture at DH that will draw on the experience and knowledge of practitioners and experts. This will provide practical, evidence-based support for exploring new approaches to health improvement.

Our first step will be to commission a review of current health behaviour change interventions. We will also set up a system for gathering information about what is being done abroad and for keeping up to date with innovations.

We will build on the three developing personal health projects that place the consumer at the heart of their development:

- NHS health trainers programme;
- Health literacy; and
- NHS LifeCheck.

NHS health trainers programme

This community participation scheme, run by PCTs, recruits and trains individuals to become health trainers who are drawn from the local community or are knowledgeable about the community they will serve.

These individuals are then able to offer one-to-one support and training on health issues, and to provide advice on accessing appropriate health services.

NHS health trainers are a visible and accessible link between health practitioners and disadvantaged communities. The majority of the NHS has signed up the scheme, and 1,200 health trainers are already in place.

Prisons have made great strides with the programme (there are currently around 80 health trainers working in prisons) and the Army has trained 2,450 physical training instructors. Boots, National Pharmacies, the Royal Mail and the Football Foundation have all signed up to the programme, and there are two national awards (City & Guilds Level 3 and Royal Institute of Public Health Level 2).

Health literacy

The core principle of the health literacy programme is that learning about health can be combined with improving basic skills in literacy, language, and numeracy – as part of a 'two for one'-type method called 'embedded learning'. The programme is a partnership between two government departments – DH and the Department for Innovation, Universities and Skills (DIUS) – and the health and education charity ContinYou.

Learners' responses to the programme have been inspiring, and the results have already been encouraging: individuals have been able to develop their literacy skills at the same time as improving their diet and losing weight.

The second phase – involving projects in prisons, local government, libraries, museums and Royal Mail – began in autumn 2007, and further phases are planned.

NHS LifeCheck

The NHS LifeCheck programme was conceived as a result of the *Your health, your care, your say* public consultation (published by DH in January 2006), in response to people's desire to take more responsibility for their own health and well-being. Three LifeChecks are under development – for Early Years, Teenagers and Mid-life – adopting a similar process of an easy-to-use health assessment and behaviour change tool that helps people to assess and manage their own health through the major life stages and beyond.

By helping people to see how their current lifestyle choices might affect their health,

Personal trainers for health

Bolsover District is ranked 31 in the bottom 50 (most deprived) local authorities (IMD 2004) in England. With such high rates of deprivation and ill health within its boundaries, the populations of Shirebrook, Creswell and Langwith experience the worst health outcomes within the district.

Health trainers and the development of a network of community volunteers for health have been seen as a positive step in improving lifestyle within the district and a key strand in driving down the heart attack rate in North East Derbyshire.

supporting them in setting *SMART* behaviour change goals, and pointing them in the direction of useful information and resources (including their GP or health professional), NHS LifeCheck is giving individuals the opportunity to make positive health changes at their own pace.

The Teen and Early Years LifeChecks are being prepared for the start of a phased national roll-out, starting in autumn 2008. It will initially focus on the 83 Community for Health areas followed by all other areas in England in January 2009. The Mid-life tool is currently being prepared for a series of pilots. The tools have the potential to be used to great effect in deprived areas, encouraging those at highest risk of ill health to carry out an assessment and to act on the results, where available with the support of health trainers.

Ultimately, the intention is that people will be able to access NHS LifeCheck in a wide variety of settings, including local surgeries, pharmacies, voluntary organisations, leisure and community centres, children's centres, sheltered housing and schools.

NHS Choices website

The NHS Choices website (www.nhs.uk) has been developed to offer consumers better choice, greater convenience and more control over their health. It aims to personalise healthcare by providing people with a wealth of practical information about health-related issues such as smoking, drinking and exercise, as well as offering guidance on finding and using NHS services.

The website draws together the knowledge and expertise of NHS UK, the National Library for Health, NHS Direct, the Information Centre for Health and Social Care, the Healthcare Commission, and numerous other health and social care organisations.

Key milestones

The following are the key milestones for the 'Health innovations' programme:

- Autumn 2007: second phase of health literacy programme launched.
- December 2007: NHS LifeCheck pilot began.
- Spring 2008: launch NHS LifeCheck on NHS Choices website.
- Spring 2008: scope knowledge-sharing resource.
- Spring 2008: commission horizon-scanning service.
- Autumn 2008: validate Healthy Foundations life stage segmentation model.
- Winter 2008: launch NHS Mid-life and Early Years LifeChecks.
- Autumn 2009: national evaluation of health trainer programme takes place.

“

For those of us who've worked in social marketing for many (many) years, what is now happening in the UK – particularly within the Department of Health – is extremely exciting, and an inspiration to the US. Learning from each other is vital in the development of social marketing; learning what works – and (if not more important) what doesn't work – helps social marketing practitioners to develop and improve their work.

”

Nancy Lee, President of
Social Marketing Services Inc,
Washington DC

Health partnerships

Goal: the goal of this programme will be to establish effective local and national partnerships with the private and third sectors to promote good health.

Who do the public trust?

Last year's Edelman Trust Barometer showed that trust in the Government had dropped by nearly half – from 33 per cent in 2006 to just 16 per cent in 2007. The UK also shows declining levels of trust in traditional and new media, and advertising is the least trusted information source (8 per cent).

Society is changing and people are ever more selective (and at times cynical) about the messages they are bombarded with. But partners play an essential role in influencing and shaping people's behaviour. Action by individuals and by the Government must be aligned with that led by communities, third sector organisations and business.

There is already a broad range of partnerships in place between the public sector and the private and third sector, and much good work is happening. The Business in the Community (BiTC) scheme proves how cross-sector partnerships are already working to improve people's lives, and the Communities for Health programme is another example of how local authorities and the NHS are working together to improve health and reduce health inequalities.

Although partnership working is not new, more needs to be done to embed it into what we do. We need to set up robust yet flexible frameworks that will enable partnerships to fulfil their potential. We will invest more effort in proactively building working partnerships at the national, regional and local level.

A '**partnership for health**' is a short- or long-term working relationship between two or more organisations to inform strategies and related actions to improve health. The partnership must function within a set of open and transparent operating parameters and in line with government guidance relating to good practice and governance.

The diagram opposite sets out the three broad areas of strength that organisations can bring to a partnership: infrastructure, content and organisational reach.

Figure 6: Partner typologies

Team approach to tackling young people's health: Nationwide initiative builds partnership between sports clubs and communities

The BiTC scheme helps companies to maximise their positive impact on society. It created the 'Clubs that Count' programme as a way of helping professional sports clubs to develop and share best practice in social and environmental responsibility, and to improve their positive impact on local communities.

Approach

Professional sports clubs traditionally have close links with their local communities, many of which are disadvantaged (64 per cent of professional football and rugby league clubs are in deprived neighbourhoods, and 61 per cent of football league clubs are in areas with significant or high black or minority ethnic populations).

The Clubs that Count initiative uses sporting brands to make contact with people who are normally difficult to reach and unreceptive to health messages. As well as advising and supporting clubs in their community activities, it also measures how successfully they are implementing their corporate social responsibility policies, identifies gaps in delivery and gives advice on how they can improve.

Clubs that Count has engaged over 50 football, rugby and basketball clubs over the last two years, and these clubs are tackling a wide range of health issues in innovative ways. Manchester City FC has a track record of using a combination of its brand appeal, football and partnerships to tackle social issues such as ill health, drug use, sexual health and unemployment. The club was awarded a 'Big Tick' in BiTC's Health Communities Award (sponsored by BUPA and supported by DH) for its City in the Community initiative.

Outcomes and learning

Participating clubs report on their work to BiTC annually via the Clubs that Count online tracker. By doing so, they demonstrate their commitment to improving their positive social impact, and prove the value of sports clubs as partners for promoting healthy lifestyles – particularly to people who are usually hard to reach.

Identifying the challenges and perceived barriers to partnerships

In response to the publication of *Health Challenge England*, we put together a series of regional roadshows to give key stakeholders (senior figures drawn from the public, private and third sectors) the opportunity to discuss how they could work together to deliver its seven key principles – one of which was forging new partnerships.

Some very useful feedback emerged from the roadshows:

- Stakeholders feel that there is a need for greater investment – in terms of time and resources – in partnerships.
- Although there was a great deal of enthusiasm for developing partnerships, there was a perception that there is an apparent lack of funding – from PCTs and the third sector – for these projects.
- There is a desire to find common ground to work with the private sector.
- Working with the private sector can add real value, as it can provide access to resources, expertise and key target groups.
- There was also some unease about working with the private sector: stakeholders don't know how to approach companies, or feel nervous about being seen to condone certain products (such as alcohol, food or tobacco).
- There was also concern that national partnerships with private organisations do not always meet local needs.

Understanding our partners

In September 2006, we commissioned research to gain more of an understanding of the motivations for and barriers to working in partnership. We were particularly interested in exploring the issues involved with partnering with HID to deliver social marketing initiatives for health improvement.

The research involved a series of one-to-one interviews and five in-depth case studies. These were carried out with senior executives from organisations from the private and not-for-profit sectors, including Pepsi, Tesco, Cancer Research UK, Sky and Barclays.

The resulting research paper, *Health Improvement Partnerships*, showed that DH has a pivotal role to play in improving health outcomes in England – through policy and regulation, and through delivery. It found that 90 per cent of respondents were willing to work with DH, as long as the terms of engagement were clearly defined. Respondents emphasised that the key to success was an effective, streamlined and well-managed process, with all partners involved from early on in designing initiatives and delivery mechanisms.

The following concerns emerged as a result of the roadshows, and need to be addressed:

- There is not enough of a coherent, joined-up government strategy on

other issues that affect health outcomes.

- 'Short-termism' on the part of the Government – frequent, mid-stream changes in policy and cautiousness about committing resources for the long term – is a worry.
- There is too much of a focus on treating ill health rather than on promoting good health.

Responding to the challenge – developing effective partnerships

We have set in motion a collaborative process for coming up with recommendations on how to develop and sustain effective cross-sector partnerships. Acting on the feedback from the roadshows, we have commissioned the NSMC to explore the most appropriate and consistent approach to developing partnerships. This primarily focuses on partnerships led by the Health Improvement and Protection Directorate for the Minister of State for Public Health.

We propose to develop a working group and a steering group at the national level in order to come up with recommendations on how to develop and sustain partnerships. The key deliverables will be:

- a guidance paper that sets out the objectives, structures and mechanisms for partnership development;
- a supporting document that outlines the strengths and weaknesses of the options considered, and the rationale for selecting the preferred one; and
- clear evidence of stakeholder support for these recommendations.

These are all due to be produced by summer 2008.

Enabling partnerships to flourish

In response to the concerns raised as a result of the regional roadshows – particularly relating to the lack of funding – we have established a £1 million per annum partnerships capacity-building fund to provide local and regional support for building partnerships. The bulk of this funding will be distributed equally to the 10 SHAs to support partnership-building activity when the fund is launched in autumn 2008.

We also intend to use the funding to reward those social marketing intervention initiatives that are already engaged in partnership work. This will be a major boost to these organisations and will encourage other new initiatives.

The new funding reinforces our commitment to developing robust, successful partnerships across the regions. Working with the NSMC, DH will develop fixed criteria for accessing it.

ChaMPs Public Health Network 'Snack Right' project: Changing the snacking behaviour of two- to four-year-olds in the Cheshire and Merseyside area

The ChaMPs Public Health Network (the public health network for Cheshire and Merseyside PCTs, local authorities, NHS trusts and wider health organisations) social marketing group developed a project based on social marketing principles to improve the snacking habits of under-fours from lower socio-economic groups. The initiative was called Snack Right.

Approach

The project began with competition analysis of the influence of big-brand advertising on purchasing decisions. Having concluded that any ChaMPs campaign would need to wield brand power of its own, the group commissioned the creation of a brand for Snack Right.

It was decided that a partnership – particularly with a company from the retail sector – would be highly advantageous to the project. ChaMPs looked at several possible partners before approaching the Aldi supermarket chain. It was considered most suitable for several reasons:

- its stores were in relevant locations;
- its own-brand goods appealed directly to the target audience;
- it had a local supply policy of fresh produce; and
- it had signed up to the Healthy Start welfare voucher scheme.

Snack Right was also supported by children's centres and local PCT practitioners, including health visitors and paediatric dieticians who were known to the target group.

The target audience took part in focus groups designed to establish which social marketing interventions would support sustained behaviour change in their children's eating habits. Interventions included a targeted leaflet drop to 113,000 households, 15 public events and a media campaign.

At the Snack Right public events, children were able to taste fruit and vegetables (provided free by Aldi), and parents learned how to prepare healthy snacks. There was also information available about health, nutrition and Healthy Start vouchers.

Outcomes and learning

Liverpool John Moores University is currently carrying out an objective evaluation of the Snack Right initiative. However, one indication of its success that is already apparent is the significant increase in applications for Healthy Start vouchers that occurred in the region during the campaign period.

Ambitions for partnerships

Partners from different sectors are inevitably going to have different strengths and different (sometimes opposing) goals – this is frequently the case with private organisations and those from the third sector. The challenge is to find common ground, maximising organisations' strengths and avoiding any potential areas of conflict.

Our health partnerships programme will make it easier for private companies, organisations from the third sector and individuals to make a contribution to health promotion programmes. By the end of 2008, we aim to have at least 15 fully developed partnerships in place. These will build on existing activity and will reflect our new model of working.

The aim is to set up a partnership framework that is broad enough to encompass a wide range of partners, and flexible enough to allow them to operate autonomously within defined parameters. The framework should identify:

- audience priorities;
- key behaviours to be influenced;
- insight into audience behaviour; and
- any technical policy issues ('rules') that we want people to operate within.

The framework should enable partners to turn their interest in an audience or an issue into some form of practical action, with the benefit of knowing that they are backed up by a national approach. The '5 a day' programme is an example of how this can work.

Learning from 5 a day

The overall goal of DH's 5 a day programme is to increase people's consumption of fruit and vegetables from an average of fewer than three portions a day to at least five portions a day. The ultimate success of the programme is largely dependent on the efforts of a range of marketing partnerships – between the Government and food retailers, caterers, food manufacturers, pubs and clubs.

While the overarching message of the campaign is consistent ('Helping you (the consumer) to enjoy the benefits of eating more fruit and vegetables'), partners will have different reasons for getting involved.

- The message for private sector partners is 'Helping you to enjoy the commercial benefits of increased fruit and vegetable consumption – you'll be missing out if you don't join in'.

- The message for non-commercial partners is 'Helping others to enjoy the benefits of eating more fruit and vegetables'.

The 5 a day framework is successful because it allows partners a great deal of flexibility in how they promote the campaign. Partners can either use the campaign logo or their own logo (as long as it conforms to DH healthy eating criteria). Equally, they can either develop their own marketing collateral (as several large retail chains have), or use that supplied by DH (an option that organisations with smaller marketing budgets are likely to adopt). The key is that the message remains consistent – however it is delivered.

Finding common ground

There are many reasons for organisations deciding to work in partnership with the Government, but they can be broadly grouped into three categories:

- **Operational impact:** for example, a private sector company might want to sell more units, and a third sector organisation might want to achieve a behaviour related goal (e.g. reducing the incidence of cancer).
- **Corporate social responsibility:** an organisation might decide that it is in the interests of corporate social responsibility for them to work with the Government – although the organisation will only ever be able to allocate a limited proportion of money to this end.
- **Employee well-being:** the vast majority of organisations recognise that their staff are their biggest asset, and that there are big advantages to keeping them healthy.

Figure 7: Organisation partner objectives

Employee well-being

Engaging a variety of partners from different sectors (often with conflicting motivations and attitudes) and encouraging them to collaborate is not easy. But figures from the Health and Safety Executive (HSE) show that 40 million working days are lost to occupational ill health and injury every year in the UK. This figure is a compelling incentive for organisations to work together to improve employee health, and is an ideal way of creating a shared goal among organisations that might otherwise be ideologically opposed.

The workplace is a neutral setting in which to reach those who are most at risk of ill health. Making sure that employees are healthy brings benefits to the employee in terms of well-being, brings corporate benefits in terms of improvements in productivity and brings public benefits in terms of reduced costs to society.

The private sector already sees workplace well-being as a non-confrontational arena in which to build effective working relationships with the Government and the third sector. It is an environment that is largely free from competitive friction, and is an area that can help to build trust across sectors, potentially allowing more challenging partnerships to be created in future.

In 2006, Dame Carol Black was appointed as the first National Director for Health and Work – a role in which she leads initiatives to promote and improve health in the workplace. Dame Carol Black will play a significant role in ensuring that the workplace health commitments outlined in *Health, work and well-being – Caring for our future* (published by the Department for Work and Pensions (DWP) in 2005) and in the *Choosing Health* White Paper are delivered.

> People who work are healthier, wealthier and live longer than the unemployed. The benefits to the individual are clear; but employers also have much to gain. A motivated and engaged workforce is far more productive and efficient. It also dramatically cuts the cost of unnecessary sickness absence, which is no better for the individual than it is for business. Ultimately, investment in workplace health will yield multiple returns.
>
> Dame Carol Black

Working towards better health: Investors in People (IiP) focuses on employee well-being

Absenteeism caused by workplace stress is commonly regarded as the clearest indicator of an 'unhealthy' organisation. DH has created a partnership with IiP in order to start to tackle the issue, and this has given the department access to a wide range of businesses.

Approach

The IiP Standard is a business improvement tool designed to improve organisations' performance through their people. DH saw the advantage of teaming up with IiP to try to develop a health and well-being element within the existing Standard.

The resulting Health and Well-being Framework has already been tested in pilots with over 200 organisations, including Unison, Scottish Provident, the Royal Liverpool Children's NHS Trust and Peterborough City Council. More than 100,000 employees were involved.

The second phase of the pilots was completed at the end of February 2007, and a third phase will test the robustness of the final framework. There is now an online health and well-being self-check tool on the IiP website, along with a database providing a wide range of good practice examples (including cost-free options).

Outcomes and learning

This blend of government and industry skills and experience is producing work that neither sector could have developed alone. And evaluation of the first pilots revealed that 78 per cent of the organisations feel that the new health and well-being criteria should be integrated into the IiP Standard when it is next revised.

Pledging our support for health partnerships

We plan to publish recommendations on how to maximise the private sector's contribution to improving health. We will also develop clear terms of reference and a charter for business support for health promotion programmes.

We will scope an idea for organisations to commit to a 'health pledge' and to become recognised health partners, and will publish a list of commercial and third sector organisations that are already working with the Government to promote and improve people's health.

We will also emphasise the development of long-term relationships with the third sector, and will strengthen the third sector Public Health Forum so that it can act as a national resource for developing

partnership programmes between the Government and the third sector.

Action on partnerships – a fully integrated approach

Although there is much good work already happening at the local, regional and national levels, real steps forward will only be made when there is cohesion between all of these levels.

Building on the health programme leads briefing process that is already in place, DH plans to set up a new system through which those leading national programmes will be able to communicate with those delivering health improvement programmes at the local level. This will ensure that national programmes are informed by knowledge from the front line, and that local staff are fully aware of national programmes (and can plan to work with them). The network of health champions will also have a role to play across both the public and private sectors.

Given the thousands of organisations involved, we will not attempt to control this broad coalition or to ensure perfectly joined-up delivery – this would be a vast and cumbersome task. Rather, we will encourage organisations to take part (making it easy for them to do so) and to make a public pledge of their commitment.

In addition to guidance on joint working between the NHS and the private sector, we will also publish guidance on commissioning and evaluating social marketing initiatives.

DH will actively seek out and build partnerships with other government departments, and establish stronger systems for making sure that its efforts are co-ordinated with NHS-led efforts. We will develop proposals with the private sector that will help local companies, the NHS and other stakeholders to work together to improve health.

We will also celebrate success with the BiTC Awards for Excellence. These are designed to recognise the best company, charity, social enterprise, community and individual efforts to improve health.

Connecting national and local activity

We need to work across the regions in order to link national-level partnership activity with what happens at the local level. But there are already effective mechanisms in place for regional communications and delivery – rather than reinventing these, we aim to replicate or build on them.

Regional development agencies (RDAs) offer an excellent opportunity to engage more closely with organisations from third sector and with commercial private sector companies. And we can gain access to the RDAs by working closely with BiTC's regional arm, with our Regional Directors of Public Health (RDsPH) and with Government Office Directors.

We will also explore the role of local area agreements and local strategic partnerships to help to encourage local authorities to consider partnership approaches. And involvement from the Department for Communities and Local Government will be essential.

Working with the Department for Business, Enterprise and Regulatory Reform (previously the Department of Trade and Industry), we will identify the regional networks of the Federation of

Small Businesses and the Confederation of British Industry, building on our regional reach and our engagement with the local private sector. This approach will enable us to target small and medium-sized enterprises (SMEs) – specifically those with between 10 and 50 employees. Engaging SMEs will be a crucial element of our partnership strategy.

The agenda set out in *Health, work and well-being* has been a compelling incentive for the private sector to engage with public health. The joint work carried out in this area by Dame Carol Black, the HSE and the health, work and well-being team at DH is already well established.

At the regional level, sound financial arguments are clearly a good way to engage the private sector. The recent Judge Business School cost-benefit analysis, which counts the true cost of ill health, will provide an opportunity to develop a dialogue with the private sector on employee well-being and its relationship with increased productivity.

Key milestones

The following are the key milestones for the 'Health partnerships' programme:

- Summer 2008: have in place draft proposals for joint NHS, third sector, social enterprise and private sector partnerships.
- Summer 2008: scope proposal for partnerships capacity-building fund.
- Summer 2008: scope and review existing health improvement partnerships within DH.
- Autumn 2008: draft proposals for the commissioning and evaluation of social marketing initiatives.
- Autumn 2008: build on the NSMC's national partnerships development project.
- Winter 2008: launch the partnerships capacity-building fund.
- Spring 2009: have in place 10 new models of partnership working.

Action plan

Health capacity

Health capacity programme

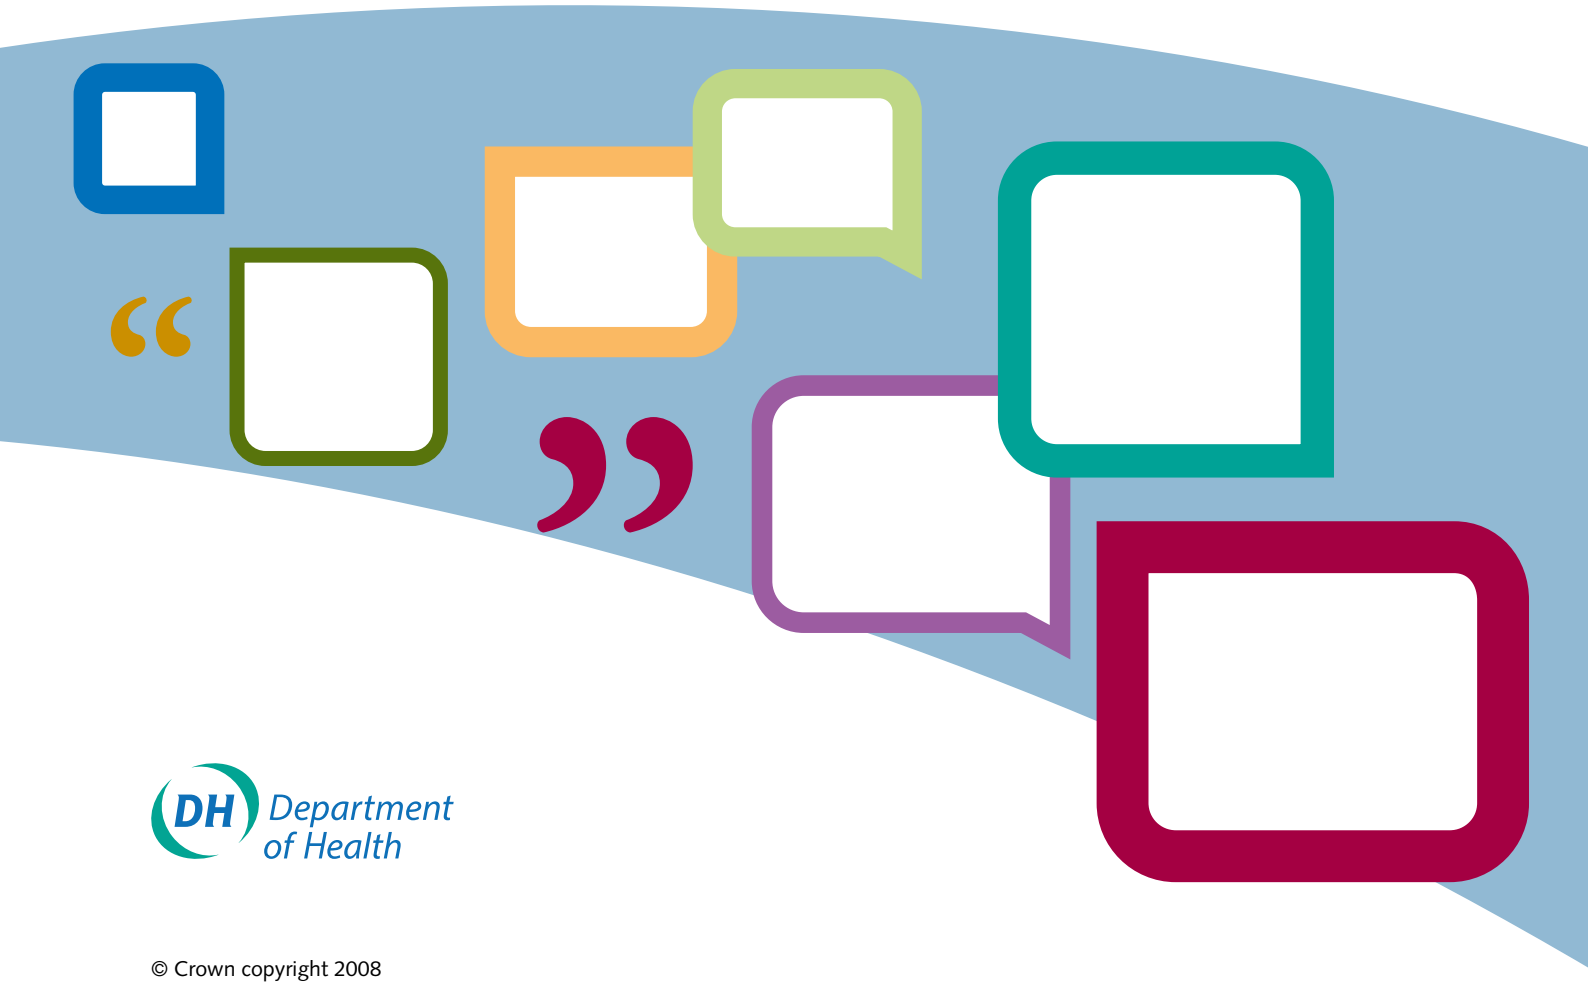
- Spring 2008: publish social marketing ethics guidelines.
- Autumn 2008: first World Social Marketing Conference takes place.
- Autumn 2008: publish social marketing planning guide and compendium of case studies.
- Ongoing: implement capacity, training and skills programme for those working in public health.

Health insight

Health insight programme

- Autumn 2008: first stage validation of Healthy Foundations life stage segmentation model development.
- Autumn/winter 2008: develop and test health mapping and segmentation tool for cross-issue approaches.
- Winter 2008: NSMC establishes 'one-stop market research shop'.
- Winter 2008: launch national learning archive.
- Spring 2009: test new cross-issue approaches to health promotion.
- Spring 2009: refine Healthy Foundations life stage segmentation model and share insight with SHAs and PCTs.
- Spring 2009: establish new customer insight and behaviour planning service.
- Summer 2009: Regional Roadshow to promote and train SHAs and PCTs in the use of Healthy Foundations mapping and segmentation tools.

Health innovations



Health innovations programme

- Autumn 2007: second phase of health literacy programme launched.
- December 2007: NHS LifeCheck pilot began.
- Spring 2008: launch NHS LifeCheck on NHS Choices website.
- Spring 2008: scope knowledge-sharing resource.
- Spring 2008: commission horizon-scanning service.
- Autumn 2008: validate Healthy Foundations life stage segmentation model.
- Winter 2008: launch NHS Mid-life and Early Years LifeChecks.
- Autumn 2009: national evaluation of health trainer programme takes place.

Health partnerships

Health partnerships programme

- Summer 2008: have in place draft proposals for joint NHS, third sector, social enterprise and private sector partnerships.
- Summer 2008: scope proposal for partnerships capacity-building fund.
- Summer 2008: scope and review existing health improvement partnerships within DH.
- Autumn 2008: draft proposals for the commissioning and evaluation of social marketing initiatives.
- Autumn 2008: build on the NSMC's national partnerships development project.
- Winter 2008: launch the partnerships capacity-building fund.
- Spring 2009: have in place 10 new models of partnership working.

Department of Health

Healthy Foundations

A segmentation model

NHS

Introduction

This is a summary of a segmentation exercise carried out in 2006 by a dedicated Department of Health (DH)/COI blended team.

The research team comprised social marketing experts from DH public health and mental health policy and communications teams, the National Social Marketing Centre (NSMC), academics and private sector marketing experts including Leslie Butterfield CBE and Sarah Heard.

The aim was to build on existing research and knowledge within DH and academia to arrive at a segmentation of the population of England, looking at the drivers of behaviour across the six public health priority areas.

The research used epidemiology, social and consumer research and the public health targets to produce a model to target audiences.

The model is intended as a building block for a customer-focused approach to the development of health behaviour change interventions. It should *not* be viewed solely as a segmentation for informing communications.

The use of segmentation is not new to DH. However, at present there is no single consistent approach to segmentation across different public health target areas.

One of the objectives of this project was to develop a segmentation framework or model that can be applied across issues, thereby giving a '360 degree' picture of the population rather than a series of overlapping views of people from the perspective of each issue.

Pulling the three dimensions together we are able to create a rich picture and model and a consistent approach for DH. It should be acknowledged that working with three dimensions rather than two is relatively unusual in health segmentation models, although the approach is frequently used in commercial applications. It is clear from the research that the task of looking at the entire population in terms of a range of motivations, environment and life stage requires this extra level of sophistication.

Insight is built from demographic, behavioural, psychographic and epidemiological data, prior evidence and intelligence about what has worked elsewhere, together with data about what motivates people, what they say will help them and perceived barriers. There is rarely a 'one size fits all' solution that can be appropriately applied across the population.

Our future health promotion and social marketing programmes will be built on shared insight into audiences, clearly defined through segmentation analysis, to bring about specific behaviour. The approach should lead to a more cost-effective and integrated approach to future research and targeted health interventions within DH.

Producing the model

The research team reviewed more than 80 reports, mapping behavioural drivers and barriers, to identify commonalities across existing target audiences and health issues.

The following factors were considered:

- behaviour/lifestyle;
- attitudes towards health, decision-making priorities, aspirations (and other shared attitudes which may affect health behaviours); and
- knowledge, attitudes and beliefs forming the basis of current behaviours.

The team then interviewed DH stakeholders with an expert understanding of the target audiences currently addressed in campaigns to find out whether the drivers identified matched the stakeholders' own understanding, prioritised them and identified further research. They also held review workshops with

key members of DH, health professionals, academics and segmentation experts.

In this way the team identified three overarching 'dimensions' that had the greatest significance when identifying population segments most likely to adopt 'at-risk' health behaviours, and which work collectively to determine people's ability to live healthily and their likelihood of doing so. These were:

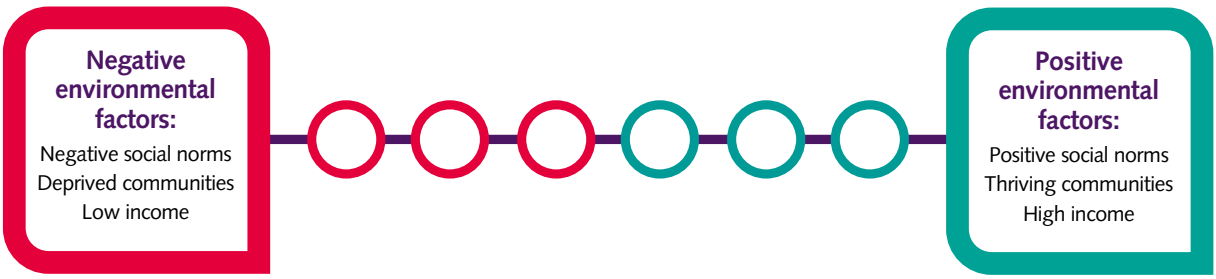
Age/life-stage

It was felt that life-stage is a more realistic measure than age alone, primarily because the concept of a life-stage acknowledges that people develop at different rates. Also, thinking about health from a life-stage perspective provides a view of the population along a health continuum 'from cradle to grave' with a clear role for DH – keeping people on a good health journey or helping them get back on track should they deviate.

The team identified the most critical life-stages and life events to create this model.

Figure 1: Suggested life-stage model

The outer ages form the maximum and minimum ages for that life-stage, while the ages in red form the main or core of that stage. The journey through stages will typically be linear in the first three and last two stages, whereas it is possible for people to move between the 'settler', 'juggler' and 'alone again' stages as they experience different life events.



Circumstances/ environments

Environmental factors play a critical part in individuals' at-risk behaviours in relation to their health, as well as on people's ability to make beneficial changes to their lifestyle. These factors fall into three groups:

- social – being surrounded by positive/negative social norms;
- physical – such as living in a deprived community; and
- economic – such as surviving for long periods on a low income (there is a distinct correlation between long-term unemployment and poor health).

For the purposes of this model groups of factors were placed on an axis resulting in those experiencing the most social and material deprivation at one end and those in better circumstances at the other end of the axis.

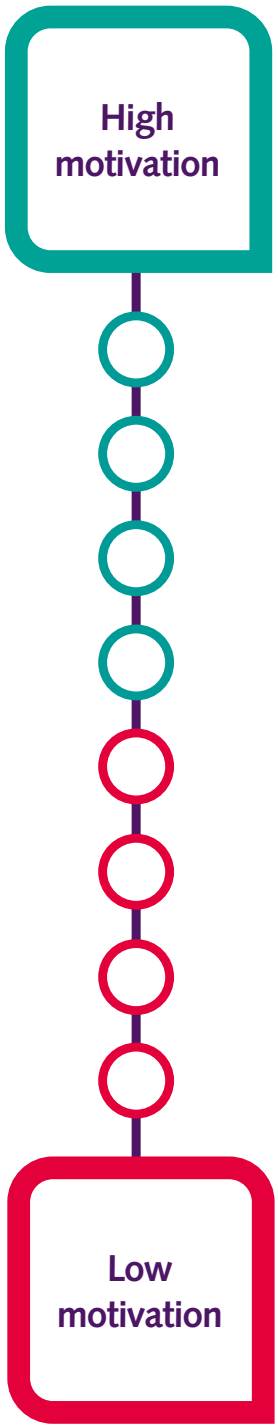
Figure 2: Circumstances/ environments axis

Attitudes/beliefs towards health and health issues

The team highlighted a number of cross-cutting attitudinal drivers influencing at-risk behaviours in relation to the public health priority areas. These included short-term attitudes towards health, complacency about health and lack of self-confidence (which can translate into a lack of belief in one's ability to take positive action in regard to one's health). Some of the measures included were:

- the extent to which they hold a long-/ short-term life view;
- the extent to which they are complacent about the relationship between at-risk behaviours and their health;
- the extent of their confidence in their own ability to make positive changes to their health and wellbeing; and
- the extent to which they take part in at-risk behaviours.

The team highlighted a number of cross-cutting attitudinal drivers influencing at-risk behaviours in relation to the public health priority areas (PSA). These included, amongst other things, attitudes about health and well-being and their belief in their ability to take positive action.



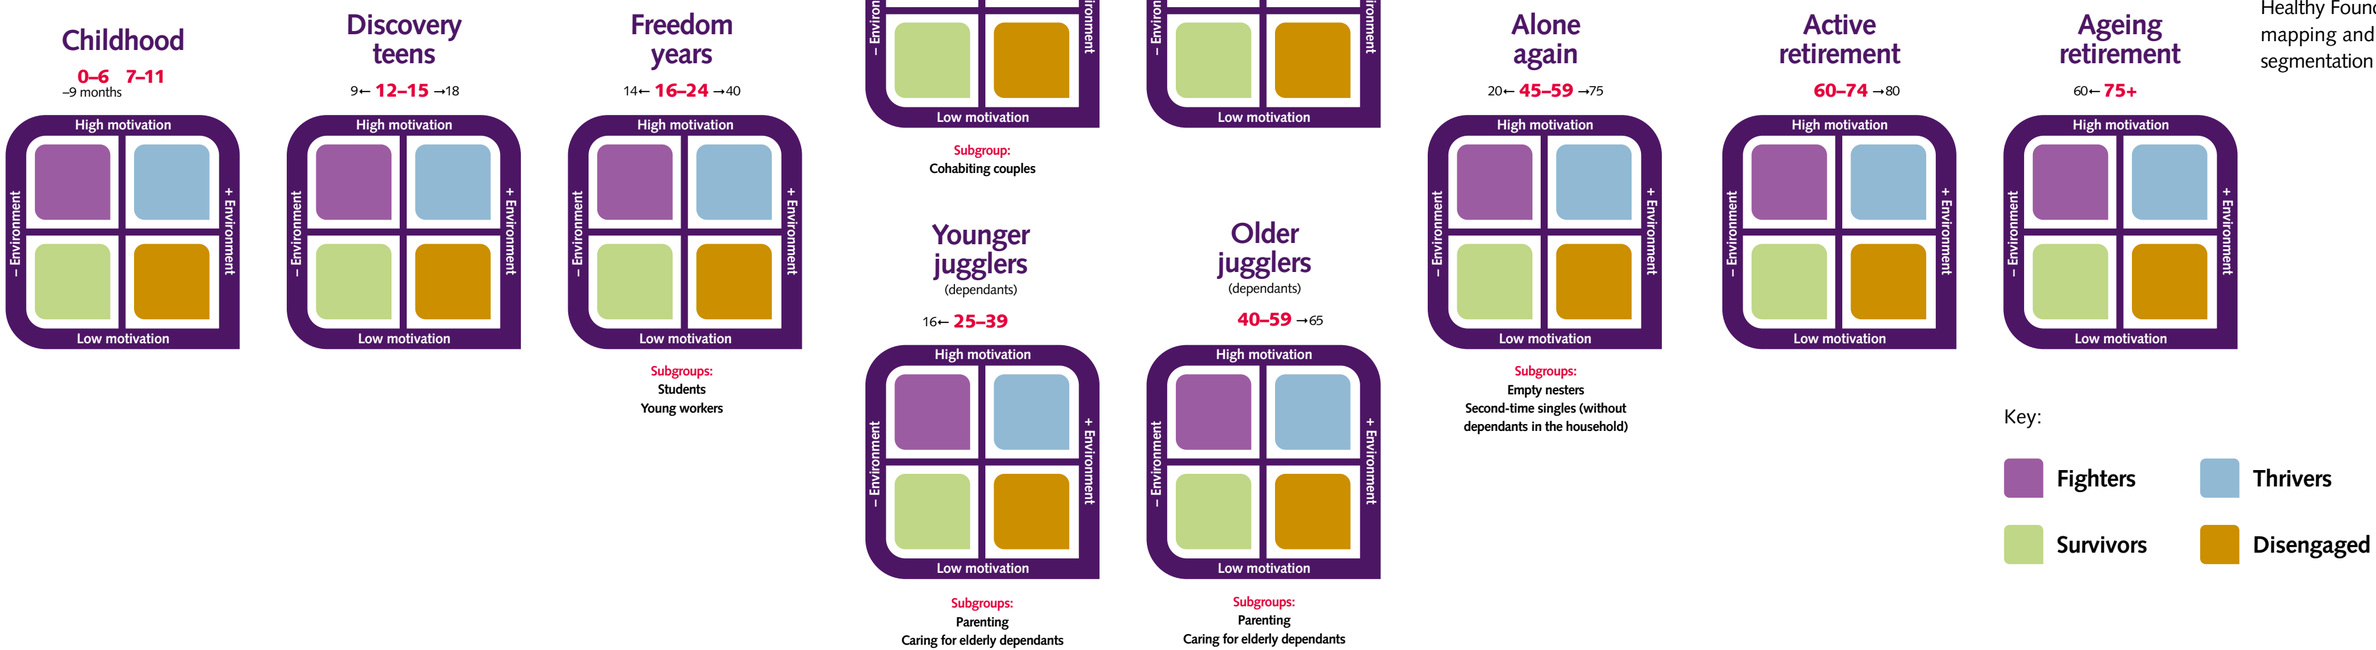


Figure 3: Motivational axis

The segmentation model

The segmentation model pulls together all three dimensions: age/life-stage, circumstances/environments, and attitudes/beliefs. The life-stage is the foundation, with each life-stage then segmented further by circumstances and attitudes into four categories that the team named 'fighters', 'thrivers', 'disengaged' and 'survivors'.

Figure 4: Segmentation model

Health insight programme

- Autumn 2008: first stage validation of Healthy Foundations life stage segmentation model development.
- Autumn/Winter 2008: develop and test health mapping and segmentation tool for cross-issue approaches.
- Winter 2008: NSMC establishes 'one-stop market research shop'.
- Winter 2008: launch national learning archive.
- Spring 2009: test new cross-issue approaches to health promotion.
- Spring 2009: refine Healthy Foundations life stage segmentation model and share insight with SHAs and PCTs.
- Spring 2009: establish new customer insight and behaviour planning service.
- Summer 2009: Regional Roadshow to promote and train SHAs and PCTs in the use of Healthy Foundations mapping and segmentation tools.

Fighters are people living in negative environments but who are standing above their norms, and have a high level of motivation to look after their health. The task with fighters might be to support their efforts in leading a healthy lifestyle despite the challenges facing them.

Thrivers are people living in positive environments and who have a high level of motivation in looking after their health – the group who appear to be on the right track and who are probably least in need of attention. The task with thrivers might be to reinforce their efforts in leading a healthy life, keeping them on the right track.

Survivors are people living in negative environments and who have a low level of motivation in looking after their health. The task with survivors might be to arm them – giving them the confidence and the tools to rise above their environments and improve their motivation to look after their health. Survivors may also be living in such poor circumstances that it is difficult to rise above them. Therefore improving their material circumstances and the quality of the services available to them may be the most important priority.

Disengaged are people living in positive environments but who for some reason have a low level of motivation in looking after their health. This might be conscious rebellion for those in their 'freedom years', or it might reflect putting other responsibilities first to the detriment of their own health (e.g. 'jugglers' putting children or careers first). The task with those who are disengaged might be to alarm them – and raise their awareness of the consequences of their current behaviour.

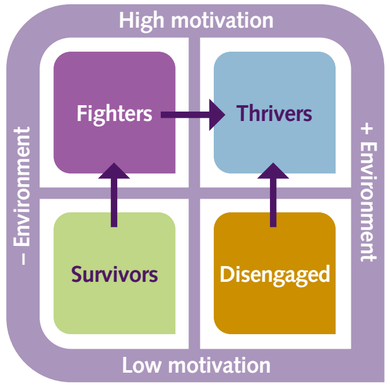
As part of the segmentation model the research team created a number of notional pen portraits of fighters, thrivers, disengaged and survivors within each life-stage. Here, for example, is a typical younger juggler/thriver.

Younger juggler/thriver: Alice (36, Godalming, Surrey)

Alice and Deepak are expecting another baby. Rahul's just one year old, but when they decided to have children they decided to have them close together to minimise the length of Alice's career break.

They had both put a lot into getting their careers established, so having children sooner wasn't something that they really considered – it was only really after they moved from the city that they began to think about it seriously. The house move and preparing for the pregnancy brought about many changes in their lifestyle.

Prior to starting a family they had both tried to keep active, Alice with exercise classes at the gym and Deepak with squash. But Deepak was still overweight and smoked regularly, while Alice smoked a couple of nights a week when she went out with friends, and they had both maintained the habit of drinking heavily on a Friday and Saturday night.



They are now taking their health more seriously. They have both stopped smoking and exercise more frequently, and now that Alice is at home they are eating less processed food. Alice has found the change of lifestyle easy to sustain, she has always been conscious of her weight and knows that the changes will keep her looking good as well as healthy in the long term. Having Rahul has also been a great opportunity for her to meet more people in the local area and she now feels that there are many friends locally she can rely on for support.

Younger juggler

Please note that this is an example only. Detailed pen portraits will be produced as a part of bespoke research in 2008.

Figure 5: Overall aim of the segmentation

The overall aim is to facilitate improvements in people's health and wellbeing in the context of public health priorities and PSA targets. This means moving people up the motivation axis – giving survivors the right tools and prompts to become fighters and giving the disengaged the right tools and prompts to become thrivers.

Moving people along the horizontal axis, i.e. improving their environments, represents a more substantial challenge, given that income and social circumstances are unlikely to improve through promoting health alone. Nonetheless, in the long term the ideal is to improve people's overall environments, both in the sense of social norms and improved access to services, amenities etc. Indeed, there will be some issues for which the key to improvement lies mainly in addressing environmental factors such as poor services or lack of access to exercise facilities.

Older juggler/disengaged: Alan (46, Exeter, Devon)

Alan lives with his two children Max, 17, and Sophie, 15. He and Vanessa finally got divorced last year, because she wanted to move in with a new partner. Vanessa wanted to move outside the local area, so they agreed that the children would live with Alan – although in reality they spend just as much time with Vanessa.

Before the divorce Alan and Vanessa were already drinking most days, at least half a bottle of wine each. The atmosphere was difficult at home, so Alan felt he needed something to help him unwind. After the divorce Alan's drinking increased again, but he doesn't think his consumption is unusually high and he doesn't think it is a problem as he doesn't get drunk and it doesn't interfere with his work.

Although he has yet to make changes to his lifestyle, Alan does worry about his health. He was quite active when the children were young, but doesn't exercise these days. He also knows that he should probably pay more attention to his diet, but he isn't interested in cooking and thinks health food is for fanatics. A recent workplace health assessment told him that his blood pressure was high and he was advised to visit his GP to get the reading confirmed. He hasn't done this yet as, although he sometimes worries about it, he isn't really motivated at the moment.

Older juggler

Please note that this is an example only. Detailed pen portraits will be produced as a part of bespoke research in 2008.

Quantification and profiling

Going forward, bespoke research will be conducted to fully explore, populate and validate the segmentation parameters.

In order to build authority in this work prior to embarking on such a major task, an outline quantification of the segmentation to inform the work-stream was developed using BMRB's Target Group Index, a quarterly survey of over 22,000 English adults.

The validation of the segmentation model will be completed in 2008.

Introduction Explaining social marketing and what it means for the health sector...

How is social marketing different from other approaches? Exploring the benefits of social marketing...

The potential of social marketing Realising the impact it could have...

Social marketing benchmark criteria Developing clear criteria for applying the principles...

Introduction

Social marketing is the systematic application of marketing concepts and techniques to achieve specific behavioural goals relevant to a social good.

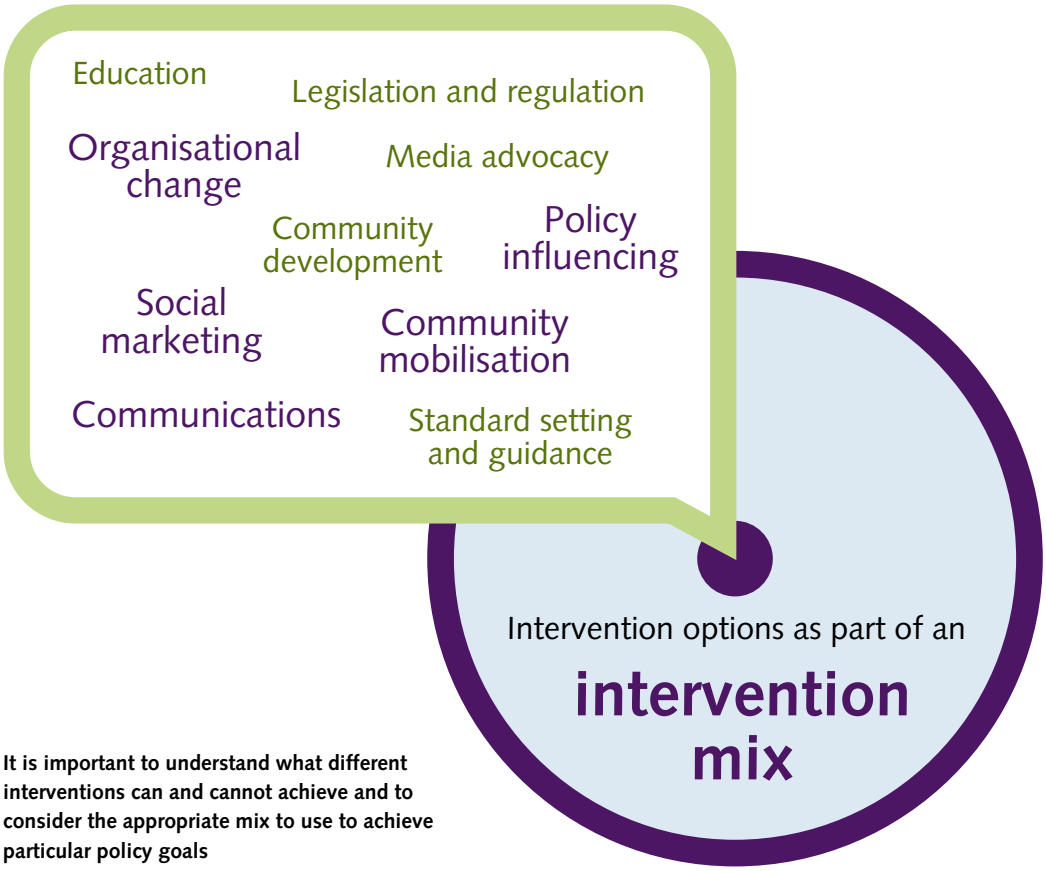
Social marketing takes lessons from commercial marketing and social sector marketing and applies them to the social and health sectors. It puts a detailed knowledge of consumer behaviour at the very heart of the development of behaviour change interventions, campaigns or programmes.

In the health sector the foundation of social marketing is the recognition that simply giving people information and urging them to be healthy is not enough. We need to understand why people act as they do and, therefore, how best to support them in their life choices. As well as merely giving information, it means supporting and encouraging people, fostering in individuals and communities the desire for good health that they already have.

This core idea – starting from where people are and focusing on what help they need to make changes in behaviour – means moving our approach to behaviour change interventions from focusing only on awareness raising strategies to a social marketing approach.

A social marketing approach does not replace other measures. It is not a separate programme of work, it is part of the toolkit that can be used in a strategic way to inform the mix of intervention options, including regulatory action through legislation.

Most definitions of social marketing include three key elements:



1. it is a systematic process that can be phased to address short, medium and long-term issues
2. it uses a range of marketing concepts and techniques (a marketing mix)
3. its aim (which in the case of health-related social marketing is improving health and reducing health inequalities) has clearly identified and targeted specific behavioural goals

Social marketing can help shape policy and its implementation, to promote and encourage positive behaviours and influence the provision of services. The behavioural analysis may indeed result in a need to focus on 'upstream' targets such as professionals and stakeholders to re-orientate health services and service provision.

And with its focus on establishing unambiguous behavioural goals, social marketing can also improve effectiveness measurement and allocation of public funds.

Figure 1: Keeping social marketing in perspective

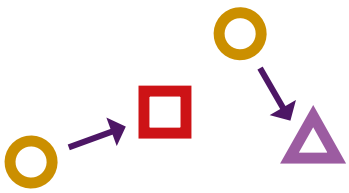
One of a range of potential intervention options, which could include:

It is important to understand what different interventions can and cannot achieve and to consider the appropriate mix to use to achieve particular policy goals

We will develop future interventions that help people manage the many health challenges they face, and enjoy the rewards of better health through the choices they make. In developing this new approach we will put more effort into helping people take the steps that they can to improve their health. We will listen to what people say will help, and put more effort into providing direct practical support. We will also make it easier for partners from the private sector and NGO sector to make a bigger contribution to working with us to improve the nation's health.

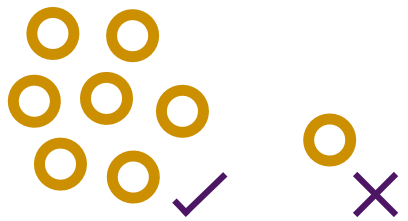
Professor David Harper CBE,
Director General, Health Improvement and Protection, and
Chief Scientist,
Department of Health

How is social marketing different from other approaches?



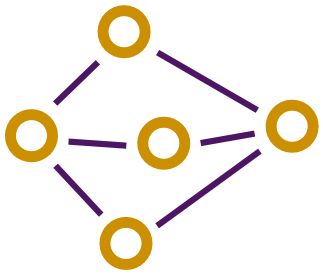
Tackling today's threats to health means examining the way we live. This is a challenge that we have to embrace. We have to see the world as it is. We have to understand the realities of how people live their lives, not make assumptions about how things are.

Personal behaviour is a key determinant of health. We know that people behave in the way they do due to a wide range of influences, some of which they have control over, some of which they cannot directly control. We also know that people do not compartmentalise their lives or their view of health. We need to accept this and recognise the reality that every aspect of our lives relates to health – work, food, education, transport and leisure activities.

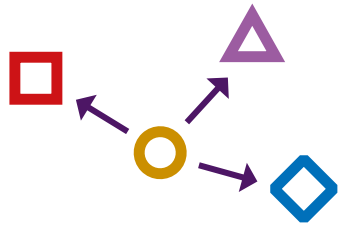


We must be sensitive to people's needs and work with them to make the changes that they can and want to. Why? Because once we do this, we really are better equipped to support people in changing their lifestyles.

In trying to influence health behaviour, it is vital to learn from what has and has not worked. It is now widely understood that just telling people what to do is not enough. It is also clear that most people want to live healthy lives and that the biggest influence on them is their family, friends and peers.



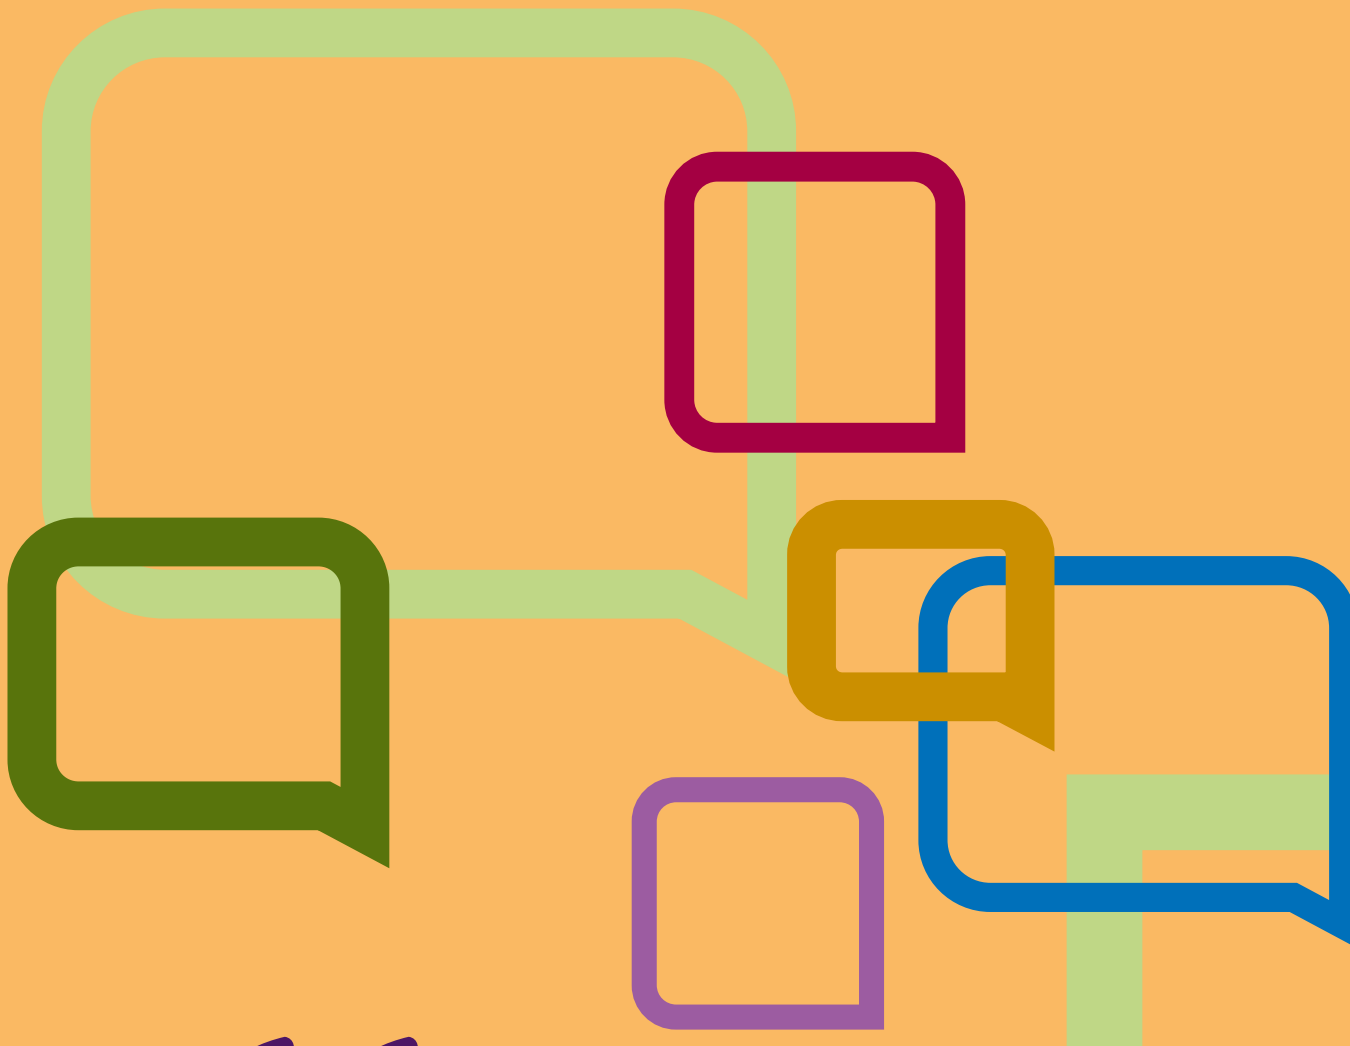
Some of the benefits of social marketing…



Change is voluntary – people are more likely to change their behaviour if they recognise the benefits and they choose to change voluntarily.

Multiple approaches work better than single interventions.

Using intermediaries or partners builds trust – as people can often be distrustful of messages from the Government.



Greater acceptance – by adapting the message to the audience and targeting information and messages in ways people want to receive it.

People only decide to change when they realise that the reward is worth the cost or effort of making the change. So a modern approach to health behaviour improvement must put people firmly in the driving seat. Social marketing is about listening to people, understanding how they want to live their lives, then using that insight to develop behaviour change interventions that they will be able to take on board.

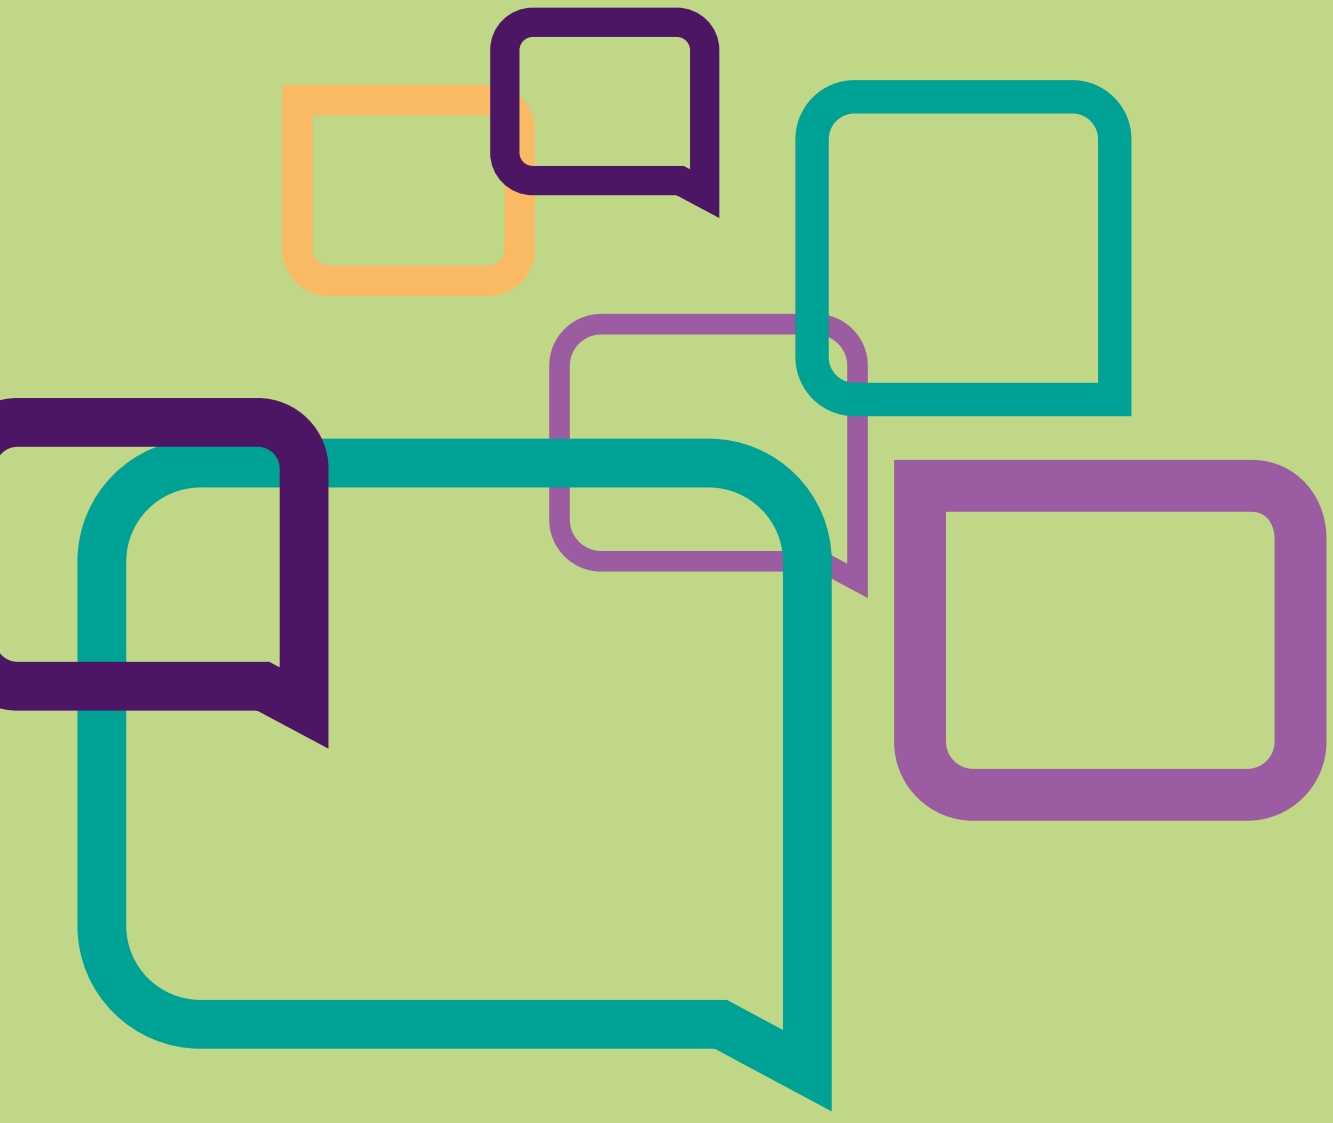
A crucial learning from single-issue campaigns is that people's behaviours are multiple and complex. Research shows that the multiple message or approach often favoured in social marketing will have a greater impact on the ability to influence people and support lasting change.

For example, many negative behaviours are symptomatic of deep-rooted issues relating to self-esteem, and those issues need to be addressed before behaviour change can come about.

Social marketing is not about smarter campaigns or a new function for government departments – it is about a long-term cultural change agenda built on deep user insight that will deliver significant benefits to society and the efficient management of public services.

Ed Mayo, Chief Executive,
New National Consumer Council

Recognising some of the differences between:



Commercial marketers	Social marketers
Primary aim: sales, profit and shareholder value	Primary aim: achieving a 'social good'
Funded from investment and sales	Funded from public funds (e.g. taxes and donations)
Privately accountable (e.g. to shareholders and directors)	Publicly accountable
Performance measured in profits and market share	Performance measures often complex and longer term
Behavioural goals – often clearer to define and more immediate, with stronger short-term measures	Behavioural goals – commonly more complex and challenging, with sustained action over the longer term
More clearly defined products or services which are less complex to market	Products or services often focused on addressing complex, challenging or controversial behaviours
Often accessible targets and audiences	Often challenging high-risk targets and audiences
Commercial culture – risk-taking culture often evident	Public sector culture – risk-averse culture often evident
Hierarchical decision-making widely assumed	Participatory decision-making valued
Relationships commonly competitive	Relationships often based on building trust

The Choosing Health White Paper recognised that business, the media and third sector organisations are often more successful in getting information across to people than governments or public sector-led campaigns. A key component of social marketing is the leveraging of partnerships with non-governmental organisations through new and innovative ways of working.

The Drinkaware Trust, a partnership between government, the devolved administrations and the Portman Group, is one example of this. This new-model organisation represents a unique opportunity for industry and non-industry stakeholders to work together in common cause to tackle alcohol-related harm. Another example is the Food Standards Agency's 'traffic lights' food labelling initiative, which has been adopted by several major retailers including Sainsbury's, ASDA, Co-op and Waitrose.

Social marketing offers practitioners and policy-makers a toolkit of approaches and interventions with which to empower individuals and communities, and create the conditions in which they can make healthier choices.

In today's world people expect choice and convenience in the advice and support available to them to prevent ill-health. They don't like being nagged, nor receiving advice 'from on high'.

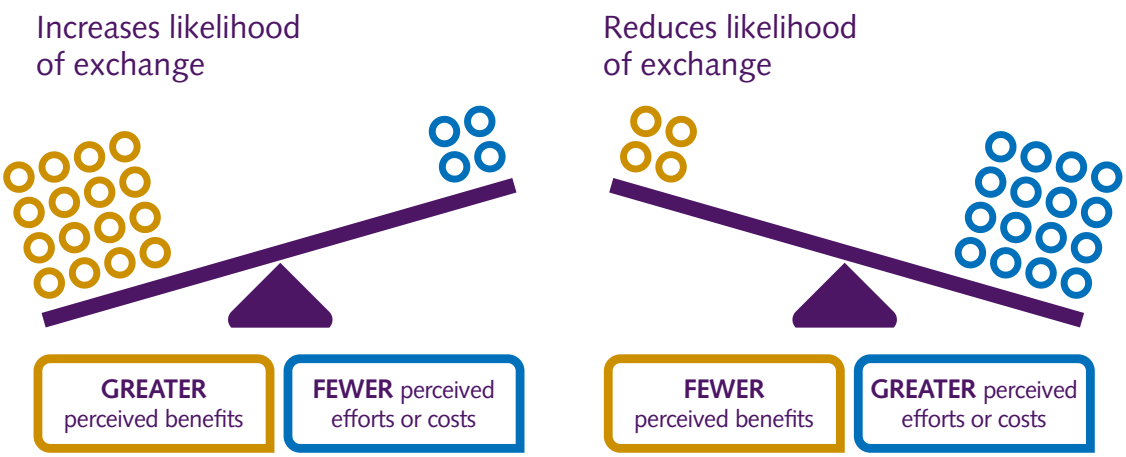
The potential of social marketing

In 2006, in response to *Choosing Health, It's Our Health!*, an independent review of the potential of social marketing to help promote health throughout England, was produced in partnership with the National Consumer Council. The review's recommendation in formed the basis of the Department's social marketing strategic framework, and puts this country at the forefront of social marketing practice in having the world's first systematic approach to applying social marketing principles to health improvement.

It's Our Health! was compiled after discussions with a wide range of policy-makers, practitioners and academics across different sectors at national, regional and local levels and a research programme of 12 individual reviews. The team gave 148 workshop sessions and seminars that reached over 5000 people. Participants were encouraged to give their views about how individual and collective work to promote health could be enhanced, and how social marketing could support them.

For the full report go to **www.nsms.org.uk/public/default.aspx?PageID=16**

It's Our Health! found that social marketing had real and significant potential to improve the impact and effectiveness of health behaviour change interventions at all levels.



Social marketing benchmark criteria

Working with the Department of Health, the National Social Marketing Centre has developed a tool for England for identifying social marketing in practice. French, Blair-Stevens (2006) based this on the original benchmark criteria developed by Alan Andreasen (2002).

Benchmark	What to look for
1. Clear focus on behaviour, with specific behaviour goals	• Intervention clearly seeks to impact on behaviour with specific and measurable goals • Key performance indicators have been established • Fuller approach adopted (beyond just changes in behaviour)
2. Uses consumer and/or market research	• Formative consumer/market research used to identify audience characteristics and needs • Range of different research techniques and data synthesis methods used, from public and commercial sector sources, to inform development
3. Is theory based and informed	• Transparent use of theory – the theoretical underpinning of work is clear • Mixed theory-based approach used to underpin and inform the development of interventions

Benchmark	What to look for
4. Is insight driven	• Focus is clearly on gaining a deep understanding and insight into what moves and motivates the consumer • Approach based on identifying and developing 'actionable insights' using considered judgement, rather than simply generating more data and intelligence
5. Uses exchange concept (see Figure 2 below)	• Clear analysis of the full cost to the consumer in achieving the proposed benefit (financial, physical, social, etc.) • Analysis of the perceived costs versus perceived benefits • Incentives, recognition, reward, and disincentives are considered and tailored according to specific audiences

Figure 2: The 'Exchange' concept

Benchmark	What to look for
6. Uses competition concept	• Both internal and external competition addressed • Strategies employed to minimise the potential impact of competition
7. Uses a segmentation approach (not just targeting)	• Beyond a simple demographic or epidemiological targeting • Segmented approaches that focus on what motivates the target audience using psycho-graphic data • Interventions tailored directly to specific audience segments • Future lifestyle trends addressed
8. Integrates a mix of methods ('intervention mix' or 'marketing mix')	• Range of methods used to establish an appropriate mix of marketing methods • Avoids reliance on single methods or approaches used in isolation • Methods and approaches developed taking full account of any other interventions in order to achieve synergy and enhance the overall impact

Social marketing
National Benchmark Criteria

National Social Marketing Centre

Benchmark	What to look for
1. CUSTOMER ORIENTATION ***'Customer in the round'*** **Develops a robust understanding of the audience, based on good market and consumer research, combining data from different sources**	• A broad and robust understanding of the customer is developed, which focuses on understanding their lives in the round, avoiding potential to only focus on a single aspect or features • Formative consumer / market research used to identify audience characteristics and needs, incorporating key stakeholder understanding • Range of different research analysis, combining data (using synthesis and fusion approaches) and where possible drawing from public and commercial sector sources, to inform understanding of people's everyday lives
2. BEHAVIOUR **Has a clear focus on behaviour, based on a strong behavioural analysis, with specific behaviour goals**	• A broad and robust behavioural analysis undertaken to gather a rounded picture of current behavioural patterns and trends, including for both *– the 'problem' behaviour* *– the 'desired' behaviour* • Intervention clearly focused on specific behaviours *ie not just focused on information, knowledge, attitudes and beliefs* • Specific actionable and measurable behavioural goals and key indicators have been established in relation to a specific 'social good' • Intervention seeks to consider and address four key behavioural domains: *1: formation and establishment of behaviour;* *2: maintenance and reinforcement of behaviour;* *3: behaviour change;* *4: behavioural controls (based on ethical principles)*
3. THEORY **Is behavioural theory-based and informed. Drawing from an integrated theory framework**	• Theory is used transparently to inform and guide development, and theoretical assumptions tested as part of the process • An open integrated theory framework is used that avoids tendency to simply apply the same preferred theory to every given situation • Takes into account behavioural theory across four primary domains: *1: bio-physical;* *2: psychological;* *3: social;* *4: environmental / ecological*
4. INSIGHT **Based on developing a deeper 'insight' approach – focusing on what 'moves and motivates'**	• Focus is clearly on gaining a deep understanding and insight into what moves and motivates the customer • Drills down from a wider understanding of the customer to focus on identifying key factors and issues relevant to positively influencing particular behaviour • Approach based on identifying and developing *'actionable insights'* using considered judgement, rather than just generating data and intelligence
5. EXCHANGE **Incorporates an 'exchange' analysis. Understanding what the person has to give to get the benefits proposed**	• Clear analysis of the full cost to the consumer in achieving the proposed benefit (financial, physical, social, time spent, etc.) • Analysis of the perceived / actual costs versus perceived / actual benefits • Incentives, recognition, reward, and disincentives are considered and tailored according to specific audiences, based on what they value
6. COMPETITION **Incorporates a 'competition' analysis to understand what competes for the time and attention of the audience**	• Both internal & external competition considered and addressed *– Internal* eg psychological factors, pleasure, desire, risk taking, addiction etc *– External* eg wider influences / influencers competing for audience's attention and time, promoting or reinforcing alternative or counter behaviours • Strategies aim to minimise potential impact of competition by considering positive and problematic external influences & influencers • Factors competing for the time and attention of a given audience considered
7. SEGMENTATION **Uses a developed segmentation approach (not just targeting). Avoiding blanket approaches**	• Traditional demographic or epidemiological targeting used, but not relied on exclusively • Deeper segmented approaches that focus on what *'moves and motivates'* the relevant audience, drawing on greater use of psycho-graphic data • Interventions directly tailored to specific audience segments rather than reliance on 'blanket' approaches • Future lifestyle trends considered and addressed
8. METHODS MIX **Identifies an appropriate 'mix of methods'** 'Intervention mix' = Strategic SM 'Marketing mix' = Operational SM	• Range of methods used to establish an appropriate mix of methods • Avoids reliance on single methods or approaches used in isolation • Methods and approaches developed, taking full account of any other interventions in order to achieve synergy and enhance the overall impact • Four primary intervention domains considered: *1: informing / encouraging;* *2: servicing / supporting;* *3: designing / adjusting environment;* *4: controlling / regulating*

French, Blair-Stevens (2006) adapted from original benchmark criteria developed by Andreasen (2002)

Social marketing
National Benchmark Criteria

National Social Marketing Centre

The benchmark criteria are essentially those elements to look for in an intervention to determine whether it is consistent with social marketing.

They have been developed to help strengthen the use of effective social marketing approaches. They were developed following a two year independent review in 2006 which examined social marketing methods and approaches. The review identified that there was an increasing tendency for work to describe itself as social marketing without necessarily reflecting social marketing core concepts and principles. The eight point benchmark criteria built on the review findings and also Alan Andreasen's previous six point benchmark from 2001.

The benchmarks are designed to support the following:

- to increase understanding of core social marketing concepts and principles
- to increase consistency of approach and thereby their potential impact and effectiveness
- to maintain maximum flexibility and creativity, to craft and develop interventions to different needs
- to assist more systematic capture and sharing of transferable learning between interventions
- to assist effective review and evaluation of different types of intervention

It is important that the benchmarks are not confused with a process of how to do social marketing. There are other models such as the 'total process planning' approach which places a strong emphasis on the front-end 'Scoping' stage. Instead the benchmarks are essentially the key elements that should be in place if an intervention is to accurately describe itself as social marketing.

The benchmarks have been framed in such a way as to ensure that they do not restrict the ability of practitioners to develop creative, imaginative and flexible solutions to the different types of behavioural challenges they face. However the criteria provide a robust framework to assist those planning and developing interventions to ensure they are consistent with best evidence-based principle and practice in the social marketing field.

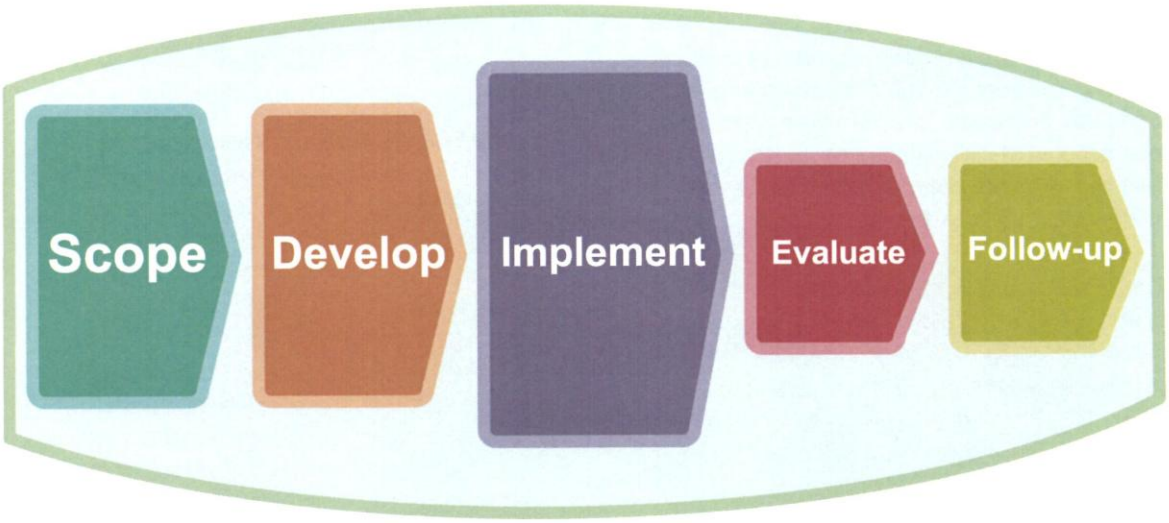
Finally it is important to note the reason why other factors, which are critical to any successful intervention have not been included. Obvious examples would include: **strategic planning, partnership and stakeholder engagement, review and evaluation**, (to name a few). These are clearly all important in there own right, and key to successful interventions. The reason they are not part of the benchmarks is that they are not unique to social marketing. Their presence (or absence) does not indicate if something is social marketing or not. The eight criteria included in the benchmark are however, the things that have to be present in order to be described as consistent with social marketing.

Different ways that the National Benchmark Criteria can be used

Commissioners:
Can use them to incorporate into tender briefs and send them to people wanting to bid for specific work, with a request that all proposals or bids should clearly indicate how the work proposed will ensure it incorporates, and is consistent with, each of the criteria. They can then be used in preparing tender interview panel questions, to test out the extent to which those making bid presentations have understood and genuinely incorporated them into their proposals.

Agencies, consultants & other contractors:
Can use the benchmark as a guide to presenting bids or proposals to funders, to clearly show how their proposal or bid will be consistent with social marketing principles and practice.

Intervention planners and developers:
Can use these as a robust guide to ensure what they do is consistent with core criteria. As core criteria they have been specifically framed to allow maximum flexibility for adaptive and creative solutions. However while they are not a 'how to' process they provide a steer to ensure that, as work is developed, it can be checked to ensure it is consistent with the core components of social marketing.



Evaluators & researchers:
Can use them when reviewing the impact of interventions, to reinforce the focus on determining if specific behavioural impacts have been achieved or not. They can also be used by those seeking to compare and contrast learning from different interventions and programmes and to help identify aspects of transferable learning.

Trainers:
Can use them to highlight key features of social marketing and provide a framework from which to examine and explore key concepts and principles.

National
Social Marketing
Centre

Planning framework

Behavioural Interventions and Social Marketing

Total Process Planning (TPP) framework

This is a short overview of a straight-forward planning framework (TPP), spotlighting some core features and tasks.

It provides a practical framework in which to plan and manage the range of tasks required when developing and delivering effective behavioural interventions, based on core social marketing principles.

While the main stages (Scope, Develop, Implement, Evaluate, Follow-up) should be considered as sequential, the way tasks are undertaken and managed within each stage are rarely such. Undertaking them requires a flexible approach tailored to different circumstances and contexts.

A fuller Planning Guide and related resources and tools are currently being developed and will be available later in the year. Visit **www.nsmcentre.org.uk** for details.

Introduction

The TPP framework begins with the premise that there are always a range of ways to develop, manage and undertake work. No single checklist or tool will be able to cover every situation.

Though there are a growing number of practical planning tools and guides available, we have found that in practice, people adjust approaches to take account of their different circumstances and their own professional skills and expertise directly influences what they do.

The TPP framework therefore seeks to respond to and reflect this reality and to provide a robust framework within which more complex coordination of tasks and components can be managed.

Key things to highlight about the Total Process Planning (TPP) framework:

- The simplicity of the core stages provide a way of managing the complexity that can be involved in developing effective interventions.
- It is important to keep the main stages clear and distinct rather than letting stages overlap. (e.g. moving into 'Developing' before proper 'Scoping' has been undertaken).
- While each stage should be clear and distinct, what happens within them rarely is. A range of tasks often need to be undertaken and coordinated in parallel so that elements of each can influence the other.

Your work, experience and expertise

The NSM Centre is always keen to hear about tools and resources people use in their work, and particularly the ones people develop or adapt specifically to undertake tasks. We are currently working on a full Planning Guide and series of practical tools and resources.

We would therefore be pleased to hear about, and learn from, you. Our own resource and tool development work has already benefited from a wide range of contributions and we will always acknowledge and highlight peoples' work where it can assist and support others.

Visit our website www.nsmcentre.org.uk for further information on our work.

Join the Social Marketing e-Network and receive an e-Bulletin every two months to update you on developments. We can be emailed at info@nsmcentre.org.uk.

Partnership and co-delivery

Some key things to keep in mind:

Investing time, effort and resources in scoping is key to success. While there can be real pressures to get started before a scoping exercise has been done, this is a sure fire way to waste valuable resources and limit the potential impact of work.

When commissioning at any level (whether a programme, campaign or intervention) we strongly recommend that this is not done as a single all encompassing contract. Good commissioning, (consistent with World Class Commissioning in England), should be based on a sound assessment of needs and a consideration of the methods most likely to achieve the given behavioural goals.

A cautious view should be taken with any agency (whether from the voluntary or business sectors) that presents a proposal without first having undertaken, or had access to, a proper Scoping exercise. For this reason we recommend that commissioners and funders of work separate out commissioning into distinct stages:

Commissioning Stage 1:
Undertaking a scoping exercise (commissioning all or part of this if necessary).

Commissioning Stages 2 & 3:
Commissioning the development work and where relevant separately commissioning the subsequent implementation and delivery work (or parts of it).

This distinction will help ensure that no assumptions are made about what will be most effective in influencing and sustaining positive behaviours amongst the given audience(s). For example, it can be easy to assume that some type of communications or social advertising approach is required before looking at what is most likely to actually influence specific behaviours. In practice it is more common to conclude that a range of different elements will be required. A proper scoping stage will help to directly inform the relevant mix of intervention methods and approaches.

The benefits of effective Scoping

As well has helping to prevent the rush to a simple 'communications' approach, undertaking a proper 'Scoping' stage can help in a number of important ways:

Proper scoping can:

a) Significantly enhance effective stakeholder engagement and involvement.
Whatever the methods or approaches being used, it is the stakeholders who represent one of the most important resources and assets available. Their effective engagement will be key to development, implementation and success, whatever approaches are adopted.

b) Directly assist subsequent review and evaluation
Scoping allows assumptions informing selection of methods and approaches to be set out, and this assists in the selection of appropriate baseline data, to aid future evaluation.

c) Help to directly enhance the evidence base and help others learn and benefit from the work
Access to Scoping reports can assist others in being able to consider and plan their own interventions. Many people are addressing identical challenges. Being able to readily access the work and intelligence drawn together by others, can be a hugely valuable resource. This has the potential to speed up the planning and development of future work.

A strong focus on the individual…

but always in their wider social context

Understanding what will ‘move and motivate’ people

SCOPING

Where you examine the issue or challenge, build a robust understanding of the audience and the behaviour involved. You consider the resources (human and financial) available, and select the intervention approaches and options believed most likely to have a positive impact on the lives of those being addressed.

Typically Scoping will include:

1: Getting Started – getting people together; reviewing expectations / requirements; writing a 'Challenge statement'

2: Assessing the Assets

3: Engaging and mobilising Stakeholders

4: Understanding the audience(s) / customer(s)

5: Understanding the behaviour and what influences it

6: Intervention option selection

7: Writing up a 'Scoping Report'

Key tasks include:

'EXPECTATIONS REVIEW' & 'CHALLENGE STATEMENT'

- Reviewing the expectations and drivers for action, and writing an initial 'Challenge Statement'.

TEAM & STAKEHOLDER development

- Investing time and effort in the people who will be crucial to the success of any work undertaken

S.W.O.T. & S.T.E.P. ANALYSIS

- Examining the **S**trengths, **W**eaknesses, **O**pportunities and **T**hreats (SWOT)
- Informed by assessment of key **S**ocial, **T**echnological, **E**nvironmental and **P**olitical (STEP) factors.

EXISTING KNOWLEDGE REVIEW

- Identifying existing knowledge and learning, e.g. literature reviews as well as capture of stakeholder views and intelligence.

ASSETS AUDIT

- Identifying what resources (human and financial) can be mobilised.

Initial AUDIENCE(s) PROFILING & SEGMENTATION

- Establishing a rounded picture of the people's lives, what is important to them.
- Identifying what intelligence and data sources exist and the ways to bring them together to aid in understanding people's lives.
- Identifying key influences and influencers on the relevant audience(s).
- Developing targeting and deeper segmentation of the audience(s).
- Establishing initial audience 'insights' into what is likely to 'move and motivate' them.

Initial BEHAVIOURAL ANALYSIS – looking at

- The WHAT? Establishing an understanding of both the current desired and the current problem behaviours (including any anticipated trends or patterns).
- BEHAVIOUR CLUSTERING – Identifying clusters of similar types of behaviour.
- The WHY? Examining reasons why both the desired and the problem behaviours occur.
- Initial EXCHANGE, ANALYSIS & REWARDS & COSTS REVIEW (Benefits/Rewards & Costs/ Barriers) – assessing what rewards people get for both the desired and the problem behaviour and:
  - For desired behaviour = increasing rewards /benefits and decreasing barriers / costs to the behaviour
  - For problem behaviour = decrease the rewards / benefits and increasing the barriers / costs to the behaviour

COMPETITION ANALSYIS

- Considering what other behaviour may be competing for the time and attention of the audience (may have nothing to do with the target behaviour itself).
- Considering whose influence is competing – specific people or organisation or forces.

INTERVENTION OPTIONS REVIEW & 'mix' selection

- Considering what intervention options to progress and 'the mix' or balance between different elements given available resources.

BEHAVIOURAL POSITIONING & GOALS establishment

- Behavioural Positioning – Considering how to position the desired and problem behaviours.
- Behavioural Goals – Developing SMART behavioural goals: **S**pecific, **M**easurable, **A**chievable, **R**ealistic, **T**ime-bound.

DEVELOPMENT

The stage where the behavioural goals and audience insights from 'Scoping' are taken and developed into a programme, campaign or intervention. This includes specific pre-testing of ideas and options with the audience(s), and checking if the evidence and assumptions made during Scoping are relevant and actionable.

The details of this stage will vary according to the intervention options selected during Scoping. While this might include a media campaign approach it is equally important to consider other options such as: service development/design; physical environmental changes; policy and strategy changes etc.

Key here is ensuring it is *customer understanding and insight* that drives selection of the intervention options and the mix of these. Rarely are single interventions enough to influence and sustain behaviour.

It is important at this stage to avoid addressing people in isolation, and always consider them in their wider social, community and societal contexts. Consider the factors both within, and outside of, their immediate control.

Key tasks include:

Further STAKEHOLDER ENGAGEMENT

- Focusing on their contribution to the Development stage and preparation work ahead of future Implementation stage.

Further BEHAVIOURAL ANALYSIS

- Building on work done in Scoping, to ensure more detailed understanding of, and agreement to, the behavioural goals.

INTERVENTION or 'PRODUCT' development

- Examining whatever methods and approaches have been selected and developing these in a way that will be appealing and motivating to the audience(s).
- Drawing on 'Exchange' theory to consider the potential 'Marketing Mix' sometimes described as the '4 P's of marketing:
  - Product: Useful to consider what is being proposed as if it were 'a product'. It is useful to distinguish between:
    - *Core product* Direct benefits to the audience for undertaking the desired behaviour.
    - *Actual product* The features of the product (eg clinic service, community campaign, etc)
    - *Augmented product* Specific things that support, service or assist adopting and maintaining the behaviour.
  - Price: Reducing the cost (not just financial also time, effort, social impact etc) and increasing the value or benefits of the desired behaviour.
  - Place: Considering both a) where the behaviour occurs and what can be done to address the context, as well as b) where the audience can most effectively be engaged e.g. different settings and geographic locations.
  - Promotion: Putting together a tailored package to communicate, promote or encourage the desired behaviour.

COMMUNICATIONS approaches

- It should not be assumed that these will be required, but where they are, they need to consider:
  - 'MESSAGE(S)' development – Crafting empowering and actionable messages. But only if judged likely to impact positively on the relevant behaviour.
  - BRANDING and positioning issues – Considering how to present issues and ideas and review who are best placed to be the 'message givers' (Not always the lead agency or those leading the development work).

PRE-TESTING

- Ensuring all evidence-based assumptions made to date are tested out with the audience, and plans adjusted as required. Always allowing for the possibility of radical adjustment to plans where audience feedback indicates this is necessary if goals are to be achieved.

Working to develop deeper understanding and insight into peoples lives to inform and drive all development

IMPLEMENTATION

Going 'live' with the programme, campaign or intervention. This will vary according to what approaches and methods were selected in the Scoping and Developing stages.

Key tasks include:

Tracking initial and on-going responses

- Covering both the primary audience (those being targeted) and secondary audiences (those around them as key influences, eg: family, community leaders, different types of media). Adjusting and tailoring approaches based on feedback.

Opportunity spotting

- Typically during 'Implementation' new opportunities and possibilities become available and need to be actively considered and capitalised on.

Threat management

- Looking at factors that may be negatively impacting on the Implementation stage and ensuring handling strategies are in place to remove or minimise their impact.

Continued stakeholder engagement and mobilisation

- Maintaining and developing key stakeholders (relevant to the implementation stage) including active 'praising and thanking strategies'.

Information and data recording and capture

- Ensuring intelligence and data is captured ready for future review and evaluation.

EVALUATION

The stage at which the aim(s) and objectives of the work are revisited and the data captured is examined to assess the impact of the work so far.

In practice evaluation is as much a 'mind-set' as it is a formal stage. Scoping properly from the start provides one of the most valuable factors to assist effective review and evaluation.

A key output here should be an evaluation report. This should set out the original aims and objectives, the methods used, the impacts identified and a provisional set of recommendations for further action.

Ultimately in social marketing this should always focus on tracking actual impacts on behaviour. While this can present real challenges, particularly if assessment may need to stretch over many years, nevertheless it is important to move beyond just relying on knowledge or attitudinal indicators. Sometimes it is possible to look at proxy indicators that help indicate movement towards behavioural goals.

While researchers and academics can provide help in evaluation it is also valuable to include participative evaluation approaches to the input from key stakeholders. Some aspects of evaluation to consider include:

IMPACT evaluation

- Assessing the extent to which the stated aims and objectives – and specifically the behavioural goals – of the work have been achieved, drawing on short, medium and longer term indicators.
- Considering each of the following:
  - Knowledge – the extent to which information was understood.
  - Attitudes – the extent to which information was valued and incorporated into people's attitudes and values.
  - Behaviour - the extent to which people have made changes to behaviour or been able to sustain positive behaviours.

PROCESS evaluation

- Assessing the process and capturing learning from the work (at Scoping, Development and Implementation stages).
- Considering such factors as: efficiency; effectiveness; equity; quality; engagement and management processes.
- Engagement and views of key parties, e.g. the funders and commissioners of the work; the team undertaking the work; and key stakeholders.

COST BENEFIT ASSESSMENT

- As well as trying to assess how effective work has been, it is also important to consider the cost-effectiveness and cost-benefit of how resources have been used or assets mobilised

FOLLOW-UP

Where the results of the evaluation are considered and can inform future work, as well as help promote learning and enhance the evidence-base.

This stage can commonly be lost or overlooked. Often the relief at completion of work and the pressures from other on-going priorities means that this stage gets merged into general discussions and it can be difficult subsequently to see how the review and evaluation findings were responded to and how this influenced further development work.

Examples of what this can involve include:

- Holding a dedicated review session when key stakeholders are brought together with the researchers who completed any formal evaluation to review the findings. Providing an opportunity for those involved to comment on and question findings.
- Holding key decision-maker and/or commissioner sessions to discuss the findings and provide opportunity to reflect on findings and implications for on-going strategy development and future commissioning.
- Actively considering achievements to date and ways these can be maintained and further built on.
- Looking into the medium and longer term and how next steps can build on the work so far.
- Recording and capturing stakeholder views (including funders and commissioners) to sit alongside any formal evaluation report.
- Taking dedicated time to acknowledge and thank those involved for their contributions.
- Promoting and increasing access to the learning from the work. For example:
  - Getting information on the work onto relevant practice databases or similar resources, looking at formal publishing opportunities, for the evaluation and other articles or reports.

Help us develop this and other resources

We are always keen to work with people who would like to trial our resources and tools and help us continue to refine and development them.

If you would like to trial this Planning Framework in your work please email us at the address below so we can discuss possibilities

Social Marketing – 8 point National Benchmark Criteria

Social marketing
National Benchmark Criteria

National Social Marketing Centre

Benchmark	What to look for
1. CUSTOMER ORIENTATION 'Customer in the round' Develops a robust understanding of the audience, based on good market and consumer research, combining data from different sources	• A broad and robust understanding of the customer is developed, which focuses on understanding their lives in the round, avoiding potential to only focus on a single aspect or features • Formative consumer / market research used to identify audience characteristics and needs, incorporating key stakeholder understanding • Range of different research analyses, combining data (using synthesis and fusion approaches) and where possible drawing from public and commercial sector sources, to inform understanding of people's everyday lives
2. BEHAVIOUR Has a clear focus on behaviour, based on a strong behavioural analysis, with specific behaviour goals	• A broad and robust behavioural analysis undertaken to gather a rounded picture of current behavioural patterns and trends, including for both: – the 'problem' behaviour – the 'desired' behaviour • Intervention clearly focused on specific behaviours *ie not just focused on information, knowledge, attitudes and beliefs* • Specific actionable and measurable behavioural goals and key indicators have been established in relation to a specific 'social good' • Intervention seeks to consider and address four key behavioural domains: *1: formation and establishment of behaviour; 2: maintenance and reinforcement of behaviour;* *3: behaviour change; 4: behavioural controls (based on ethical principles)*
3. THEORY Is behavioural theory-based and informed – draws from an integrated theory framework	• Theory is used transparently to inform and guide development, and theoretical assumptions tested as part of the process • An open integrated theory framework is used that avoids tendency to simply apply the same preferred theory to every given situation • Takes into account behavioural theory across four primary domains: *1: bio-physical; 2: psychological;* *3: social; 4: environmental / ecological*
4. INSIGHT Based on developing a deeper 'insight' approach – focusing on what 'moves and motivates'	• Focus is clearly on gaining a deep understanding and insight into what moves and motivates the customer • Drills down from a wider understanding of the customer to focus on identifying key factors and issues relevant to positively influencing particular behaviour • Approach based on identifying and developing 'actionable insights' using considered judgement, rather than just generating data and intelligence
5. EXCHANGE Incorporates an 'exchange' analysis. Understanding what the person has to give to get the benefits proposed	• Clear analysis of the full cost to the consumer in achieving the proposed benefit (financial, physical, social, time spent, etc.) • Analysis of the perceived / actual costs versus perceived / actual benefits • Incentives, recognition, reward, and disincentives are considered and tailored according to specific audiences, based on what they value
6. COMPETITION Incorporates a 'competition' analysis to understand what competes for the time and attention of the audience	• Both internal and external competition considered and addressed – *Internal* eg psychological factors, pleasure, desire, risk taking, addiction etc – *External* eg wider influences / influencers competing for audience's attention and time, promoting or reinforcing alternative or counter behaviours • Strategies aim to minimise potential impact of competition by considering positive and problematic external influences and influencers • Factors competing for the time and attention of a given audience considered
7. SEGMENTATION Uses a developed segmentation approach (not just targeting) – avoids blanket approaches	• Traditional demographic or epidemiological targeting used, but not relied on exclusively • Deeper segmented approaches that focus on what 'moves and motivates' the relevant audience, drawing on greater use of psycho-graphic data • Interventions directly tailored to specific audience segments rather than reliance on 'blanket' approaches • Future lifestyle trends considered and addressed
8. METHODS MIX Identifies an appropriate 'mix of methods' 'Intervention mix' = Strategic SM 'Marketing mix' = Operational SM	• Range of methods used to establish an appropriate mix of methods • Avoids reliance on single methods or approaches used in isolation • Methods and approaches developed, taking full account of any other interventions in order to achieve synergy and enhance the overall impact • Four primary intervention domains considered: *1: informing / encouraging; 2: servicing / supporting;* *3: designing / adjusting environment; 4: controlling / regulating*

French, Blair-Stevens (2006) adapted from original benchmark criteria developed by Andreasen (2002)

This sheet summarises eight key features to assess if work is consistent with core social marketing principles. It can be used at different stages to support effective commissioning, development, implementation and evaluation.
